PATIENT MATTERS MANUAL
TABLE OF CONTENTS

CHAPTER 1 - ANAESTHETICS	PD/IB/GL NUMBER	Page No.
Principles of Anaesthetic Care		1.1
Pre-Anaesthetic Consultation		1.1
Administration of Drugs Specifically to Produce Coma		1.1
Major Regional Anaesthesia		1.2
Anaesthetic Machines		1.3
CHAPTER 2 - PAEDIATRICS	**PD/IB/GL NUMBER**	**Page No.**
Newborn Bloodspot Screening Policy	PD2016_015	2.1
Breastfeeding in NSW: Promotion Protection and Support	PD2018_034	2.16
Breastmilk – Safe Management	GL2023_021	2.23
Apnoea Monitors	GL2012_002	2.24
Growth Assessment in Children and Weight Status Assessment in Adults	GL2017_021	2.24
Circumcision of Normal Infant Males	PD2020_035	2.25
Tiered Networking Arrangements for Perinatal Care in NSW	PD2023_035	2.26
NSW Paediatric Service Capability Framework	GL2017_010	2.27
Maternity and Neonatal Service Capability	GL2022_002	2.28
Humidified High Flow Nasal Cannula Oxygen Guideline for Metropolitan Paediatric Wards and EDs – 1st Edition	GL2016_004	2.29
Infants and Children Insertion and Confirmation of Placement of Nasogastric and Orogastric Tubes	GL2016_006	2.30
Management of Sudden Unexpected Death in Infancy (SUDI)	PD2019_035	2.31
Recommended Safe Sleep Practices for Babies	GL2021_013	2.49
Management of Cerebral Palsy in Children - A Guide for Allied Health Professionals	GL2018_006	2.50
Feeding Difficulties in Children - A Guide for Allied Health Professionals	GL2016_007	2.51
Suspected Child Abuse and Neglect (SCAN) Medical Protocol	GL2014_012	2.52
Neonatal Abstinence Syndrome Guidelines	GL2013_008	2.53
Rural Paediatric Emergency Clinical Guidelines, Third Edition	GL2021_011	2.55
Standards for Paediatric Intravenous Fluids: NSW Health (Second Edition)	GL2015_008	2.56
Standards for Paediatric IV Fluids	IB2014_066	2.57
Infants and Children: Acute Management of Altered Consciousness in Emergency Departments	GL2014_019	2.59
Infants and Children: Acute Management of Community Acquired Pneumonia	GL2018_007	2.60
Statewide Infant Screening – Hearing (SWISH) Program	GL2010_002	2.61
Safety and Wellbeing of Children and Adolescents in NSW Acute Health Facilities	PD2022_053	2.62
Guidelines for Hospitals and Maternity Staff in Their Response to Parents Considering the Adoption of Their Child	PD2005_545	2.75
Minimisation of Neonatal Early Onset of Group Streptococcus GBS Sepsis	GL2017_002	2.92
NSW Paediatric Clinical Care and Inter-hospital Transfer Arrangements	PD2023_019	2.93
Neonatal Consultation, Referral and Transfer Arrangements in Collaboration with NETS	IB2020_015	2.95
Paediatric Clinical Practice Guideline	IB2020_041	2.96
Management of Infants and Children with Congenital Talipes Equinovarus	GL2014_014	2.97
Infants and Children: Acute Management of Bronchiolitis	GL2018_001	2.98

CHAPTER 2 - PAEDIATRICS		
Infants and Children: Acute Management of Sore Throat	GL2014_021	2.99
Youth Health and Wellbeing Assessment Guideline	GL2018_003	2.100
Infants and Children: Initial Management Fever or Suspected Infection- Oncology and Stem Cell Transplantation	GL2015_013	2.102
Paediatric Procedural Sedation - Guide for Emergency Departments, Wards, Clinics and Imaging	GL2018_011	2.103
Jaundice Identification and Management – Neonates - >32 weeks	GL2016_027	2.104
Hypoxic ischaemic encephalopathy in newborns - recognition, monitoring and early management	IB2023_028	2.105
Child Wellbeing and Child Protection Policies and Procedures for NSW Health	PD2013_007	2.106
Statewide Eyesight Preschooler Screening (StEPS) Program	PD2018_015	2.108
Paediatric Procedural Sedation - Guide for Emergency Departments, Wards, Clinics and Imaging	GL2018_011	2.121
New Street Service Policy and Procedures	PD2018_035	2.122
Pasteurised Donor Human Milk for Vulnerable Infants	PD2018_043	2.123
The First 2000 Days Framework	PD2019_008	2.125
First 2000 Days Implementation Strategy	IB2021_011	2.125
Maternity - Management of Monochorionic Twin Pregnancy	GL2020_011	2.126
Management of Positional Plagiocephaly by Allied Health Professionals	GL2020_013	2.127
Clinical Determination for Boarder Baby Registration	GL2020_020	2.128
Syphilis in Pregnancy and Newborns	PD2023_029	2.129
CHAPTER 3 – CHAPLAINCY SERVICES	PD/IB/GL NUMBER	Page No.
NSW Health & Civil Chaplaincies Advisory Committee NSW Memorandum of Understanding	PD2011_004	3.1
Chaplaincy Services and Privacy Law	IB2008_044	3.1

CHAPTER 4 – DENTAL CARE	PD/IB/GL NUMBER	Page No.
Eligibility Of Persons For Public Oral Health Care In NSW	PD2017_027	4.1
Oral Health Fee for Service Scheme	PD2016_018	4.5
Schedule of fees for oral health fee for service scheme	IB2023_015	4.18
Oral Health Patient Record Protocol	GL2015_017	4.19
Oral Health Specialist Referral Protocols	PD2011_071	4.36
Dental Amalgam Clinical Use and Disposal	GL2020_015	4.54
Emergency Department Dental Referrals	GL2023_005	4.55
Early Childhood Oral Health Guidelines for Child Health Professionals, 3RD Edition	GL2014_020	4.56
Early Childhood Oral Health (ECOH) Program: The Role of Public Oral Health Services	PD2013_037	4.57
Priority Oral Health Program (POHP) and Waiting List Management	PD2017_023	4.63
Smoking Cessation Brief Intervention in Oral Health Settings	PD2021_016	4.80
Oral Health: Cleaning, Disinfecting and Sterilising	PD2013_024	4.81
Growth Assessment and Dietary Advice in Public Oral Health Services	GL2019_001	4.91
Teledentistry	GL2020_019	4.92
CHAPTER 5 – DEVELOPMENTAL DISABILITY	**PD/IB/GL NUMBER**	
No content		
CHAPTER 6 – EMERGENCY CARE	PD/IB/GL NUMBER	
Emergency Department Patients Awaiting Care	PD2018_010	6.1
Emergency Department - Notification of Specialist or VMO Regarding Patients Admitted Through the ED	GL2011_003	6.11
Triage in NSW Emergency Departments	PD2013_047	6.12
Emergency Department – Direct Admission to Inpatient Wards	PD2009_055	6.22
NSW Rural Adult Emergency Clinical Guidelines	GL2022_004	6.25
Responding to Sexual Assault (adult and child) Policy and Procedures	PD2020_006	6.26
Domestic Violence - Identifying and Responding	PD2006_084	6.28
Domestic Violence – Men's Behaviour Change Programs	IB2014_003	6.29
Domestic and Family Violence Migration Regulations: Relevance for Health Workers	IB2018_017	6.31
New South Wales Health Services Functional Area Supporting Plan (NSW HEALTHPLAN)	PD2014_012	6.33
Major Incident Medical Services Supporting Plan	GL2018_017	6.34
Mass Casualty Triage Pack – SMART Triage Pack	PD2017_037	6.36
Closed Head Injury in Adults – Initial Management	PD2012_013	6.43
NSW Paediatric Clinical Care and Inter-Hospital Transfer Arrangements	PD2023_019	6.47
Departure of Emergency Department Patients	PD2014_025	6.49
Critical Care Tertiary Referral Networks & Transfer of Care (Adults)	PD2018_011	6.58
Autonomic Dysreflexia (Revised) – Safety Notice 014/10	SN:014/10	6.88
Maternity –Resuscitation of the Newborn Infant	GL2018_016	6.92
Hospital Response to Pandemic Influenza Part 1: Emergency Department Response	PD2007_048	6.93
Public Health Real-Time Emergency Dept Surveillance System (PHREDSS) Public Health Unit Response	GL2010_009	6.111
Retrieval Handover (Adults)	PD2012_019	6.114

Emergency Department Short Stay Units	PD2014_040	6.116
Emergency Department, Nurse Delegated Emergency Care, Medication Standing Orders	PD2015_024	6.124
Safe Assessment Rooms	GL2020_001	6.149
Early Evidence Collection	GL2022_010	6.150
Managing non-fatal strangulation in the emergency department	IB2023_038	6.151
CHAPTER 7 – EYE CARE **NO CONTENT**	PD/IB/GL NUMBER	Page No
CHAPTER 8 – POLICY ON SMOKING IN THE WORKPLACE	PD/IB/GL NUMBER	
NSW Health Smoke_Free Health Care Policy	PD2015_003	8.1
Amendment to the NSW Health Smoke-Free Health Care Policy PD2015_003	IB2018_026	8.3
CHAPTER 9 – HEALTH RECORDS AND INFORMATION	PD/IB/GL NUMBER	Page No
Mental Health Clinical Documentation	PD2021_039	9.1
Privacy Management Plan	IB2023_012	9.3
Photo and video imaging in cases of suspected child sexual abuse, physical abuse and neglect	PD2015_047	9.5
Adoption Act 2000 – Release of Information	PD2016_036	9.34
Electronic Information Security	PD2020_046	9.41
Subpoenas	PD2019_001	9.53
Health Records and Medical/Clinical Reports – Charging Policy	PD2006_050	9.83
Health Records and Medical/Clinical Reports Rates	Refer to PDS for latest Information Bulletin	
Fees for Cremation Certificates Issued by Salaried Medical Practitioners of Public Hospitals	Refer to PDS for latest Information Bulletin	
Consent to Medical and Healthcare Treatment	IB2020_010	9.89
Adult-to-Adult Living Donor Liver Transplantation Guidelines	GL2008_019	9.89
Notification of Infectious Diseases Under the NSW Public Health Act 2010	IB2013_010	9.90
NSW Perinatal Data Collection (PDC) – Reporting and Submission Requirements from 1 January 2016	PD2015_025	9.91
NSW Register of Congenital Conditions – Reporting Requirements	PD2018_006	9.99
Notifying Cancer-Related Data to the NSW Cancer Registry	PD2022_008	9.102
Child Wellbeing and Child Protection Policies and Procedures for NSW Health	PD2013_007	9.112
General Retention and Disposal Authority: Patient Records (GDA17) and Administrative Records (GDA21)	IB2019_015	9.114
General Retention and Disposal Authority – Original or Source Records that have been Copied (GA 45)	IB2015_052	9.115
General Retention and Disposal Authority – Departments of Forensic Medicine (Public Health System) GDA 19	IB2004/44	9.116
Child Death Review Team – Access to Records	IB2014_028	9.117
Notifiable Conditions Data Security and Confidentiality	PD2012_047	9.119
Intellectual Property Arising from Health Research	PD2023_007	9.126
State Health Forms	PD2009_072	9.127
Aboriginal and Torres Strait Islander Origin – Recording of Information of Patients and Clients	PD2012_042	9.136
Health Care Records – Documentation and Management	PD2012_069	9.147
Notification of Acute Rheumatic Fever and Rheumatic Heart Disease	IB2015_057	9.162

Non-admitted patient data collection: classification and code standards for reporting services provided from 1 July 2016 in a WEBNAP extract format	IB2016_039	9.163
Non-Admitted Patient Data Collection Transition From WEBNAP To EDWARD Reporting	GL2015_012	9.165
Right to Access Medical Records by Legal Representatives – Mental Health Review Tribunal Hearings	IB2018_019	9.168
The Guardianship Application Process for Adult Inpatients of NSW Health Facilities	GL2017_013	9.171
The Guardianship Application Process for Adult Inpatients of NSW Health Facilities	IB2017_001	9.171
NSW Health Admission Policy	PD2017_015	9.172
NSW Health Privacy Internal Review Guidelines	GL2019_015	9.181
Use of Exchange of Information Part 13A Crimes (Domestic and Family Violence) Act 2007 Form	IB2016_056	9.182
Electronic Medical Records of Information Exchange to reduce Domestic and Family Violence Threat	IB2020_022	9.185
Lookback	PD2023_003	9.187
CHAPTER 10 - IMAGING	PD/IB/GL NUMBER	Page No
Work Health and Safety – Limiting Staff Exposure to Ionising Radiation	PD2019_044	10.1
CHAPTER 11 – INFECTIOUS DISEASES, IMMUNISATION AND RELATED MATTERS	PD/IB/GL NUMBER	Page No
Principles for the Management of Tuberculosis in NSW	PD2022_007	11.1
Tuberculosis – Minimising the Risk of Tuberculosis in Patients Starting Anti TNF Inhibitors	GL2008_007	11.2
Tuberculosis – Sputum Induction Guidelines	GL2009_006	11.3
Tuberculosis in Children and Adolescents	GL2005_060	11.3
Tuberculin Skin Testing	PD2009_005	11.6
Bacille Calmette-Guerin (BCG) Vaccination	GL2023_003	11.15
Tuberculosis Contact Investigations	GL2019_003	11.16
NSW Aboriginal Blood Borne Viruses and Sexually Transmissible Infections Framework 2016-2021	IB2016_020	11.17
Neonatal and Infant Hepatitis B Prevention and Vaccination Program	PD2023_032	11.18
Authorised Nurse Immunisers and Authorised Midwife Immunisers	PD2023_027	11.19
Statewide Standing Orders for the Supply or Administration of Medication for Public Health Response	PD2016_035	11.20
Influenza – NSW Health Influenza Pandemic Plan	PD2016_016	11.47
Infection Prevention and Control Policy in Healthcare Settings	PD2023_025	11.86
Community Sharps Disposal by Area Health Services	PD2008_004	11.87
Community Sharps Management	GL2017_023	11.89
NSW Needle and Syringe Program	GL2023_002	11.90
Management of people with HIV who risk infecting others	PD2019_004	11.91
Management of Health Care Workers Potentially Exposed to HIV, Hepatitis B and Hepatitis C	PD2017_010	11.104
Management of health care workers with a blood borne virus and those doing exposure prone procedures	PD2019_026	11.121
Occupational Assessment, Screening and Vaccination Against Specified Infectious Diseases	PD2023_022	11.137
Creutzfeld-Jakob Disease Related Information Sharing	PD2014_041	11.138
NSW Framework and Standard Operating Theatre Procedure for HIV Point of Care Testing	GL2019_010	11.143

Human Immunodeficiency Virus (HIV) – Management of Non-Occupational Exposure	PD2015_005	11.144
Tuberculosis Management of People Knowingly Placing Others at Risk of Infection	PD2015_012	11.149
Mass Vaccination Clinics During Influenza Pandemic	GL2018_008	11.156
NSW Contingency Plan for Viral Haemorrhagic Fevers	GL2016_002	11.157
Pandemic Preparedness and Response with Aboriginal Communities in NSW	GL2019_009	11.158
Management of people exposed to a contact order condition	PD2019_037	11.159
Surveillance & Response for Carbapenemase-Producing Enterobacterales (CPE) in NSW Health Facilities	GL2019_012	11.169
Triggers for Escalation Following Detection of Infection Outbreaks or Clusters	GL2019_013	11.170
Early Response to High Consequence Infectious Diseases	PD2023_008	11.171
NSW Infection Prevention and Control Response and Escalation Framework	IB2023_019	11.172
CHAPTER 12 – MEDICAL CARE	**PD/IB/GL NUMBER**	**Page No**
Incident Management	PD2020_047	12.1
Open Disclosure	PD2023_034	12.2
Safety Alert Broadcast System (SABS)	PD2013_009	12.3
Adult and Paediatric Hospital in the Home Guideline	GL2018_020	12.14
Animal Visits and Interventions in Public and Private health Services in NSW	GL2012_007	12.15
Elective Surgery Access	PD2022_001	12.16
Verification of Death and Medical Certificate of Cause of Death	PD2023_014	12.43
Will Making in Public Health facilities	GL2023_006	12.52
Advertising Legal Services	IB2015_066	12.54
Admission to Discharge Care Coordination	PD2022_012	12.55
Intravascular Access Devices (IVAD) - Infection Prevention & Control	PD2019_040	12.68
Patients with Inherited Bleeding Disorders in Hospitals without a Haemophilia Treatment Centre	PD2023_005	12.103
Victims Rights Act 1996	PD2005_287	12.105
Research Governance in NSW Public Health Organisations	GL2011_001	12.116
Pressure Injury Prevention and Management	PD2021_023	12.117
Care Type Policy for Acute, Sub-Acute and Non-Acute and Mental Health Admitted Patient Care	PD2016_039	12.129
Patient Safety & Clinical Quality Program	PD2005_608	12.148
Kidney Health Check: Promoting the Early Detection & Management of Chronic Kidney Disease	PD2010_023	12.164
End-of-Life Care and Decision-Making	GL2021_004	12.171
Responding to Needs of People with Disability during Hospitalisation	PD2017_001	12.172
Drug and Alcohol Clinical Supervision Guidelines	GL2006_009	12.193
Managing withdrawal from alcohol and other drugs	IB2022_041	12.235
Prevention of Venous Thromboembolism	PD2019_057	12.236
Term Changeover – Ensuring an Effective Handover of Patient Care	GL2008_015	12.251
Using Resuscitation Plans in End of Life Decisions	PD2014_030	12.251
Insertion and Management of Nasogastric and Orogastric Tubes in Adults	GL2023_001	12.267
Healthcare Rights	IB2023_032	12.269
Clinical Handover	PD2019_020	12.270
Palliative Care Strategic Framework 2010-2013	PD2010_003	12.276
Same Gender Accommodation	PD2022_042	12.277
Recognition and Management of Patients who are Deteriorating	PD2020_018	12.282
Inter-Facility Transfer Process for Adults Requiring Specialist Care	PD2011_031	12.308
Pathway for Acute Coronary Syndrome Assessment (PACSA)	IB2023_009	12.322

Aboriginal Ear Health Program Guidelines	GL2011_013	12.323
Nutrition Care	PD2017_041	12.324
NSW Aboriginal Health Plan 2013-2023	PD2012_066	12.341
NSW Health & Ageing and Disability and Home Care (ADHC) Joint Guideline	GL2013_001	12.342
Snakebite & Spiderbite Clinical Management Guidelines 2013 - Third Edition	GL2014_005	12.344
Insertion and Management of Urethral Catheters for Adult Patients	GL2021_015	12.345
ComPacks Program Guidelines	GL2016_023	12.345
Cardiac Monitoring of Adult Cardiac Patients in NSW Public Hospitals	IB2022_027	12.346
NSW Clinical Service Framework for Chronic Heart Failure 2016	GL2017_006	12.347
Growth Assessment in Children and Weight Status Assessment in Adults	GL2017_021	12.348
Youth Health and Wellbeing Assessment	GL2018_003	12.349
Establishing a Subcutaneous Immunoglobulin (SCIG) Hospital Program	GL2020_024	12.350
National Health and Medical Research Council's New National Guidelines for Drinking Alcohol	IB2021_001	12.352
Clinical principles for end of life and Palliative Care	GL2021_016	12.353
Domestic Violence Routine Screening	PD2023_009	12.354
CHAPTER 13 – MENTAL HEALTH	**PD/IB/GL NUMBER**	**Page No**
Seclusion and Restraint in NSW Health Settings	PD2020_004	13.1
Aggression, Seclusion & Restraint in Mental Health Facilities – Guideline Focused Upon Older People	GL2012_005	13.18
HEALTHPLAN – Mental Health Services Supporting Plan	GL2012_006	13.19
Clinical Care of people who may be suicidal	PD2022_043	13.20
Sexual Safety – Responsibilities and Minimum Requirements for Mental Health Services	PD2013_038	13.38
Sexual Safety of Mental Health Consumers Guidelines	GL2013_012	13.54
The NSW Aboriginal Mental Health and Wellbeing Strategy 2020-2025	IB2021_002	13.56
NSW Older People's Mental Health Services SERVICE PLAN 2017-2027	GL2017_022	13.57
Specialist Mental Health Services for Older People (SMHSOP) Community Model of Care Guideline	GL2017_003	13.57
Discharge Planning and Transfer of Care for Consumers of NSW Health Mental Health Services	PD2019_045	13.58
Drug and Alcohol Psychosocial Interventions Professional Practice Guidelines	GL2008_009	13.75
Mental Health Clinical Documentation Guidelines	GL2014_002	13.75
Physical Health Care within Mental Health Services	PD2017_033	13.76
Physical Health Care for People Living with Mental Health Issues	GL2021_006	13.82
SAFE START Strategic Policy	PD2010_016	13.83
SAFE START Guidelines: Improving Mental Health Outcomes for Parents & Infants	GL2010_004	13.84
School-Link Initiative Memorandum of Understanding	PD2010_020	13.85
Electroconvulsive Therapy (ECT) ECT Minimum Standard of Practice in NSW	PD2011_003	13.87
Accessing Inpatient Mental Health Care for Children and Adolescents	IB2023_001	13.88
Chief Psychiatrist Panel Review of Complex Mental Health Treatment Plans	PD2011_055	13.89
Monitoring Clozapine-induced Myocarditis	GL2022_011	13.93
Forensic Mental Health Services	PD2012_050	13.94
Mental Health Triage Policy	PD2012_053	13.95
Call Handling Guidelines for Mental Health Telephone Triage Services	GL2012_008	13.119
Psychiatric Emergency Care Centre Model of Care Guideline	GL2015_009	13.120
NSW SMHSOP Acute Inpatient Unit Model of Care Guideline	GL2016_016	13.121

Engagement and Observation in Mental Health Inpatient Units	PD2017_025	13.122
Adult Mental Health Intensive Care Networks	PD2019_024	13.131
Management of Patients with Acute Severe Behavioural Disturbance in Emergency Departments	GL2015_007	13.148
Supporting Young People During Transition to Adult Mental Health Services	GL2018_022	13.149
Use of Audio-Visual Link for Mental Health Assessments under the Mental Health Act 2007	GL2022_007	13.150
Forensic Patient Electronic Monitoring	GL2022_008	13.151
Domestic Violence Routine Screening	PD2023_009	13.152
CHAPTER 14 – MIGRANT HEALTH	PD/IB/GL NUMBER	Page No
Standard Procedures Working with Health Care Interpreters	PD2017_044	14.1
Domestic Violence and Migration Regulations: Relevance for Health Workers	IB2018_017	14.33
NSW Plan for Healthy Culturally and Linguistically Diverse Communities: 2019-2023	PD2019_018	14.35
CHAPTER 15 - NURSING	PD/IB/GL NUMBER	Page No
NSW Health Nurse Practitioners	PD2022_057	15.1
Nursing and Midwifery Management of Drug and Alcohol use in the Delivery of Health Care	PD2020_032	15.2
Nursing & Midwifery Clinical Guidelines – Identifying and Responding to Drug & Alcohol Issues	GL2008_001	15.2
Nurse administered Thrombolysis for ST Elevation Myocardial Infarction (STEMI)	PD2022_055	15.3
Nurse Delegated Emergency Care (NDEC) Nurse Management Guidelines (NMG)	GL2017_009	15.4
RN Supply and Administration of STI Therapies in Publicly Funded Sexual Health Services	PD2020_024	15.5
CHAPTER 16 – AGED CARE FACILITIES (NURSING HOMES)	PD/IB/GL NUMBER	Page No
Reporting for Residential Aged Care Services	PD2022_054	16.1
Wellness and Reablement in Aged Care	GL2021_002	16.3
CHAPTER 17 - OBSTETRICS	PD/IB/GL NUMBER	Page No
Public Homebirth Services in NSW	GL2020_022	17.1
Management of Threatened Preterm Labour	GL2022_006	17.2
Reporting of Maternal Deaths to the Clinical Excellence Commission	PD2021_006	17.3
Management and Investigation of a Stillbirth	PD2007_025	17.4
Maternity – Management of Pregnancy Beyond 41 Weeks Gestation	GL2014_015	17.17
Assisted Reproductive Technology - Ethical Guidelines	GL2006_011	17.18
Genetic Testing including DNA Diagnostic Testing, DNA Testing for Mutation Carriers and DNA Predictive and Presymptomatic Testing	PD2007_066	17.18
Prenatal Testing/Screening for Down Syndrome & Other Chromosomal Abnormalities	PD2007_067	17.35
Genetic Testing - Guidelines for Prioritising Genetic Tests	GL2007_013	17.53
DNA Testing - Predictive and Diagnostic for Serious Adult Onset Neurogenetic Disorders	PD2005_303	17.55
Maternity – Management of Hypertensive Disorders of Pregnancy	PD2011_064	17.64
Care Pathway for Women Concerned about Fetal Movements	GL2021_019	17.93
Rh (D) Immunoglobulin (Anti-D)	GL2015_011	17.94
Investigation, Review and Reporting of Perinatal Deaths	PD2022_046	17.95
Framework for Termination of Pregnancy in New South Wales	PD2021_018	17.102

Prevention of Termination of Pregnancy for the Sole Purpose of Sex Selection	GL2021_008	17.111
Maternity –Resuscitation of the Newborn Infant	GL2018_016	17.113
Postpartum Haemorrhage (PPH)	GL2021_017	17.114
Maternity – Timing of planned or pre-labour Caesarean Section at Term	GL2016_015	17.115
Maternity - Safety and Quality Essentials	PD2023_031	17.116
Maternity – Management of Early Pregnancy Complications	PD2012_022	17.118
Maternal & Child Health Primary Health Care Policy	PD2010_017	17.152

PATIENT MATTERS MANUAL

FOR

HEALTH SERVICE AREAS

June 1989

FOREWORD

This is one of a series of Public Hospital Procedure Manuals produced as a joint project by the Department of Health New South Wales and the Australian College of Health Service Administrators (NSW Branch).

Whilst the manual reflects the current Departmental policies contained in the Consolidated Circulars that it supersedes, it must be emphasised that it is a 'live' document to which amendments will be issued on a regular basis. Amendments should be recorded on the amendment sheet.

Suggestions are invited for amendments and should be submitted through the appropriate channels i.e. hospital administration, Area/District Offices.

TABLE OF CONTENTS

CHAPTER 1 - ANAESTHETICS	PD/IB/GL NUMBER
Principles of Anaesthetic Care	
Pre-Anaesthetic Consultation	
Administration of Drugs Specifically to Produce Coma	
Major Regional Anaesthesia	
Anaesthetic Machines	

1. ANAESTHETICS 1.1

PRINCIPLES OF ANAESTHETIC CARE

- Anaesthesia should be administered only by medical practitioners with appropriate training in anaesthesia.

- Every patient presenting for anaesthesia should have a pre-anaesthetic consultation by a medical practitioner.

- Modern practice demands certain basic facilities, equipment and staff for safe administration of anaesthesia.

- An operation involving a general anaesthetic is not to be undertaken unless the services are available of a second medical practitioner to act as anaesthetist.

(Faculty of Anaesthetists, Royal Australasian College of Surgeons Documents Nos. P2, P7, T1, T3, T4, T6.)

PRE-ANAESTHETIC CONSULTATION

- The pre-anaesthetic consultation will ensure that the patient is in the optimal state for anaesthesia and surgery. It should be performed by the anaesthetist who is to administer the anaesthetic.

- The pre-anaesthetic consultation should include:

  (a) Identification of the patient
  (b) Confirmation of the nature of the procedures
  (c) A medical history and clinical examination of the patient
  (d) Ordering appropriate pre-medical if necessary
  (e) A written summary, which is part of the medical record

(Faculty of Anaesthetists, Royal Australasian College of Surgeons, Document No. P7.)

ADMINISTRATION OF DRUGS SPECIFICALLY TO PRODUCE COMA

- Every patient who is to be given drugs for the specific purpose of producing coma should have a general medical assessment by a medical practitioner.

- Persons administering drugs which produce coma should have the basic knowledge to be able to:

  - understand and deal with the actions of the drug and a drug being administered;
  - defect and manage appropriately any complications arising from these actions;
  - anticipate and manage appropriately the modifications of these actions by any concurrent therapeutic regime or disease process which may be present.

- The administration of drugs for the specific purpose of producing coma should be directly supervised by a practitioner with appropriate postgraduate training in anaesthetics. This person must not assume the additional role of operator.

- Whenever drugs are used to produce coma, certain basic facilities, equipment and staff should be provided.

(Faculty of Anaesthetists, Royal Australasian College of Surgeons, Documents Nos. P5, P4, P8, T1.)

MAJOR REGIONAL ANAESTHESIA

- Major regional anaesthesia should be undertaken only by persons with adequate experience in the technique to be applied, and the ability to recognise and treat any complications arising from the anaesthetic technique, promptly and competently.

- Management of major regional anaesthesia should include appropriate monitoring and therapy by the anaesthetist, who should be present until the block is complete, the condition of the patient is stable, and any surgical procedure has been completed.

- The placement and subsequent management of an epidural cannula, including top-up doses, remains the responsibility of the anaesthetist inserting the cannula, no matter who performs these later procedures.

- Should the anaesthetist delegate the further management including topping up of the epidural cannula to another person it is the responsibility of the anaesthetist to properly hand over the patient's management to that person and to satisfy himself or herself of the competence of that person to manage the patient and carry out the top-up procedure. Adequate medical records documenting the time, due and subsequent effects must be kept.

- Competence should be established by:

  (a) a form of accreditation which certifies that the procedure has been carried out satisfactorily under supervision, and

  (b) inquiry of the person to establish familiarity with and knowledge of the procedure and subsequent management, including the management of complications.

- No person may be required to carry out the top-up procedure if he or she is uncertain of his or her competence to do so.

- Certain basic facilities, equipment and staff for the safe administration of anaesthesia should be provided.

- The anaesthetist must ensure that he or she is readily contactable, and suitable arrangements must be made for a competent medical officer to be available to see the patient at any time during major regional anaesthesia should the nursing staff consider this necessary.

(Faculty of Anaesthetists, Royal Australasian College of Surgeons Document Nos. P3, T1.)

ANAESTHETIC MACHINES

The Special Committee investigating deaths under anaesthesia received reports of fatalities attributed to accidental jamming of non re-breathing (Ruben type) valves in the inspiratory position. The patients were subjected to excessive intrapulmonary pressures as gases from the anaesthetic machine entering the system were unable to escape therefrom.

This accident is likely to arise in any non re-breathing valve which, like the Ruben, does not include a built-in pressure limiting safety device. Anaesthetists should be aware that any sudden, possibly unnoticed, variation in gas inflow or patient ventilatory pattern may so jam the valve that a disastrous pressure injury results. Examples of the way in which this may occur are:

(a) Major variations in patient minute volume.
(b) Coughing following a period of breath-holding.
(c) Accident operation of the emergency oxygen flow control.

Medical interference with the function of the valve spindle by drapes, when the operative field includes the head and neck area, is another possible cause.

Since no guarantee can be given that one or more of the above circumstances will not happen in any anaesthetic, the Special Committee considers that no system which includes a non re-breathing valve should be set up which does not contain a pressure-relief device, set to operate at a pressure below that which could cause damage to the patient's lungs.

It has been suggested that the simplest way of achieving this is to position a straight Heidbrink-type expiratory valve between the gas supply and the reservoir bag of the system. (If the hospital's machines do not incorporate an appropriate pressure relief device, steps should be taken to see that a Heidbrink-type expiratory valve as recommended is available for the use of anaesthetists.) This valve should be set to 'blow off' at pressure which can be achieved comfortably by a forcible expiration. A characteristic hiss of escaping gas will warn the anaesthetist that the non re-breathing valve has jammed, whilst at the same time ensuring that pressure in the system does not build up to dangerous levels.

Following the issue of Commission Notice 70/20 concerning modifications of Emergency Oxygen Valves to prevent inadvertent operation, several hospitals enquired whether this referred to the valve in the circle absorber or the valve on the frame of the machine. The valve for which modification is recommended is the one situated on the circle absorber (Boyle MK.111).

Hospitals are also reminded of the need for machines to be fitted with an oxygen low level alarm.

NEWBORN BLOODSPOT SCREENING POLICY (PD2016_015)

PD2016_015 rescinds PD2006_099.

PURPOSE

This Policy Directive provides direction to maternity services in NSW regarding the requirements of the Newborn Bloodspot Screening Program. This includes the following information: parents / guardians must be provided with information about conditions that are screened for by the Newborn Bloodspot Screening Program; the consent and documentation that must be obtained and recorded; and the requirements in relation to the privacy, storage and security of the information collected.

MANDATORY REQUIREMENTS

All parents / guardians must be provided with the consumer brochure *Newborn Bloodspot Screening* in the last four to six weeks of pregnancy.

All parents / guardians must be told about:

- What information is collected
- Storage of the blood sample
- The potential uses of the information collected
- The potential future uses of the blood sample
- The privacy and protection processes.

All parents / guardians must be provided an opportunity to ask questions about the Newborn Bloodspot Screening program.

All parents / guardians must sign the written consent component of the newborn screening card prior to the blood sample being collected.

All parents / guardians must be offered Newborn Bloodspot Screening for their baby within 48–72 hours of the baby's birth.

A newborn bloodspot screening card must be sent to the Newborn Bloodspot Screening laboratory for every baby born in NSW, even in the event that the parents/guardians have refused the screening test.

IMPLEMENTATION

The Chief Executives of NSW Local Health Districts are ultimately responsible for the implementation of this Policy Directive within their services / facilities.

1 BACKGROUND

1.1 Introduction

Newborn bloodspot screening (NBS) detects babies at risk of serious disorders including phenylketonuria, primary congenital hypothyroidism, cystic fibrosis, galactosaemia and rare metabolic disorders of amino acids, organic acids and fatty acid oxidation defects. Early diagnosis and treatment by medication or diet can prevent death or serious complications and can lead to significantly improved outcomes. Among the 100,000 babies born each year in NSW and ACT, over 100 babies are diagnosed with one of these conditions.

A checklist (Appendix 1) has been developed for health professionals to ensure that parents have been provided the information at the most appropriate time about the:

- Screening tests and benefits
- Storage and potential uses of bloodspots
- Consent processes
- Legally enforceable privacy safeguards.

1.2 Key definitions

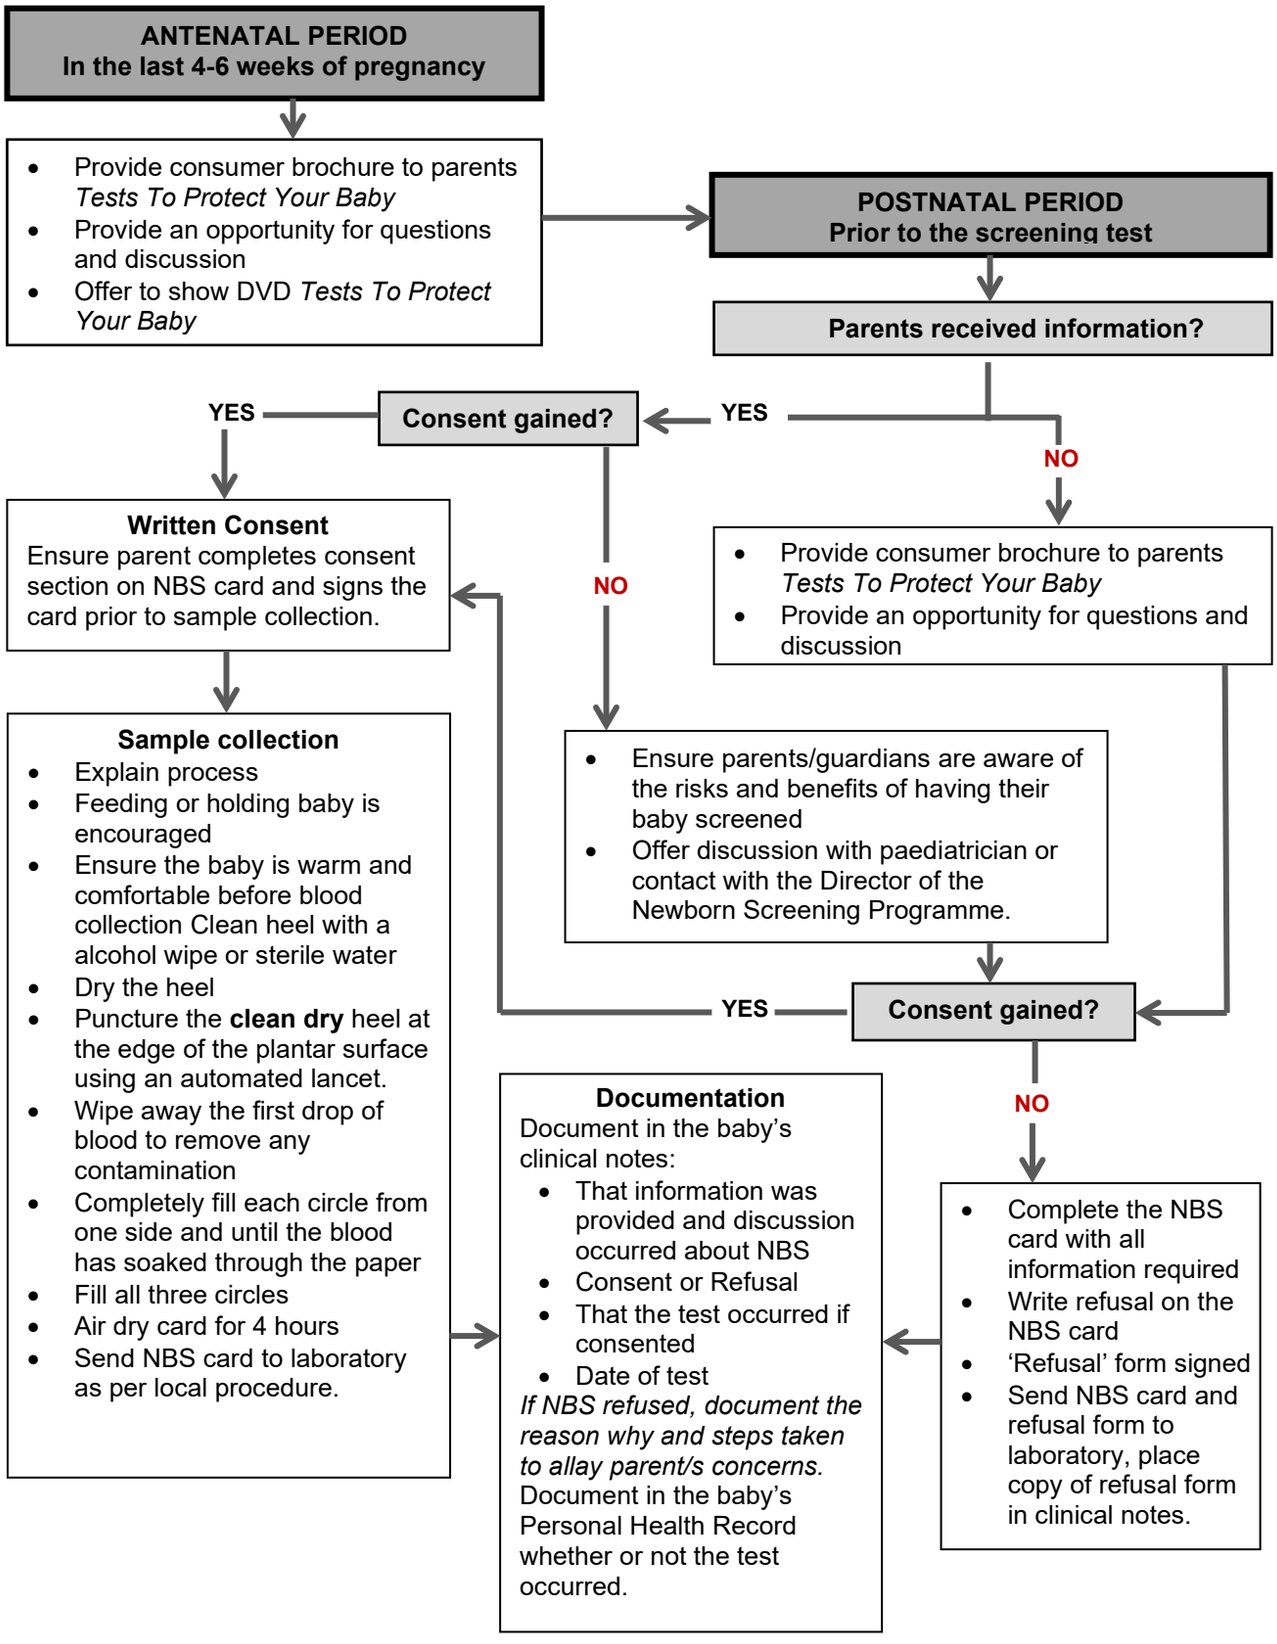
Must - Indicates a mandatory action requiring compliance.

Should - Indicates a recommended action that should be followed unless there are sound reasons for taking a different course of action.

1.3 Abbreviations

CF	Cystic Fibrosis
DNA	Deoxyribonucleic acid
LHD	Local Health District
MCAD	Medium chain acyl coenzyme A dehydrogenase
MOU	Memorandum of Understanding
NBS	Newborn Bloodspot Screening
PHO	Public Health Organisation
PKU	Phenylketonuria
PPM	Privately practising midwife

FLOWCHART: NEWBORN BLOODSPOT SCREENING PROCESS



2 INFORMATION FOR PARENTS / GUARDIANS

All information as outlined below must be provided to parents / guardians prior to the blood sample being collected.

- Parents / guardians:
  - Must be given a copy of the consumer brochure *Newborn Bloodspot Screening* in an appropriate language where possible
  - Should be offered the opportunity to watch the *NSW & ACT Newborn Screening Tests Education Video For Parents*
  - Must be told:
    - What information is collected Section 8.1
    - Storage of the blood sample Section 8.2
    - The potential uses of the health information collected Section 8.3
    - Potential future use of the blood sample Section 8.4
    - The privacy and protection processes Section 8.2
  - Must be provided with the opportunity to ask questions (discussion and questions may occur either in a group situation such as antenatal classes and / or on a one to one basis). An interpreter must be present for this discussion if required.

NOTE: The consumer brochure must not be distributed without discussion.

3 BLOODSPOT SCREENING

Newborn bloodspot screening is highly recommended for all babies. Among the 100,000 babies born each year in NSW and ACT, over 100 babies are diagnosed with one of the conditions tested for. Early diagnosis and immediate treatment by medication or diet can prevent death or serious complications including intellectual disability, and lead to significantly improved outcomes.

Therefore:

- Newborn bloodspot screening must be offered to all babies.
- Parents / guardians should be informed about newborn bloodspot screening during the last four to six weeks of their pregnancy to allow sufficient time for consideration, clarification and informed decision-making
- Prior to the blood sample being collected, the person taking the sample must:
  - Check that parents / guardians have received a copy of the consumer brochure *Newborn Bloodspot Screening*
  - That they have had opportunity for discussion and clarification
  - That they consent to the screening test
  - Cross check patient identification.

4 CONDITIONS SCREENED

The Newborn Bloodspot Screening program screens for approximately 25 medical conditions. Only a small number of babies will be diagnosed with one of the medical conditions of which the following are the more common conditions detected.

Table 2: Conditions screened for

Condition	Incidence	Caused by	If left untreated	Treatment
Primary congenital hypothyroidism:	1 in 2,600 live births (about 40 babies per year).	Absence or abnormal formation or function of the thyroid gland.	Causes growth and intellectual disability if not treated.	Medication with thyroid hormone started early results in normal growth and development.
Cystic Fibrosis (CF):	1 in 3,700 live births (about 30 babies per year).	A dysfunctional gene results in thick mucus in different organs throughout the body in particular the lungs and gastrointestinal tract.	Without treatment severe chest infections occur and often very serious failure to thrive leading to early death.	Early commencement of treatment greatly improves the health of individuals with CF.
	NOTE: Newborn bloodspot screening detects about 95% of babies with CF. Screening will also detect some babies who may only be healthy carriers. For these babies a sweat test at about six weeks of age determines whether the baby has CF or is a healthy carrier.			
Phenylketonuria (PKU):	1 in 10,000 live births (about 10 babies per year).	Inability of the body to break down the essential amino acid phenylalanine.	High blood levels of phenylalanine cause severe intellectual disability if left untreated.	A carefully managed diet low in phenylalanine, started in the first two to three weeks prevents this damage.
Medium chain acyl coenzyme A dehydrogenase (MCAD) deficiency:	1 in 15,000 births (about 6-8 babies a year).	Inability of the body to completely break down fat.	May be life-threatening or cause severe disability during times of common childhood illnesses.	Extra precautions are taken to ensure adequate energy intake during illnesses.
Galactosaemia:	1 in 40,000 births (about 1-3 babies per year).	Inability of the body to process galactose, a component of lactose found in milk and other foods.	Life-threatening liver failure and infections can occur.	A galactose-free diet commenced before 2 weeks of age is lifesaving.
Other rare metabolic disorders:	Rarer disorders that in total affect approximately 20 babies a year.	Some disorders of the metabolism of amino acids, urea cycle, organic acids and fatty acid oxidation can be detected.	Without appropriate management they can have severe disability or death.	Early detection is important as diet and medications can treat most of these disorders.
NOTE: For further information on disorders screened for please see: http://www.schn.health.nsw.gov.au/health-professionals/statewide-laboratory-services/nsw-newborn-screening-programme				

5 OBTAINING AND RECORDING OF CONSENT OR REFUSAL

5.1 Consent

Offering the screening test and obtaining consent should comply with PD2005_406 Consent to Medical Treatment – Patient Information. As the baby is a patient under the age of 14 the consent of a parent or guardian is necessary.

The following are the levels of consent required by NSW Health for the Newborn Bloodspot Screen.

Table 3: Consent

Procedure	Level of consent and documentation
Obtaining newborn blood sample for screening	Verbal consent required and to be documented in the baby's clinical notes. Written consent by parent / guardian is documented on the NBS card at the time of taking the sample.
Storage of the sample for longer than 2 years	Written consent by parent / guardian is documented on the NBS card at the time of taking the sample.
Use of the sample for de-identified research	Parent / guardian indicates yes / no on NBS card at the time of taking the sample. NOTE: *Cards without consent for de-identified research will not be used for de-identified research.*
Use of the sample for identified research	Written consent from either the parent or the child (dependent on the age of the child at the time of the research) will be required prior to the research being commenced.

5.2 Processes for obtaining consent to newborn bloodspot screening

In newborn bloodspot screening, valid consent requires provision of full information about the test including information about what happens to the bloodspot sample after testing as outlined in Section 7. Any NSW Public Health Organisation (PHO) caring for babies must ensure the following:

- Both sections on the newborn bloodspot screening card *Consent for the collection and testing of sample* and *Storage >2 years* must be completed by the parent/guardian
- The newborn bloodspot screening card must be signed by the parent /guardian
- Documentation in the baby's clinical record includes the following:
  - That discussion about the newborn bloodspot screening test has occurred
  - That the parent / guardian has consented
  - That the newborn screening test has occurred. Use of a pre-inked stamp similar to the example below is recommended.
- Documentation in the baby's Personal Health Record (PHR) "Blue Book" whether or not the newborn bloodspot screen occurred.

Baby's name: _____

Signature (Health Professional)

Provision of the NBS pamphlet: _____ Date: _____

Discussion of NBS information: _____ Date: _____

Verbal/written consent: _____ Date: _____

Completion of sample collection: _____ Date: _____

5.3 Refusals

Parents / guardians may refuse the newborn bloodspot screening test on behalf of the baby. In this circumstance, it is suggested that parents/guardians:

- Are provided an opportunity to discuss their concerns with a paediatrician or specified health professional who is aware of all the implications of not screening
- Are offered the option of telephoning the Director of the Newborn Screening Programme to answer any further questions they may have Telephone (02) 9845 3659
- Are advised to notify their health care worker, in the event of the child requiring medical attention, that the child has not been screened.

Clinicians should undertake the following:

- Document the reason for refusal in the baby's medical record
- Complete a newborn bloodspot screening sample card, with all information completed on both sides, and write "refusal" on the card
- Send the card and the completed refusal form to the laboratory
- Retain a copy of the refusal form in the baby's clinical notes.

NOTE: PD2005_406 Consent to Medical Treatment – Patient Information provides guidance concerning refusals and care and protection of minors based on the Children and Young Persons (Care and Protection) Act 19981.

NOTE: A refusal form is available for use by hospitals in the NSW Newborn Screening Programme Sampling Information and Guidelines (see Section 9).

6 COLLECTING THE BLOODSPOT SAMPLE

- The process for collecting the bloodspot must be explained to parents
- A blood sample is obtained by heel prick ideally when the baby is 48 to 72 hours old
- The blood sample is placed on a special pre-printed filter paper card
  - Do not use the card if damaged
  - Do not touch the sample area.
- The heel is the preferred site to obtain the sample. In the event that a sample cannot be obtained at the heel and a venepuncture is being undertaken for other tests, this blood can be used for Newborn Bloodspot Screening. In this case clinicians should ensure that the blood obtained is not mixed with other solutions or taken from a tube containing preservative prior to placing the sample on the card. Any blood sample obtained should be placed directly onto the card before being used for other testing purposes
- Mothers / parents / guardians are encouraged to be present and hold the baby during the procedure
- To relieve discomfort for the baby, breast-feeding is encouraged or alternatively comfort measures should be provided
- Should an adverse reaction or injury occur when obtaining the blood sample, a notification should be made through the NSW Health Incident Information Management System (IIMS).

1 NSW Children and Young Persons (Care and Protection) Act, 1998

Table 4: Sample collection	
Step	**Action**
1	Ensure the baby is warm and comfortable before blood collection
2	Puncture the clean **dry** heel at the edge of the plantar surface using an automated disposable lancet (Point < 2mm)
3	Wipe away first drop of blood
4	Completely fill each circle from one side and until the blood has soaked through the paper Do NOT layer blood
5	Allow spots to dry before mailing (4 hours)
6	Return completed card **without delay** To: NSW Newborn Screening Programme Locked Bag 2012, WENTWORTHVILLE NSW 2145

6.1 Discharge prior to 48 hours of age

Arrangements must be made for the blood sample to be collected between 48 and 72 hours for all babies discharged prior to 48 hours of age.

The bloodspot sample should only be collected prior to 48 hours of age if:

- The baby is being discharged prior to 48 hours of age, and
- Availability for sample collection post discharge is compromised.

7 RESULTS

The receipt of each baby's bloodspot card is confirmed with the hospital of birth. Results are usually available within two working days after receipt of the sample. In most cases the results are normal and no further notification is made. Hospitals are only advised of individual results when retesting is necessary.

7.1 Repeat blood test

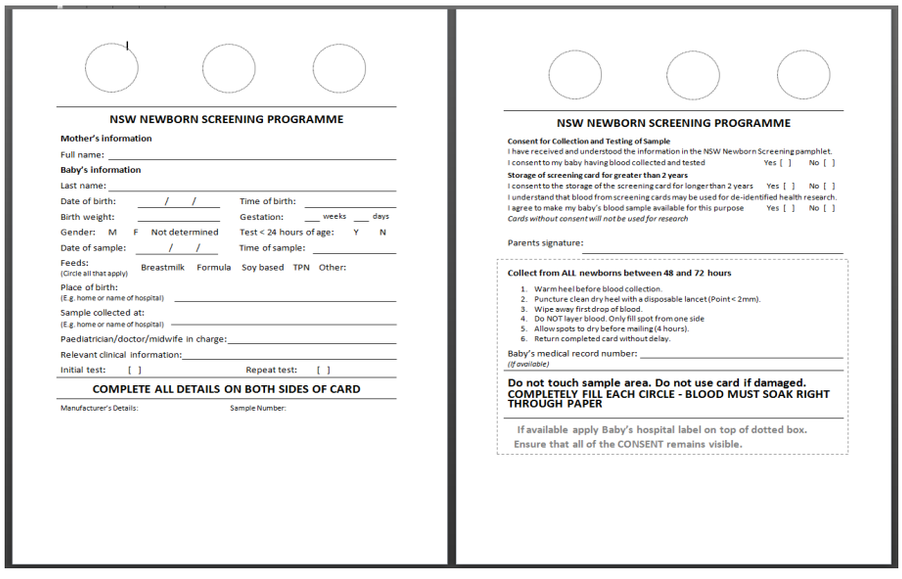
A few babies will need to have a second blood test usually because the first test did not give a clear result or the sample was unsuitable for testing. The reason for retesting should be explained to parents / guardians and most second tests will give normal results.

Routine repeat tests are required for babies with special circumstances such as those with very low birth weight and those who have received blood products as specified in the NSW and ACT Newborn Screening Programme: Sampling Information and Guideline (section 10).

7.2 Abnormal results

The paediatrician / doctor / privately practising midwife (PPM) identified on the newborn bloodspot screening card is notified of test results which are abnormal, the disorder being considered and any appropriate further samples required. It is the responsibility of this person to ensure that the baby is promptly referred for further investigation and treatment. The name of the person responsible must be filled in on the test card. Where there is uncertainty regarding whose name is to be written, it is recommended that the name be that of the paediatrician of the day.

8 NEWBORN BLOODSPOT SCREENING CARD



NSW NEWBORN SCREENING PROGRAMME

Mother's information

Full name: _____

Baby's information

Last name: _____

Date of birth: ___/___/___ Time of birth: _____

Birth weight: _____ Gestation: ___ weeks ___ days

Gender: M F Not determined Test < 24 hours of age: Y N

Date of sample: ___/___/___ Time of sample: _____

Feeds: (Circle all that apply) Breastmilk Formula Soy based TPN Other:

Place of birth: (E.g. home or name of hospital) _____

Sample collected at: (E.g. home or name of hospital) _____

Paediatrician/doctor/midwife in charge: _____

Relevant clinical information: _____

Initial test: [ ] Repeat test: [ ]

Manufacturer's Details: Sample Number:

NSW NEWBORN SCREENING PROGRAMME

Consent for Collection and Testing of Sample

I have received and understood the information in the NSW Newborn Screening pamphlet.

I consent to my baby having blood collected and tested Yes [ ] No [ ]

Storage of screening card for greater than 2 years

I consent to the storage of the screening card for longer than 2 years Yes [ ] No [ ]

I understand that blood from screening cards may be used for de-identified health research.

I agree to make my baby's blood sample available for this purpose Yes [ ] No [ ]

Cards without consent will not be used for research

Parents signature: _____

Collect from ALL newborns between 48 and 72 hours

1. Warm heel before blood collection.
2. Puncture clean dry heel with a disposable lancet (Point < 2mm).
3. Wipe away first drop of blood.
4. Do NOT layer blood. Only fill spot from one side
5. Allow spots to dry before mailing (4 hours).
6. Return completed card without delay.

Baby's medical record number: _____ *(If available)*

Do not touch sample area. Do not use card if damaged.
COMPLETELY FILL EACH CIRCLE - BLOOD MUST SOAK RIGHT THROUGH PAPER

If available apply Baby's hospital label on top of dotted box.
Ensure that all of the CONSENT remains visible.

Newborn bloodspot screening cards are provided by the NSW Newborn Screening Programme, and used in accordance with the NSW Newborn Screening Programme Sampling Information and Guidelines. Contact details are provided in Section 9.

8.1 Information collection and process

The newborn bloodspot screening card collects written information and three bloodspots.
ALL INFORMATION must be completed on the card as each field has been included for a specific purpose.
Once the heel prick process has occurred the newborn bloodspot screening card is sent to the laboratory at the NSW Newborn Screening Programme at The Children's Hospital at Westmead. The laboratory:

- Transfers the written information to an electronic record
- Tests the blood
- Retains the card containing the unused portion of the three bloodspots for a minimum of two years.

NOTE: All results are recorded in the electronic record, not on the card.

8.2 Privacy, storage, security and retention periods

8.2.1 Privacy, storage and security

The NSW Newborn Screening Programme as a NSW Health facility, is the custodian of the bloodspot cards and records. Both the electronic record and the bloodspot card are subject to the privacy protection requirements of NSW privacy legislation[2,3,4]. The bloodspot cards are stored in a secured locked area with appropriate safeguards to prevent unauthorised use, disclosure, loss or other misuse.

2 NSW Health Privacy Manual for Health Information as at March 2015: http://www.health.nsw.gov.au/policies/manuals/Documents/privacy-manual-for-health-information.pdf

3 Privacy and Personal Information Protection Act, 1998

4 Health Records and Information Privacy Act, 2002

8.2.2 Retention of cards and data

Cards

- In accordance with National Pathology Accreditation Advisory Council requirements the laboratory must retain the cards for a minimum of 2 years for quality assurance and audit purposes
- In general the cards are retained for 18 years (age a child can legally consent for themselves)
- After this time the cards are destroyed.

Data

- In accordance with National Pathology Accreditation Advisory Council requirements the data is stored for 100 years.

8.2.3 Deoxyribonucleic acid (DNA) testing and data

Newborn bloodspot screening involves biochemical testing. Approximately 1% of the samples show an increased risk for cystic fibrosis and MCAD deficiency (a fatty acid oxidation disorder) from the biochemical testing. As part of routine testing these samples are then retested for the most common mutations in the DNA associated with each disorder. No DNA tests are done on any other samples and no other DNA records are held.

8.3 Potential uses of bloodspots

Stored bloodspots have a number of potential uses (Table 5). Any further use must be in compliance with privacy law, NSW Human Tissue Act5 and the NSW Human Tissue Legislation Amendment Act 20126. Potential benefits from stored bloodspots include obtaining clinical information for the child and/or the family. Whilst requests for use for this purpose are rare, the information potentially available to families is extremely valuable. Bloodspots may also be used for research to improve newborn screening techniques or develop new tests. Individual consent will be sought before research on any identified sample. However, de-identified samples may be used for ethics committee approved research with the approval of the NSW Newborn Screening Advisory Committee.

8.3.1 Table 5: Potential uses of bloodspot samples

Table 5: Potential uses of bloodspot samples

Consent given on the card covers the following:	**SEPARATE consent other than on the card is required for the following:**
Directly related clinical purposes • Retesting to confirm result • Provide information to a person or organisation providing ongoing care to the baby.	***Clinical use for the individual and family*** • Further testing at the request of the parents or guardians that may provide medical information for the benefit of the child or family e.g. was an infection present at birth such as cytomegalovirus • Diagnostic information for future reproductive decisions.
Research using non-identifiable bloodspot samples • Samples may be released only with approval by the appropriate health research ethics committee and the NSW Newborn Screening Advisory Committee	***Research using identified bloodspot samples*** • Research requires approval from the parent/guardian, the appropriate health research ethics committee and the NSW Newborn Screening Advisory Committee.

5 NSW Human Tissue Act, 1983
6 NSW Human Tissue Amendment Act, 2012

Table 5: Potential uses of bloodspot samples	
Consent given on the card covers the following:	**SEPARATE consent other than on the card is required for the following:**
Laboratory quality control	***Third party access*** • Access to stored samples or information by employers, insurers, police, legal representatives, other relatives or medical practitioners requires written consent of the parent/guardian (or child if of age of consent) or by court order.
Patient access • Parents/guardians on behalf of the child or the patient at adulthood have the right to access personal information held about them	***Coronial purposes*** • A memorandum of understanding (MOU) between NSW Health and NSW police 2002[14] sets out parameters and processes for requests for access to newborn bloodspot screening cards.
	Access for law enforcement purposes and access and disclosure authorised by law • It is possible that access to samples and disclosure of information may be required by court order.

8.4 Transfer of cards to parents / guardians

The laboratory must retain the bloodspot cards for a minimum of 2 years for quality assurance and audit purposes in accordance with National Pathology Accreditation Advisory Council requirements. Any requests from parents/guardians for the destruction or transfer of the screening cards must be made in writing and must be supported with identification.
NOTE: Destruction or transfer of a screening card can only occur after the 2 year retention period is complete.
NOTE: For further information on sample storage and laboratory practice, please see:
http://www.schn.health.nsw.gov.au/health-professionals/statewide-laboratory-services/nsw-newborn-screening-programme

9 SAMPLING INFORMATION AND GUIDELINES

The NSW and ACT Newborn Screening Programme provide a guideline: *Sampling Information and Guidelines* which details procedures for:

- Storage of blank NBS cards
- Refusal of screening tests
- Collection of the blood sample for NBS
- Drying and storage of NBS cards prior to sending to laboratory
  - Hospital
  - Community
- Sending of NBS cards to laboratory
- When to take the sample if the baby needs a blood transfusion
- Low birth weight babies
- Stillbirths and neonatal deaths.

These are updated as required to incorporate new information and procedures and are supplied to hospitals / maternity units and privately practising midwives.
The Guideline is available either online at
http://www.schn.health.nsw.gov.au/files/attachments/newborn_screening_guidlines_2015.pdf or from: The NSW Newborn Screening Programme
Locked Bag 2012, WENTWORTHVILLE NSW 2145
Telephone: (02) 9845 3255 / 3659, Facsimile: (02) 9845 3800,Email: newborns@chw.edu.au

10 QUALITY ASSURANCE AND MONITORING

10.1 Role of the hospital/Local Health District (LHD)

The hospital of birth is responsible for ensuring all babies are offered the newborn screening test and arranging for any repeat samples, including those babies who have been transferred to another hospital and require a repeat sample.

Hospitals with maternity units and those who care for babies must nominate a liaison person (e.g. community liaison midwife or midwifery unit manager) to be responsible for newborn bloodspot screening. The name and position of the nominated (and relief person) should be notified in writing to *The NSW Newborn Screening Programme* (see Section 9). Responsibilities of the nominated newborn screening liaison person are detailed in The NSW and ACT Newborn Screening Programme Sampling Information and Guidelines and include the following:

- Ensuring that all parents / guardians are provided information on newborn bloodspot
- Ensuring that all babies have newborn bloodspot screening cards sent to the laboratory irrespective of whether the sample has been collected (Section 5.3)
- Ensuring that when a repeat or extra sample is requested by the laboratory that it happens in a timely manner
- Ensuring that staff are kept up to date with changes to the NSW Newborn Screening Programme Sampling Information and Guidelines.

Reports from the NSW Newborn Screening Programme are regularly provided to hospitals regarding screening samples and quality issues related to screening activities. LHDs are encouraged to ensure these reports are monitored locally to identify trends in relation to quality and compliance with this policy. Timely action must be taken when issues are identified that may adversely affect the efficacy of the screening test.

The Implementation Checklist for LHDs in relation to Newborn Bloodspot Screening is at Section 15

11 CONSUMER INFORMATION

Newborn Bloodspot Screening Consumer Brochure

A printable version of the consumer brochure *Newborn Bloodspot Screening* is provided at Attachment 1.For information on ordering hard copies of the consumer brochure (English only) please visit http://www.kidsfamilies.health.nsw.gov.au/publications/

The consumer brochure can also be downloaded from the Office of Kids and Families website http://www.kidsfamilies.health.nsw.gov.au/publications/tests-to-protect-your-baby-newborn-bloodspot-screening/

The consumer brochure is also available for download in Arabic, Traditional Chinese, Indonesian, Japanese, Khmer, Korean, Serbian, Turkish and Vietnamese, Thai, Bengali, Nepali, Tamil and Hindi at http://www.kidsfamilies.health.nsw.gov.au/publications/tests-to-protect-your-baby-newborn-bloodspot-screening/

NSW & ACT Newborn Screening Tests Education Video for Parents
Available to view online at http://www.schn.health.nsw.gov.au/health-professionals/statewide-laboratory-services/nsw-newborn-screening-programme

12 APPENDIX 1: CHECKLIST FOR HEALTH PROFESSIONALS

Table 3 Checklist for health professionals

During pregnancy	Provide the consumer brochure *Newborn Bloodspot Screening* to parents preferably in the last four to six weeks of pregnancy. Provide an opportunity for discussion and questions and offer to show the DVD *NSW & ACT Newborn Screening Tests Education Video for Parents*.
After birth	Make sure that parents / guardians have been provided the consumer brochure *Tests to protect your baby.* Make sure that parents/guardians have been provided with an opportunity for discussion and questions.
Inform parents/ guardians about:	1. Conditions tested – phenylketonuria, galactosaemia, hypothyroidism, cystic fibrosis and rare metabolic disorders. 2. Benefits of testing - diagnosis and treatment can prevent death or serious disability. 3. Collection of blood sample – encourage mothers to be present and breastfeed or offer alternative comfort measures. 4. Information collected – name, date of birth, hospital, etc. 5. Bloodspot storage - minimum of 2 years and in general are stored for up to 18 years – written consent on the back of the card. 6. Bloodspots and record security – governed by privacy and human tissue legislation and Health Department policy. 7. Potential uses of, access to, and storage of bloodspot cards: • Identified cards may be used for family benefit or research and only with separate consent obtained before testing • Non-identifiable cards, i.e. with identifiers permanently removed may be used for research approved by a health research ethics committee and with the approval of the NSW Newborn Screening Advisory Committee – consent on the back of the card • Parents have a right to access their child's information. Other access requires parental consent except where there is a court order. 8. Inform the parents about how results are conveyed • Normal results • Retesting • Abnormal results.
After all the above information has been provided and discussed:	1. Record in the mother's / baby's medical record that information has been provided and discussed. 2. Obtain and document parent / guardian consent in the baby's clinical record. 3. Hospital staff are required to complete the relevant section of the baby's Personal Health Record (Blue Book). 4. If parents refuse testing, see Section 5.3 of this Policy for further guidance 5. Conduct the test following sampling guidelines provided by the NSW Newborn Screening Programme.

BREASTFEEDING IN NSW: PROMOTION PROTECTION AND SUPPORT
(PD2018_034)

PD2018_034 rescinds PD2011_042.

PURPOSE

The policy supports NSW Health's commitment to best practice in the promotion, protection and support of breastfeeding; to increase the initiation and duration rates of breastfeeding and to ensure the Health workforce have the knowledge and skills to implement this policy.

MANDATORY REQUIREMENTS

NSW Health organisations must implement the strategies, appropriate to their organisation, identified in Section 4, The Practice Guide.

NSW Health organisations are required to comply with responsibilities under the WHO International Code of Marketing of Breastmilk Substitutes and the Marketing in Australia of Infant Formula: Manufacturers and Importers Agreement (MAIF).

NSW Health organisations must ensure midwives, child and family health and paediatric nurses complete the HETI eLearning module Breastfeeding Promotion, Protection and Support (course code 45338916) at commencement of employment and every 5 years.
The module is highly recommended, based on location and role, for Registered Nurses (RN) (Community Health), RN Mental Health and other RNs, Enrolled Nurses and Aboriginal and Torres Strait Islander Health Workers in contact with breastfeeding mothers.

IMPLEMENTATION

The Chief Executives or delegated officers of all NSW Health organisations must ensure the following actions are undertaken to implement the revised Policy Directive:

- All staff are made aware of the revised Policy Directive.
- Key personnel are made aware of their responsibilities in the revised Policy Directive.
- Designated lead is identified to develop local policies/guidelines/procedures to support the implementation of the revised Policy Directive.

Breastfeeding in NSW: Promotion Protection and Support Procedures

1 BACKGROUND

1.1 Introduction

NSW Health recognises and supports the importance of creating and providing environments in its services and facilities, where breastfeeding is promoted, protected and supported by all staff.

This Policy Directive, Breastfeeding in NSW – Promotion, Protection and Support (policy) supports and encourages breastfeeding as the optimal way for a woman to feed her infant. The policy also recognises that all women and their families have the right to clear, impartial and evidence based information to enable them to make an informed choice as to how they feed and care for their infants.

The policy is designed to contribute to the following goals:

- increase the number of infants exclusively fed with breast milk on discharge from the birth admission
- increase the number of infants exclusively fed with breast milk to around six months of age
- increase the number of infants continued to be fed with breast milk, to 12 months and beyond, after the introduction of family foods at around six months of age.

1.2 Key definitions

Health workforce	Refers to medical officers, nurses, midwives, Aboriginal health workers, allied health workers caring for pregnant and breastfeeding women, their families and infants
Maternity continuum	Refers to the antenatal, intrapartum and postnatal periods
NSW Health organisations	Refers to districts, networks, services, pillars, facilities, hospitals, community based health services
Women and their families	Refers to pregnant women, mothers, fathers, partners, family and is inclusive of the LGBTIQ community

See glossary for further definitions.

2 THE EVIDENCE

Breastfeeding is important for optimal infant nutrition, growth and healthy development, protection against infection and chronic disease, and benefits the mother's health. Breastfeeding provides short-term and long-term health, economic and environmental advantages to children, women, families and society.

The provision of evidence based quality care is integral to promoting, protecting and supporting breastfeeding in all NSW Health facilities and services. A literature review was conducted to inform the revision of the policy. For evidence from the recent literature review see Attachment 2.

3 THE POLICY CONTEXT

This policy has been reviewed within the context of the following state, national and international policies, frameworks, and services. The most relevant are listed below with a more extensive list at Attachment 3.

NSW State Health Plan Towards 2021

This plan provides the strategic framework for NSW Health and sets priorities across the system for the delivery of 'the right care, in the right place, at the right time' for everyone. Direction One: Keeping People Healthy supports a healthy start to life through breastfeeding, good nutrition and a healthy weight gain in pregnancy. This direction is also in line with one of the 12 Premier's priorities, reduce overweight and obesity rates of children by 5% over 10 years.

Healthy, Safe and Well a Strategic Health Plan for Children, Young People and Families 2014-2024 NSW Kids and Families

Healthy, Safe and Well is a 10-year strategic health plan focusing on preconception to 24 years of age. This plan's agenda is to renew efforts to promote health, prevent illness, embed early intervention and deliver integrated, connected care for all NSW children and families no matter where they live. The promotion of breastfeeding, in accordance with World Health Organisation (WHO) Standards and the Baby Friendly Health Initiative (BFHI), is a strategy under the plan.

NSW Healthy Eating Active Living Strategy

This strategy provides a whole of government framework to promote and support healthy eating and active living in NSW and to reduce the impact of lifestyle-related chronic disease. This strategy aims to ensure that everyone has opportunities to be healthy through the delivery of evidence-based, interactive and relevant programs. One of the strategy's actions is to promote the initiation and duration of breastfeeding as a way to provide good infant nutrition and reduce the risk of overweight and obesity in childhood, adolescence and early adulthood.

Australian National Breastfeeding Strategy

The Australian Government and jurisdictions are developing an enduring national breastfeeding strategy to replace the 2010-2015 strategy. This strategy encourages all public and private health

facilities/services to implement the BFHI steps to successful breastfeeding and to work towards or maintain BFHI accreditation. This policy will be reviewed, if required, once the national strategy has been released.

Australian Dietary Guidelines

The early nutrition and growth of infants has an important effect on early morbidity and mortality. There is increasing evidence of the medium and long-term effects of nutrition on health. Infant growth is now recognised as one of the influences on health and longevity of life and breastfeeding is the foundation of early nutrition. NSW Health supports the use of the National Health and Medical Research Council Australian Dietary Guidelines (2013) and the Infant Feeding Guidelines (2012).

WHO 2006 growth charts

In 2012, all Australian states and territories agreed to adopt the WHO 2006 growth charts as the standard for Australian children aged 0–2 years. The WHO 2006 charts reflect growth patterns among children who are predominantly breastfed for at least 4 months and are still breastfeeding at 12 months.

Baby Friendly Health Initiative

The role of the BFHI is to protect, promote and support breastfeeding by providing frameworks for:

- maternity services - Ten Steps to Successful Breastfeeding (Attachment 4)
- community facilities - 7 Point Plan (Attachment 5)
- neonatal services - The Neo-BFHI: The Baby-friendly Hospital Initiative (Attachment 6).

These three frameworks promote the importance of all women and families receiving appropriate support and consistent up-to-date information about infant feeding. While breastfeeding is promoted, every woman and family is supported to care for their infant in the best and safest way possible regardless of feeding choices and circumstances.

4 THE PRACTICE GUIDE

There has been significant work by health professionals and service managers to promote, protect and support breastfeeding in NSW. While Australia has a high rate of breastfeeding initiation, in NSW there is considerable scope to increase the rates of initiation, full breastfeeding on discharge from birth admission and breastfeeding duration.

Breastfeeding initiation and duration are influenced by many factors. For this reason a multifaceted approach targeting change at an organisation, service delivery, community and individual level is recommended.

Implementing the following strategies will assist NSW Health organisations to increase the rates of initiation and duration of breastfeeding:

i. Support infants being fed with breast milk
ii. Provide additional support to Aboriginal women, their partners, families and communities
iii. Provide additional support to women, their partners and families at risk of lower rates of breastfeeding initiation and duration
iv. Strengthen continuity of care, referral pathways and support networks
v. Support health professionals' education and professional development
vi. Provide breastfeeding friendly environments
vii. Ensure monitoring and surveillance
viii. Support Australia's response to the Marketing in Australia of Infant Formulas: Manufacturers and Importers Agreement 1992.

i. Support infants being fed with breast milk

Best Practice

NSW Health organisations providing maternity, neonatal and community child and family health services use the relevant BFHI frameworks to improve breastfeeding practices.

All women and their families receive consistent, evidence based information, education and support during the maternity continuum and early childhood periods regarding infant feeding.
NSW Health staff inform women and their families of accessible breastfeeding information, support and advice from evidence based sources such as the Australian Breastfeeding Association, Pregnancy Birth and Baby Helpline, or the Raising Children Network.
NSW Health organisations ensure all breastfed infants in their care receive breast milk from their birth mother except where there is access to a milk bank approved by the Chief Executive. Local arrangements should be made for special circumstances, including but not limited to, adoption, same sex couples, foster carers and surrogacy.
NSW Health organisations ensure that infants are not separated from their mothers for any length of time, unless clinically indicated, to support bonding and successful breastfeeding.
NSW Health organisations support women to continue breastfeeding when they or their infant are admitted, or present to, inpatient, emergency, outpatients or paediatric services.
Breastfeeding should be encouraged, welcomed and supported in all NSW Health organisations. It is important that there is a designated space with appropriate signage and facilities available for staff or visitors who need to breastfeed.
NSW Health organisations, caring for women and their families, implement/maintain or link with a breastfeeding reference group to facilitate policy implementation to protect, promote and support breastfeeding.
NSW Health organisations implement and evaluate evidence-based interventions that promote and support breastfeeding.

Health professionals should support women and their families to recognise the importance of breastfeeding for the health and wellbeing of their infants. NSW Health professionals are to fully support women and their families in their choice of infant feeding.

Evidence demonstrates that compliance with BFHI has a positive impact on short-term, medium-term and long-term breastfeeding outcomes. Education and support from professionals and/or peers, which is both timely and person-centred, is crucial to improving breastfeeding practices. Health professionals play a key role in providing education and support spanning the maternity continuum and early childhood periods.

Evidence also suggests that effective social support, peer support and influence from fathers/partners/families combined with reassurance and guidance from skilled practitioners can help women to overcome difficulties and find confidence in their own abilities to achieve their feeding goals.

Any breastfeeding promotion efforts and support should aim to enhance a mother's self-efficacy and confidence with respect to breastfeeding.

ii. Provide additional support to Aboriginal women, their partners, families and communities

Best Practice
NSW Health organisations work in partnership with mothers of Aboriginal infants, their families and communities to promote, protect and support breastfeeding.
NSW Health organisations implement culturally appropriate evidence-based interventions that promote and support breastfeeding.
NSW Health organisations collaborate with other relevant government, non-government and community organisations to promote, protect and support breastfeeding.

Aboriginal infants are less likely to be breastfed than non-Aboriginal infants. It is suggested that promoting breastfeeding to the wider Aboriginal community would assist to create a stronger breastfeeding culture, and would support Aboriginal women to breastfeed.

iii. Provide additional support to women and families at risk of lower rates of breastfeeding initiation and duration

Best Practice
NSW Health organisations provide additional breastfeeding support to these women and their families in the maternity continuum and early childhood periods.
NSW Health staff offer referral for women, to evidence based services/programs such as Australian Breastfeeding Association, Get Healthy in Pregnancy (GHiP), Quitline and Quit for new life.

Women at risk of lower initiation and duration of breastfeeding include:

- women who are less than 25 years of age
- obese women
- mothers of preterm and low birth weight infants
- women who smoke.

Mothers practicing early skin-to-skin contact with their newborns and kangaroo care, for infants in neonatal intensive care units, are more likely to breastfeed in the first one to four months of their child's life and continue for longer durations. Initiation of milk expression within one hour following birth increases milk volume in mothers of low birth weight infants.

Evidence highlights the effectiveness of parent groups, where peers are breastfeeding infants of a similar age, in improving breastfeeding rates/duration. Targeted peer counselling and social support, combined with professional support, is particularly important for younger mothers.

iv. Strengthen continuity of care, referral pathways and support networks

Best Practice
NSW Health organisations maintain an effective and timely referral system from maternity, neonatal and paediatric units to community based child and family health services.
NSW Health organisations collaborate with relevant local government, non-government and community organisations to support women and their families to breastfeed.

Continuity of care enables women to develop a relationship with the same caregiver(s) throughout the maternity continuum and early childhood. There is strong evidence demonstrating that continuity of care models support initiation and duration of breastfeeding.

Support in any form has been identified as a core component of programs to ensure good breastfeeding outcomes. Support provided for infant feeding may be from various sources including professionals, peer support and informal social networks. There is good evidence that a mixture of professional and peer support, for example as provided by the Australian Breastfeeding Association, is likely to be most effective in improving breastfeeding outcomes, particularly support around the perinatal period.

v. Support health professionals' education and professional development

Best Practice
NSW Health organisations ensure that the health workforce, caring for women and their families, complete the HETI My Health Learning Course Code: 45338916 *Breastfeeding Promotion, Protection and Support*
NSW Health organisations provide and support access to education and continuing professional development, based on the BFHI frameworks, to the health workforce caring for women and their families.

NSW Health organisations provide access to evidence based breastfeeding guidelines/resources for the health workforce caring for women and their families.

All health professionals play a key role in promoting, protecting and supporting breastfeeding. Breastfeeding education which increases the knowledge and confidence of medical officers, nurses, midwives, Aboriginal health workers and other health professionals can lead to success in improving breastfeeding outcomes.

Access to consistent evidence based information and empathic communication skills are essential to professional development. The WHO/UNICEF BFHI training package is an effective health professional education package. Continuing professional development will enhance the knowledge, attitude and skills of the health workforce, enabling identification of predictors and barriers to breastfeeding.

Information to support health workers to protect, promote and support breastfeeding can be accessed via both the NSW Health and the Australian Department of Health websites.

vi. Provide breastfeeding friendly workplaces

Best Practice
NSW Health employees are encouraged and supported to combine breastfeeding and work.
NSW Health organisations work towards achieving the Australian Breastfeeding Association Breastfeeding Friendly Workplace Accreditation.

Providing support for breastfeeding is crucial to fostering a workplace that is free of discrimination, offers equal employment opportunity and is family friendly while improving the health outcomes of children. Support for breastfeeding in the workplace aids in the retention of the workforce, helps to maintain the workforce skill base, lowers staff turnover and assists in increasing morale.

NSW Health is committed to fostering a supportive work environment for breastfeeding employees. NSW Health staff should refer to their relevant Awards and Determinations regarding provisions around breastfeeding and working.

NSW Health supports action at a state level by encouraging early childhood education and care environments to support breastfeeding through the NSW Health Healthy Eating Active Living Strategy.

vii. Ensure monitoring and surveillance

Best Practice
NSW Health seeks opportunities to develop a breastfeeding dashboard indicator linking it to relevant performance measurement tools at the national, state and local level.
NSW Health organisations monitor initiation and where able duration of breastfeeding rates.

Monitoring, research and evaluation are important to provide further insight into breastfeeding initiation and duration rates, as well as a better understanding of ways in which breastfeeding can be protected, promoted and supported. To date, all monitoring of breastfeeding in Australia has been completed by cross-sectional, retrospective or small regional cohort studies. While useful data are available, many studies use different definitions and sampling methods that make comparisons difficult.

In NSW, 'breastfeeding on discharge from hospital' is routinely collected via the Perinatal Data Collection.

viii. Support Australia's response to the Marketing in Australia of Infant Formulas: Manufacturers and Importers Agreement 1992 (MAIF)

Best Practice
NSW Health organisations inform employees of their responsibilities under the MAIF Agreement and support them in meeting these responsibilities.

NSW Health staff comply with all relevant polices, such as PD2005_415 *Sponsorships Policy - NSW Health*, PD2009_067 *Fundraising Policy,* PD2015_045 *Conflicts of Interest and Gifts and Benefits*

NSW Health is required to comply with responsibilities under the MAIF Agreement in particular the following clauses:

- Clause 4: Information and education
- Clause 5: The general public and mothers
- Clause 6: Health care system
- Clause 7: Health care professionals.

This document sets out the obligations of manufacturers and importers of infant formula and gives effect to the principles of the WHO Code in an Australian context.

NSW Health recognises the need to support staff to notify the Australian Government Department of Health of potential breaches to the MAIF Agreement. Additional information on the MAIF Agreement including Information for Lodging Complaints regarding breaches can be found at the Australian Government Department of Health MAIF Agreement webpage.

321(21/09/18)

BREASTMILK: SAFE MANAGEMENT (GL2023_021)

GL2023_021 replaced PD2010_019

GUIDELINE SUMMARY

NSW Health is committed to supporting the safe management of breastmilk in all NSW Health facilities to reduce the risk of misadministration of breastmilk and to manage any adverse incidents.

KEY PRINCIPLES

NSW Health facilities are required to reduce the risk of the misadministration of breastmilk. This includes ensuring that all babies have secure identification in place and babies are not separated from their mothers without a compelling reason.

All expressed breastmilk is required to be safely managed and education is to be provided to parents and carers about this management.

If a baby is exposed to the wrong breastmilk, the relevant health professionals must conduct risk assessments, order and interpret screening, and initiate treatment as required.

All screening, management plans, results and counselling must be documented in the relevant health care record.

Local health districts and specialty health networks must ensure relevant staff:

- receive education and training to support the safe management of breastmilk, to identify risks and to manage adverse incidents
- implement strategies to reduce risk of the misadministration of breastmilk
- implement appropriate management if a baby receives the wrong breastmilk
- develop local policy and guidelines to support families who choose to intentionally feed their baby unpasteurised breastmilk from a nominated non-birth mother
- develop local policy, guidelines and procedures to:
    - implement this Guideline
    - monitor practice
    - document appropriately.

The Breastmilk: Safe Management guideline is available at:
https://www1.health.nsw.gov.au/pds/Pages/doc.aspx?dn=gl2023_021

APNOEA MONITORS (GL2012_002)

GL2012_002 rescinds GL2005_069.

This Guideline replaces GL2005_069 Apnoea Monitors. It provides advice to clinicians that there is no objective scientific evidence that home apnoea monitoring devices are of any value in preventing Sudden Infant Death Syndrome (SIDS).

There is no objective scientific evidence that home apnoea monitoring devices are of any value in preventing Sudden Infant Death Syndrome. However, it is acknowledged that there is considerable community anxiety about Sudden Infant Death Syndrome and that home monitoring devices are available to the general public. It should be noted that there is no indication for apnoea monitoring for the general population.

It is recommended that only infants deemed to have had serious apnoea by a specialist paediatrician should be placed on apnoea monitoring and this should be accompanied by appropriate advice, training and support for parents. It is recommended that apnoea monitoring devices are only used in the following context:

a) Adequate counselling before and during home monitoring by appropriately trained personnel;
b) Adequate training in the use of monitor and resuscitation techniques;
c) Continuous availability of medical, technical and emotional support services.

These aims may be most readily achieved if the management of an infant undergoing home monitoring is supervised by a hospital or other facility with appropriate specialised staff, including paediatricians and social workers.

GROWTH ASSESSMENT IN CHILDREN AND WEIGHT STATUS ASSESSMENT IN ADULTS

(GL2017_021 issued 17/11/2017)

PURPOSE

To support core patient care, this document describes the following:

- A standardised approach to measuring weight and height in children and adults, and to measuring length and head circumference in younger children.
- Interpreting and recording these measurements as part of determining weight status.
- Key equipment and patient considerations around taking these measurements.

KEY PRINCIPLES

Weight and height measurement of children and adults – or weight, length and head circumference measurement of younger children – should be performed on a regular basis as part of providing good clinical care. For example, it is necessary to measure weight, height and head circumference in order to monitor children's growth. It is also necessary to measure weight and height (or length) to determine weight status in children and adults.

Standardised measurement and interpretation of weight, height, length and weight status, will improve the accuracy and usefulness of measurements over time and across facilities, and support clinical decision making.

USE OF THE GUIDELINE

This guideline helps clinicians perform weight, height, length, or head circumference measurements of their patients, and to use these measurements to assess their patients' weight status.

This guideline also helps managers design and establish workflow practices that enable routine measurements.

To download the guideline go to
Growth Assessment in Children and Weight Status Assessment in Adults

296(17/11/17)

CIRCUMCISION OF NORMAL MALE INFANTS (PD2020_035)

PD2020_035 rescinds PD2012_009

POLICY STATEMENT

Routine circumcision of normal infant males is **not** performed in public hospitals in NSWHealth. This **does not** apply to cases where there is a clear clinical need forintervention, nor directly to adult male circumcision.

Parents who request routine circumcision must be provided with accurate informationon the risks and benefits of circumcision.

SUMMARY OF POLICY REQUIREMENTS

Parents who request circumcision for their infant son must be provided with accurate,unbiased and up to date information about the risks and benefits of the procedure.

Two resources that are recommended for staff:

- The Royal Australasian College of Physicians (RACP) guide for parents RACP -circumcision a guide for parents.
- The Sydney Children's Hospital's Network Fact Sheet: SCHN factsheet - maleinfant circumcision.

Parents must also be referred to RACP statement on circumcision, RACP Statement -Circumcision.

THIS POLICY DIRECTIVE MUST BE READ IN CONJUNCTION WITH:

NSW Health Policy Directive *Waiting Time and Elective Surgery Policy* (PD2012_011) (**Section 2.3**: Circumcision is listed as a discretionary procedure "*that should not routinely be performed in public hospitals in NSW unless there is a clear clinical need to improve a patient's physical health")*

NSW Health Information Bulletin *Advice for referring and Treating Doctors – Waiting Time and Elective Surgery Policy* (IB2012_004).

332(07/10/20)

TIERED NETWORKING ARRANGEMENTS FOR PERINATAL CARE IN NSW

(PD2023_035)

PD2023_035 rescinded PD2020_014 and IB2022_026

POLICY STATEMENT

The tiered perinatal networks provide a structure to support pregnancy and birth care through the appropriate use of maternity and neonatal services (capability); access to care appropriate to the level of assessed patient need (patient flow); and a 'whole of health' approach to the management of demand (capacity).

This Policy Directive provides guidance for NSW local health districts, and services in the ACT on the structure, functioning and governance of tiered perinatal networks.

SUMMARY OF POLICY REQUIREMENTS

The Policy Directive refers to the care of women with high-risk pregnancy requiring referral and/or transfer of care to a higher-level facility. It describes maternal and neonatal services in NSW, their tiered perinatal network arrangements; the default protocol; the requirement for local health district operational plans and escalation pathways. Reference is made to unwell neonates who require higher level care at birth but does not include advice on the referral or movement of these patients.

Each tiered perinatal network is responsible for managing the service demands of its population. Higher level facilities are responsible for providing support, advice and management of the women who may require transfer within and across tiered perinatal networks.

Level 6 maternity facilities operate as a part of a statewide system of care and are required to support other tiered perinatal networks. Whenever a maternal transfer is needed the following principles apply:

- No woman is to be moved out of her tiered perinatal network without the advice of the tiered perinatal network Level 6 obstetric consultant.
- Women and their families are provided with timely and accessible information on the transfer process and offered support through Aboriginal Health Liaison Officers, Aboriginal Maternal and Infant Health Service staff, interpreters and/or other support services as required.
- The decision to transfer and determination of the urgency of transfer (medically agreed timeframe) must be made through discussion between the obstetric consultants at the referring and accepting facilities.
- Management of urgency and risk is aligned to the Maternal Transfers Decision Making Tool.
- Access to appropriate care must not be delayed due to maternal or neonatal bed finding. .
- The neonatal team is closely involved in the decision making/ care planning for planned high risk births or involved in the care of urgent transfers. However, where birth is not planned or anticipated within the next 12 hours, a neonatal bed is not required and obstetric decision making takes precedence.
- Obstetric consultant roster must be made available with contact numbers provided.
- No Level 6 to Level 6 maternal transfers should occur from 32 weeks. An exception could be where specific Level 6 neonatal services are required (such as surgical or cardiac).
- If during a transfer, there is deterioration in maternal condition the Aeromedical Control Centre must contact the obstetric consultant at the receiving facility for advice and transfer logistics.

- Higher level facilities are responsible for supporting the woman until transfer is complete, and for notifying the referring hospital if the destination changes.
- All facilities are responsible to accept return transfers from higher level facilities.

The view the entire Tiered Networking Arrangements for Perinatal Care in NSW policy go to https://www1.health.nsw.gov.au/pds/Pages/doc.aspx?dn=PD2023_035

347(19/10/22)

NSW PAEDIATRIC SERVICE CAPABILITY FRAMEWORK
(GL2017_010 issued 1/6/2017)

PURPOSE

Service capability describes the planned activity and clinical complexity that a facility is capable of safely providing. The NSW Paediatric Service Capability Framework (the 'Framework') identifies the scope of planned activity for each paediatric service capability level and provides a mechanism for Local Health Districts to assess the planned service capability of their facilities.

Facilities must be capable of providing, at a minimum, all the planned clinical services described for their level. The Framework supports the provision of high quality, safe and timely care for infants, children and adolescents as close to home as possible.

KEY PRINCIPLES

Paediatric medicine service levels range from no planned service to Level 6 in the major children's hospitals.

Surgery for Children service levels range from no planned service to Level 6. Level 6 paediatric surgery is provided in specialist children's hospitals where paediatric surgery and complex genetic and metabolic services are located. There is no level 5 Surgery for Children Service.

This Framework does not cover Level 6 services.

USE OF THE GUIDELINE

Local Health Districts are responsible for determining the paediatric service capability level of their facilities, taking into account the clinical support services available (e.g. pathology, diagnostic imaging).

The Framework also includes the Paediatric Service Capability and Surgery for Children self-assessment checklists for assessing the planned service capability of a facility and a methodology to assist in service planning and risk management for paediatric medicine and surgery for children.

The Framework is supported by the NSW Paediatric Service Capability Framework Companion Toolkit.

To download the guideline go to
NSW Paediatric Service Capability Framework

296(01/06/17)

MATERNITY AND NEONATAL SERVICE CAPABILITY (GL2022_002)

GL2022_002 replaced GL2016_018

GUIDELINE SUMMARY

This document guides NSW Health service executives, managers, clinicians, and health service planners in planning and delivering maternity and neonatal services. The guideline describes the planned activity and clinical complexity that a facility is capable of safely providing, and outlines the processes for assessment, notification and reporting.

KEY PRINCIPLES

Local health districts (districts) and specialty health networks (networks) are responsible for assessing, maintaining and reassessing the service capability level of their maternity and neonatal services. District/networks are responsible for annual reporting of maternity and neonatal service capability levels.

The Secretary of NSW Health must be notified in advance of any planned commencement of a new maternity or neonatal service and/or closure or restriction of the range of maternity or neonatal services.

District/networks are responsible for conducting relevant risk assessments for any planned or unplanned change to services to support safety and quality practices, or at the request of the Ministry of Health. Local processes must be in place to manage any identified risks to operating at a designated service capability level.

Maternity and neonatal managers and clinicians must deliver services in line with the designated service capability level of their facilities and partner with other services within tiered perinatal network arrangements so women and newborns can receive the right care in the right place at the right time.

Accessible information must be provided to women and their families in the antenatal period about the capability of their local service. This will help them understand the care that can be provided locally and what to expect if transfer for higher-level care is required.

Care at all levels of service capability needs to be woman/person-centred (maternity), familycentred (neonatal), culturally safe and appropriate and respond to the diverse needs of women and families including health, mental health, disability, psychosocial and safety needs (including child protection and domestic and family violence).

Maternity and neonatal services implement value-based health care to improve outcomes and experiences for patients, the population, clinicians and service providers, and ensure value for the system.

https://www1.health.nsw.gov.au/pds/Pages/doc.aspx?dn=GL2022_002

HUMIDIFIED HIGH FLOW NASAL CANNULA OXYGEN GUIDELINE FOR METROPOLITAN PAEDIATRIC WARDS AND EDs – 1ST EDITION (GL2016_004)

PURPOSE

The *Humidified High Flow Nasal Cannula Oxygen Guideline for Metropolitan Paediatric Wards and ED's, 1st edition* has been developed to inform practice for clinicians caring for infants and children. This guideline was developed by a representative group of NSW Clinicians with expertise in acute paediatric care, paediatric intensive care, and paediatric respiratory care as part of a joint project between The Office of Kids and Families and MP4 (Metropolitan Paediatric Level 4 Units Sydney) and is aimed at achieving the best possible care in NSW.

KEY PRINCIPLES

The guideline applies only to Metropolitan Paediatric Level 4 Units and Metropolitan Emergency Departments where paediatric patients are managed. It requires Chief Executives of Metropolitan Local Health Districts to determine where local adaptations are required or whether the guideline can be adopted in the current format.

The guideline reflects what is currently regarded as a safe and appropriate approach to commencement of Humidified High Flow Nasal Cannula Oxygen (HHFNC) and the care of infants while on HHFNC. The document should not be seen as a stringent set of rules to be applied without the clinical input and discretion of the managing professionals. Each patient should be individually evaluated and a decision made as to appropriate management in order to achieve the best clinical outcome.

USE OF THE GUIDELINE

Chief Executives of Metropolitan LHD's must ensure:

- Hospitals and facilities either adopt this protocol or adapt local protocols to comply with the *Humidified High Flow Nasal Cannula Oxygen Guideline for Metropolitan Paediatric Wards and EDs*
- Ensure that all staff treating paediatric patients are educated in the use of the locally developed paediatric protocols.

Directors of Clinical Governance are required to inform relevant clinical staff treating paediatric patients of this new guideline.

ATTACHMENTS

1. Humidified High Flow Nasal Cannula Oxygen Guideline for Metropolitan Paediatric Wards and EDs, 1st Edition: Guideline

INFANTS AND CHILDREN INSERTION AND CONFIRMATION OF PLACEMENT OF NASOGASTRIC AND OROGASTRIC TUBES (GL2016_006)

GL2016_006 rescinds GL2016_003

PURPOSE

The *Infants and Children Insertion and Confirmation of Placement of Nasogastric and Orogastric Tubes 1st edition* Guideline provides direction to clinicians and is aimed at achieving the best possible paediatric care in all parts of the state. The Procedural Guideline was prepared for the NSW Ministry of Health by an expert clinical reference group under the auspice of The Office of Kids and Families.

KEY PRINCIPLES

This Guideline applies to all facilities where paediatric patients are managed. It requires the Chief Executives of all Local Health Districts and specialty health networks to determine where local adaptations are required or whether it can be adopted in its current Clinical Practice Guideline format in all hospitals and facilities required to manage insertion and confirmation of nasogastric and orogastric tube placement in infants and children.

The Clinical Practice Guideline reflects what is currently regarded as a safe and appropriate approach to insertion and confirmation of nasogastric and orogastric tube placement in infants and children. However, as in any clinical situation there may be factors which cannot be covered by a single set of guidelines. This document should be used as a guide rather than as a complete authoritative statement of procedures to be followed in respect of each individual presentation. **It does not replace the need for the application of clinical judgement to each individual presentation.**

USE OF THE GUIDELINE

Chief Executives must ensure:

- This Guideline is adopted or local protocols are developed based on the *Infants and Children Insertion and Confirmation of Placement of Nasogastric and Orogastric Tubes 1st edition* Guideline
- Local protocols are in place in all hospitals and facilities likely to be required to insert a nasogastric or orogastric tube in a paediatric patient
- Ensure that all staff treating paediatric patients are educated in the use of the locally developed paediatric protocols.

Directors of Clinical Governance are required to inform relevant clinical staff treating paediatric patients of this revised guideline.

ATTACHMENT

2. Infants and Children Insertion and Confirmation of Placement of Nasogastric and Orogastric Tubes 1st Edition: Guideline.

MANAGEMENT OF SUDDEN UNEXPECTED DEATH IN INFANCY (SUDI) (PD2019_035)

PD2019_035 rescinds PD2008_070

PURPOSE

This Policy Directive outlines the mandatory requirements for management of Sudden Unexpected Death in Infancy (SUDI) in NSW Health facilities. It also outlines the role of NSW Health in the context of the NSW Government response to SUDI which includes the NSW Coroner and Police.

MANDATORY REQUIREMENTS

SUDI is a reportable death under the Coroners Act 2009.[1] Most SUDI deaths occur in the community and are brought to their local emergency department, however SUDI can also occur in hospital. NSW Health's role in management of SUDI includes that local health districts and specialty health networks must:

- Ensure that local policies that guide management of SUDI are easily accessible for staff. This includes emergency departments as well as other areas that SUDI may occur such as maternity, paediatrics and intensive care. Information for staff on how to access locally networked paediatric services should be included.
- Ensure that adequate resources and education are provided so that staff can meet the needs of the infant and the parents/carers, and that parents/carers have access to expert medical advice, nursing care and social work. If necessary, these can be accessed via locally networked paediatric services. In some instances the situation may warrant transfer of the infant to a higher level facility.
- Nominate a hospital contact who will coordinate the SUDI response for example a social worker or nurse. This health professional will provide support to the parents/carers and coordinate completion of documentation required by NSW Health. A list of roles and responsibilities of agencies and staff involved in the SUDI response is at Section 6.1 Response to Sudden Unexpected Death in Infancy (SUDI) - Roles and Responsibilities.
- Ensure that the infant's medical history is completed by a senior medical staff member and documented in the health care record. A checklist to support this is at Section 6.2 Medical History Guide – Sudden Unexpected Death in Infancy. A copy of the infant's health care record must be forwarded to Forensic Medicine (NSW Health Pathology) within 24 hours of the infant's death.
- Ensure that support is available for staff who provide care to infants and parents/carers who have experienced SUDI. If necessary, this can be accessed via locally networked paediatric services.

Ensure there are processes to maintain the quality of care and patient experience of SUDI cases. This includes incident notification, documentation, case discussion that includes the perspective of parents/carers and staff and implementation of any identified improvement opportunities.

IMPLEMENTATION

Local health district chief executives are responsible for:

- Assigning responsibility, personnel and resources to implement this policy.
- Establishing mechanisms to ensure the mandatory requirements are applied, achieved and sustained as usual processes in the instance of a SUDI. This should include nomination of an executive sponsor.
- Ensuring that any local policy reflects the requirements of this policy and is written in consultation with the hospital executive, clinical governance unit and clinical staff.

Management of Sudden Unexpected Death in Infancy (SUDI): Procedure.

1 INTRODUCTION

1.2 About This Document

Every year in NSW between 40 and 50 infants under the age of 12 months die suddenly and unexpectedly, with a cause unable to be determined immediately.[1] This procedure document explains and outlines NSW Health's role in the management of Sudden Unexpected Death in Infancy (SUDI) and should be used:

- When an infant is brought to a NSW Health facility, following a sudden, unexpected death
- When an infant is brought to a NSW Health facility after a 'near SUDI' and dies in hospital
- When there is a sudden, unexpected infant death during a hospital admission.

NSW Health's role in the management of SUDI includes:

- Care of the infant and the parents/carers
- Completion of the infant's medical history, with a copy of the infant's health care record forwarded to Forensic Medicine (NSW Health Pathology) within 24 hours of the infant's death
- Completion of the post mortem examination and liaison with other agencies involved in the Coronial process
- Participation in the NSW Government response to SUDI. A flowchart that outlines NSW Health's role in the SUDI response can be found at Section 6.1 Response to Sudden Unexpected Death in Infancy (SUDI) - Roles and Responsibilities.

The SUDI response outlined in this document aims to:

- Establish where possible, the cause of death and assist parents/carers and their families to understand how and why the death may have occurred
- Provide parents/carers with information about any potential health risks for surviving family members
- Ensure timely completion of the infant's medical history. A checklist to support completion of the infant's medical history is attached at Section 6.2 Medical History Guide – Sudden Unexpected Death in Infancy
- Support Forensic Medicine (NSW Health Pathology) to complete the post mortem examination, establish the cause of death and provide information for future SUDI prevention activities of NSW Health and other agencies
- Ensure that statutory obligations are met.2 This includes assisting the NSW Coroner and Police in their role of investigating the infant's death.

1.2 Changes From the Previous Policy

1. This Policy Directive emphasises the need to provide parents/carers with any support they may need, including medical and nursing care, social work and referral to other services such as Red Nose Grief and Loss
2. All episodes of SUDI are to be accepted and managed in hospital, regardless of whether the infant's death occurred in hospital or prior to presentation. Facilities without an onsite paediatrician, paediatric nurse or social worker and can access support via their locally networked paediatric services. For more information about locally networked paediatric services see GL2017_010 NSW Paediatric Service Capability Framework
3. Local Health Districts/Specialty Health Networks (LHDs/SHNs) are not required to have facilities designated to respond to SUDI. It is expected that all facilities are able to initiate a SUDI response
4. The SUDI Medical History Protocol has been revised. For more information see Section 6.2 Medical History Guide – Sudden Unexpected Death in Infancy (SUDI)
5. Information about requirements of a post mortem examination relates to Forensic Medicine and is therefore out of the scope for this policy.

1.3 Definitions

Sudden Unexpected Death in Infancy (SUDI):

The sudden, unexpected death of an infant:

- Less than 12 months of age
- And where the cause was not immediately apparent at the time of death.

This definition excludes infants who die unexpectedly in misadventures due to external injury (such as transport incidents) and accidental drowning.[3]

Sudden Infant Death Syndrome (SIDS):

The sudden, unexpected death of an infant:

- Less than 12 months of age
- With onset of the fatal episode apparently occurring during sleep, that remains unexplained after a thorough investigation including performance of a complete autopsy, review of the circumstances of the death and the clinical history.[4]

2 CLINICAL GOVERNANCE

2.1 Incident Notification

Where a sudden, unexpected death of an infant death occurs in the community and the infant is brought to a NSW Health facility, notification in the Incident Information Management System (IIMS) is not required and the presentation is to be managed as a SUDI, as outlined in this Policy.

As per NSW Health PD2014_004 Incident Management Policy all deaths in hospital that are unrelated to the natural course of illness must be reported promptly in the IIMS. The Ministry of Health must be notified of the incident via a Reportable Incident Brief (RIB) within 24 hours.

2.2 Health Care Record

Where a post mortem is to be conducted under the direction of the Coroner, the forensic pathologist (NSW Health Pathology) must have access to a copy of the infant's health care record. The health care record should be forwarded within 24 hours. For more information see 4.8 Management of the Infant's Health Care Record.

2.3 Case Review

Following an episode of SUDI, by the next business day, the senior medical officer overseeing the case should review the infant's health care record and address any outstanding issues, including any referrals or follow-up for the parents/carers have been arranged.

LHDs/SHNs should also review all SUDI cases, this may be as part of a mortality and morbidity meeting. Where possible, other agencies involved in management of the case should be invited such as Forensic Medicine (NSW Health Pathology), Ambulance and Police.

Forensic Medicine (NSW Health Pathology) may also invite clinical staff to participate in a multi-disciplinary review.

2.4 Staff Debrief

All staff involved in an episode of SUDI should be offered the opportunity to debrief, both with other staff and individually, if preferred, and be assisted in accessing other support services where required.

3 GENERAL PRINCIPLES

SUDI is a tragic event likely to create an intense response from the parents/carers and their families as well as health professionals. As there is no 'appropriate' response to an overwhelming experience such as SUDI, behaviour of the parents/carers and their families may seem unusual. The immediate care and support provided by health professionals can make a significant difference to parents/carers and their family's grief.

Regardless of the NSW Health facility that the SUDI case presents to, appropriate physical space that allows for privacy should be accessible so that discussions between the infant's parents/carers and staff can occur and that the SUDI response can be managed.

As with all episodes of patient care, where a SUDI case is managed in a NSW Health facility, accurate documentation in the health care record is required. For more information see NSW Health PD2012_069 Health Care Records – Documentation and Management.

4 PROCEDURE FOR MANAGEMENT OF SUDI

SUDI cases will present in various ways, all of which require initiation of the SUDI response outlined in this document. This includes unresponsive or deceased infants brought by their parents/carers or by Ambulance, with or without Police involvement. Infants may be pronounced deceased prior to arrival, on arrival to the Emergency Department (ED), or after admission. Each of these presentations is considered a SUDI case and should be managed as outlined below.

The roles and responsibilities of each agency (Health, Police, Ambulance, Forensic Medicine and the Coroner) has been summarised at Section 6.1 Response to Sudden Unexpected Death in Infancy (SUDI) - Roles and Responsibilities.

4.1 Sudden Unexpected Infant Death in the Community

- Any infant that dies suddenly and unexpectedly in the community is to be taken to their nearest ED
- On arrival, any immediate care should be provided as per usual ED practice and the ED senior medical officer and nurse in charge notified

- The ED senior medical officer is to verify the infant's death (extinction of life) and let the parents/carers know. The infant should be registered as a patient and admitted
- A decision is to be made as to who will coordinate immediate care of the infant and the parents/carers, this may be a senior nurse or social worker
- The infant's medical history must be completed by a senior medical officer, using the Medical History Guide – Sudden Unexpected Death in Infancy (SUDI) (Section 6.2). This should be the on-call paediatrician. If a paediatrician is not available, the locally networked paediatric service should be contacted to determine who will complete the infant's medical history
- Where the infant's death occurs outside of business hours, and social work is not available, clinical staff should provide a handover to social work by the next business day.

4.2 Sudden Unexpected Infant Death in Hospital

- Where a SUDI death occurs in a NSW Health facility, the Admitting Medical Officer (AMO) and nurse in charge of the shift are to nominate a staff member to coordinate care of the infant and the parents/carers, this may be a senior nurse or social worker
- The infant's death (extinction of life) is to be verified and the parents/carers informed
- The infant's medical history must be completed by a senior medical officer, using the Medical History Guide – Sudden Unexpected Death in Infancy (SUDI) (Section 6.2). This should be the AMO or on-call paediatrician. If a paediatrician is not available, the locally networked paediatric service should be contacted to determine who will complete the infant's medical history
- Where the infant's death occurs outside of business hours, and social work is not available, a handover from clinical staff to social work should be provided by the next business day.

4.3 Reporting a Death to the Coroner

As per NSW Health PD2010_054 Coroner's Cases and the Coroner's Act 2009 and IB2010_058 Coronial Checklist sudden and unexpected deaths are reportable to the Coroner.
Where any doubt exists as to whether a death should be reported, call the duty forensic pathologist or the clinical nurse consultant at the relevant Forensic Medicine (NSW Health Pathology) facility:

Business hours (8am - 4:30pm):

- Sydney (Lidcombe): 02 9563 9000
- Wollongong: 02 4222 5466
- Newcastle: 02 4935 9700

After hours calls should be directed to the Lidcombe Forensic Medicine facility. The relevant duty pathologist will be notified by the Lidcombe Forensic Medicine staff.

The State Coroner's Court may also be contacted for advice on 02 8584 7777.

Where a death is reportable to the Coroner, a death certificate must not be issued. Verification of death (extinction of life) is to be documented in the Report of a Death of a Patient to the Coroner (Form A) (State Form SMR010.510). For more information see NSW Health PD2015_040 Death – Verification of Death and Medical Certificate Cause of Death.

4.3.1 Police

Where an infant is brought to a NSW Health facility without any contact with Police, Police should be notified of the death via the Police Area Command so that Police can notify the Coroner. Police will liaise with Family and Community Services where required.

If the infant is brought to a NSW Health facility by Police, the senior medical officer in charge of the shift or their delegate should take a handover, including whether the death has been reported to the Coroner and whether the parents/carers have any objections to a post mortem examination.

Once the infant's death has been confirmed, Police, in their role representing the Coroner, are responsible for the care of the infant's body, timely transfer of the infant to the appropriate Forensic Medicine (NSW Health Pathology) facility and investigation of the infant's death. Police will organise formal identification of the infant, this is to occur before the infant's body leaves the hospital.

Where there is uncertainty or concerns about the roles and expectations of Police in a NSW Health facility, the senior medical officer and nurse in charge should discuss their concerns with the most senior attending Police officer. Any ongoing concerns should be escalated via the Hospital Executive and the Police Area Command.

4.3.2 **Notifying Forensic Medicine (NSW Health Pathology)**

Once Police have been notified, the senior medical officer must inform the duty forensic pathologist or clinical nurse consultant at the relevant Forensic Medicine of the SUDI death as soon as possible. Ideally this should be the senior medical officer who completes the infant's medical history.

Forensic Medicine should also be informed of any existing pathology samples taken prior to death, such as blood and urine, as these samples may be required for further testing as part of the Coronial investigation process. Contact details for Forensic Medicine are in Section 4.3.

4.4 Care of the Infant's Body

As per NSW Health PD2010_054 Coroner's Cases and the Coroner's Act 2009 the hospital in whose care the infant's body is in, is responsible for the safe custody of the body until it is removed by Police. This implies that the infant's body will be in the same condition as when the death occurred and includes no interference with cannulas, incisions or dressings.

All contact with the infant's body must be supervised by Police or a health professional. From arrival to hospital and/or the time of death, no evidence relating to the possible cause of the infant's death is to be altered. However parents/carers may stay with their infant, under supervision, and with support of the hospital contact person. The parents/carers may hold their swaddled infant, however handling of the infant's body should be limited. The parents/carers will be able to see their infant again after the post-mortem examination has taken place.
Hand/foot prints and locks of hair must not be taken until after the post mortem. Parents/carers can request that hand/foot prints and locks of hair are taken after the post mortem by the Forensic Medicine social worker.

4.5 Initial Care of the Parents/Carers

The hospital contact person is to coordinate care of the parents/carers, including organising a private space for discussions, access to toilets and refreshments, introductions to staff members, contacting of family/friends and access to any services they may need such as interpreter services, Aboriginal Liaison Services and religious/cultural organisations. Where parents/carers require medical review such as lactation advice or referral to mental health services, this should be discussed with the senior medical officer overseeing the SUDI response. See also Section 6.3 Factsheet - Breast care after the death of an infant.

On arrival to hospital parents/carers are to be informed of each step in the process, using terminology they can understand, and be given the opportunity to ask questions, including that:

- The circumstances of the infant's death means that the death is reportable under the Coroners Act.[5] Therefore any contact with the infant must be supervised by a health professional (or Police) at all times
- A comprehensive medical history of the infant and family members will be taken by a senior medical officer, while the infant's body is in hospital, to assist with establishing the cause of death
- The Police, in their role representing the Coroner, will likely ask questions about the circumstances of the infant's death and request that a next of kin formally identifies the infant's body
- The Police will explain the coronial process and provide them with a copy of the Initial steps after a death is reported to the Coroner brochure. Information provided should include:
    - That the purpose of the post mortem examination is to establish the cause of death
    - That the results of the post mortem may benefit surviving family members including siblings, for example by identifying any genetic diseases
    - Details of where the post mortem will occur
- The Coroner must be notified of objections to the post mortem. If the parents/carers decide to object to the post mortem:
    - The Coroner must be made aware of objections to the post mortem. If health staff become aware of objections to the post mortem, Police should be informed. Objections to the post mortem should be recorded in the infant's health care record
    - Assistance in exploring the objection should be offered, further information can be sourced from the social worker at the appropriate Forensic Medicine facility
    - If the parents/carers object to a post mortem, they will be contacted by a representative from the Coronial Information and Support Program to discuss the objection and post mortem
- The Forensic Medicine social worker will contact the parents/carers by the next business day after the infant's body is admitted to the Forensic Medicine facility. Information and support about the coronial process and viewing of the infant's body can then be discussed
- A representative from the Coronial Information and Support Program may contact the parents/carers following the post mortem to discuss any organ retention
- A Forensic Medicine social worker will contact the parents/carers to provide interim results of the post mortem.

4.5.1 Initial Care of Siblings

SUDI presentations are particularly difficult when siblings of the infant have witnessed the death, discovery or resuscitation attempts of the infant. The assessment and care of surviving siblings, who may also present to hospital, is an important part of care. LHD/SHN social work should be able to provide resources and referrals to services that can provide support for siblings experiencing grief and loss, such as Red Nose Grief and Loss.

4.6 Completion of the Infant's Medical History

The Medical History Guide - Sudden Unexpected Death in Infancy (SUDI) (Section 6.2) is to be completed by a senior medical officer, as soon as possible after the infant's death. This should be the on-call paediatrician. If the paediatrician is not available, the senior medical officer should contact the locally networked paediatric service to determine who will complete the infant's medical history.

The Medical History Guide - Sudden Unexpected Death in Infancy (Section 6.2) includes details about the infant's health, parents/carers and events in the hours leading up to the infant's death, including the exact position the infant was found and the response of the parents/carers. Some questions may seem intrusive however they relate to known risks for infant mortality and may assist with establishing the cause of death. Where possible, information provided by the parents/carers should be recorded verbatim. Parents/carers should be given the opportunity to ask questions and discuss any concerns that they have.

It is recommended that a second staff member, ideally the hospital contact person, is present throughout the discussion with the parents/carers, about their infant's medical history. If you choose to include Police as observers during the medical history discussion, it is recommended that roles are agreed on before the discussion starts. Parents/carers should be reassured that Police presence does not indicate an assumption of implication of the death of the infant.

Details of those present during the discussion should be documented in the health care record.

4.6.1 Child Protection and Wellbeing

There are cases of SUDI that are the result of a non-accidental injury or neglect, therefore the safety and care of any children the parents/carers are responsible for must be considered. Care should be provided as per NSW Health's PD2012_007 Child Wellbeing and Child Protection Policy.

Where there are concerns for the safety of any children the parents/carers are responsible for see:

- NSW Mandatory Reporter Guide
- Child Protection Helpline 132 111 (Family and Community Services).

NSW Health Child Wellbeing Units 1300 480 420 (Mon - Fri 8:30am - 5pm) can also be contacted for advice.

4.6.2 Screening for Metabolic and Genetic Diseases

In all SUDI cases, the senior medical officer should refer the infant's parents and siblings to their local GP for an ECG. More information can be found in NSW Health's Management of the Death of a Child in Hospital Resource.

The senior medical officer is to consider any conditions that may have implications for surviving family members for example metabolic disease or cardiac dysrhythmia. Features of possible genetic problems include a history of sudden, unexpected death in family members, recurrent syncope, epilepsy and drowning. If there are concerns, the medical officer should contact the relevant medical specialist about possible investigations of the infant and/or family members.

As the infant's death is reportable to the Coroner, no samples of any kind can be taken after death without the permission of the Coroner. If there is a request for peri-mortem specimen collection, call the forensic pathologist at the relevant Forensic Medicine facility. For contact details see Section 4.3.

4.7 Role of the GP

The paediatrician or senior medical officer is to contact the local GP to:

- Inform them of the infant's death
- Discuss any relevant information about the infant and the parents/carers
- Discuss investigations required, for example an ECG on the infant's parents and siblings
- Discuss advice provided about lactation
- Offer assistance with support and referral for the infant's parents/carers

4.8 Management of the Infant's Health Care Record

As per PD2010 054 Coroner's Cases and the Coroner's Act where a post mortem is to be conducted under the direction of the Coroner, the forensic pathologist must have access to a copy of the health care record as soon as possible.

The hospital is responsible for providing a copy of the health care record to the Coroner. Release of copies of health care records should be handled by the medical records department or their delegate. The health care record may be sent with the infant's body but should be collated, packaged and forwarded in a sealed envelope. Records should be sent to Forensic Medicine within 24 hours of the infant's death.

Admission documentation, the infant's medical history, the Ambulance clinical record, records of any medications given and the infant's growth charts should be sent to Forensic Medicine as part of the infant's health care record.

4.8.1 Following Transfer to Forensic Medicine (NSW Health Pathology)

Agencies that request a copy of the infant's health care record, including Forensic Medicine and Police, after the infant's body has been transferred to Forensic Medicine, should be referred to the hospital's medical records department.

If the infant's health care record is not received by Forensic Medicine within 24 hours of the infant's death, Forensic Medicine are to contact the hospital's medical record department.

Where a copy of the infant's medical history has not been received or further information is required, Forensic Medicine is to contact the senior medical officer who completed the infant's medical history. If the senior medical officer is not able to be contacted, the Director of Medical Services/Administration of the hospital or facility should be contacted.

4.9 Departure From the Hospital or Health Care Facility

Before parents/carers leave the hospital or health care facility, the hospital contact person should confirm any appointments made and discuss with the parents/carers notification of other health professionals previously involved in the infant's care.

Parents/carers may want to nominate a family member to act as a contact to assist with decision making on their behalf. Information, both written and verbal, about how to access further support and advice should also be provided such as:

- Child and Family Health Services
- Their local GP
- A medical specialist
- Mental Health Services
- Other health services such as the Aboriginal Maternal and Infant Health Service or NSW Refugee Health Service
- Red Nose Grief and Loss.

Practical assistance and advice should be offered to parents/carers including arranging transport home, care of siblings and funeral arrangements. Note parents/carers should not set a date for their infant's funeral until they have made contact with the Forensic Medicine social worker.

A representative from the hospital or health care facility overseeing care of the infant and the parents/carers should contact the parents/carers within a week of the infant's death, to offer support and confirm any referrals have been organised. This may be the social worker, the hospital contact person or the senior medical officer.

4.10 Forensic Medicine (NSW Health Pathology)

Once parents/carers have had the opportunity to spend time with their infant and the infant's medical history is complete, Police will arrange for the infant's body to be transferred to the appropriate Forensic Medicine facility. This should occur as soon as possible as extended delays can impact the post mortem examination and therefore timing of the report. Police arrange transfer of the infant's body via a government contractor, there is no cost for the transfer.
The hospital contact person should provide a handover to the Forensic Medicine social worker where the post mortem will occur. Contact details of the Forensic Medicine (NSW Health Pathology) social worker should be given to the parents/carers prior to transfer of the infant's body.

The Forensic Medicine social worker will:

- Accept a handover from the hospital contact person (usually by email)
- Contact the parents/carers to confirm that the infant's body has been admitted to the facility (by the next business day).

Forensic Medicine social work is available during office hours (8:00am to 4:30pm) at all sites. After hours social work service is available as follows:

- Sydney: 6pm - 10pm on weekdays, 8am - 8pm on Saturdays and Sundays
- Newcastle: 1pm - 5pm on Saturdays and Sundays
- Wollongong: no after-hours social work support is available however the Wollongong Hospital social work team may accommodate requests for viewings after hours.

While the Coronial process is ongoing, up until after the final post mortem report has been discussed, parents/carers who have experienced the sudden unexpected death of an infant can access support, advice and referral to other services from Forensic Medicine social work.

4.11 The Post Mortem Examination

A post mortem (or autopsy) is a detailed examination of a body by a doctor who has training in this field. A post mortem is requested by the Coroner to inform a balanced, accurate finding regarding the cause of death. In NSW, all post mortem examinations after a SUDI death are undertaken at one of the three Forensic Medicine facilities, in Sydney, Wollongong or Newcastle.

As per Section 4.5 Initial Care of the Parents/Carers the Forensic Medicine social worker will contact the parents/carers to provide interim results of the post mortem. The Forensic Medicine social worker will also:

- If requested, arrange for hand/foot prints and locks of hair to be taken
- Facilitate viewings of the infant's body after the post mortem
- Ask if the parents/carers would like to be contacted by a Forensic Medicine social worker when the final post mortem report is available
- Confirm that the infant's body can be released to the funeral director.

If organ retention occurred as part of the post mortem, the parents/carers will be contacted by a representative from the Coronial Information and Support Program (CISP) to discuss approval by the Coroner, release, retention timeframes and options for disposal or return of organs.

4.12 Final Post Mortem Examination Report

Once the final post mortem report is complete, the Coroner will notify the parents/carers via a letter. Parents/carers can request a copy of the final post mortem report, requests by the parents/carers must be made to the Coroner in writing, this may be via email. There is no charge to parents/carers for a copy of the report. Some of the tests undertaken are complex so it may take months for the post mortem report to be available. It is not uncommon for the post mortem report to be inconclusive.
Note that requests for a copy of the post mortem report from NSW Health to the Coroner, must be made in writing from the hospital's Director of Medical Services (DMS) or Director of Clinical Governance (DCG) directly to the relevant Coroner. If the senior medical officer or paediatrician overseeing care of the infant and the parents/carers would like a copy of the post mortem report they should contact their DMS or DCG.

Once the final post mortem report is available, if parents/carers agreed to be contacted, the Forensic Medicine social worker will contact the parents/carers and offer to discuss the report. The Forensic Medicine social worker can also assist parents/carers with requesting a copy of the post mortem report from the Coroner.

Parents/carers can discuss the post mortem report with the Forensic Medicine social worker and the forensic pathologist. Parents/carers can also discuss the report with the hospital contact person, social worker, senior medical officer, paediatrician or general practitioner involved in their care.

Where there are unanswered questions about the post mortem report, parents/carers or clinical staff can contact Forensic Medicine social work at the relevant Forensic Medicine (NSW Health Pathology) facility for further discussion. Forensic Medicine social work will facilitate any discussion with the forensic pathologist that is required.

During discussions about the final post mortem report, any referrals or further support required by parents/carers are to be provided.

6.2 Medical History Guide – Sudden Unexpected Death in Infancy (SUDI)

Medical History Guide - Sudden Unexpected Death in Infancy (SUDI)

The unexpected death of an infant is a tragedy for the parents/carers. Investigating infant deaths can be difficult as the situation is highly charged and emotional, and so it requires a unique and sensitive approach.

This guide includes high level of detail about the infant's health, the infant's family and events in the hours before the infant's death, including the infant's exact position and the parent/carer behaviour and use of alcohol or drugs. While these questions may feel intrusive, they relate to known risks for infant mortality, help determine why the infant died and can be asked in a sensitive way.

A detailed medical history will help the forensic pathologist determine a cause of death, including whether the infant may have suffocated, or died from an undiagnosed medical problem. The history is also important in determining the presence of risk factors for Sudden Infant Death Syndrome (SIDS) and any potential child protection concerns.

The following points may assist you with the discussion:

- Where possible, have another clinician, such as a social worker or nurse, with you during the discussion with the family to provide support. If you choose to include the Police as observers while you take the history, agree on roles before starting.
- To build trust with the parents/carers start with less sensitive questions including contact information, general family history, the mother's pregnancy and health, psychosocial aspects and the infant's health, before moving onto the events leading up to the infant's death.
- Use the infant's name whenever possible. The Medical History Guide – Sudden Unexpected Death in Infancy (Section 6.1) uses [infant's name] as a prompt.
- A suggested introduction is:

  'I am so sorry about your loss. Some people describe feeling that it is not quite real, like a nightmare. I would like to help make sense of what has happened. I would like to find out why [infant's name] died and help you understand why. To do that I would like to find out as much as possible about your pregnancy, [infant's name] general health and sleeping and feeding patterns. I also need to ask some questions about you and your health as it will help us understand why some young babies die suddenly. Please let me know if you are uncomfortable with any of these questions.'

Medical History Guide - Sudden Unexpected Death in Infancy (SUDI)

1. Identification

Infant's name
Date of birth
Date of death
Sex M/F
Ethnicity/Aboriginal/Torres Strait Islander
Address
Postcode

Personal information

Name of mother (and address if different from infant)
Date of birth
Name of father (and address if different from infant)
Date of birth
Consanguinity (degree of relatives)

Healthcare providers

Name of doctor completing the medical history
Social worker
Hospital contact person
Other professionals
Interpreter present
GP name and address

Information retrieved from medical record

As relevant, hospital, GP, midwife, infant's personal health record ('Blue Book')
Ambulance staff
Include growth chart in copy of medical record

Medical History Guide - Sudden Unexpected Death in Infancy (SUDI)

2. Details of transport of infant to hospital

Place of death, home address as above/another location (specify)
Time found
Time arrived in emergency department (triage time)
Resuscitation carried out
At scene of death – police/ambulance/emergency department/hospital
By who? Parents/carers/GP/ambulance paramedic/hospital staff/other (specify)
Confirmation of death
By who
Time and date
Location

3. Medical history

Taken to emergency department/hospital by
History given by
Relationship to infant

Family history

Details of family and household members, including names, dates of birth, health, any previous or current illnesses including mental health, medications, occupation
Maternal parity and obstetric history
Parental relationships
Children, including children by previous partner
Household composition
Any previous childhood deaths in the family

Social history

Type and nature of housing Major life events Wider family support networks History of family involvement with Family and Community Services Domestic and family violence Smoking, alcohol use
Infant's medical history Pregnancy and delivery, perinatal history, feeding, growth, behaviour and development Health and any previous or current illnesses, hospital admissions, medications Routine checks and immunisations Body systems review
Detailed narrative account of last 24 – 48 hours (To include details of all activities and carers during the last 24-48 hours) Any alcohol, medication consumed by parents/carers Any medication given to infant Details of infant's last sleep, including where and how placed to sleep Details of feeding and care given Further details of previous 2-4 weeks, including infant's health, any changes to routine, when infant last seen by a health professional
NSW Health PD2019_035 Management of Sudden Unexpected Death in Infancy Page 3
Medical History Guide - Sudden Unexpected Death in Infancy (SUDI)
Events surrounding death When infant was last seen alive and by who Who found the infant, where and when, appearance when the infant found Details of sleep environment, type of surface, mattress, bedding, objects, overwrapping or over-heating. Face or head covered. Co-sleeping. Alcohol or drugs consumed by carers. Who called emergency services Details of any resuscitation at home, by ambulance and in hospital For accidental/traumatic deaths, details of circumstances around the death, witnesses
Any other relevant history May vary according to the age of the infant, nature of the infant's death
Genetic or metabolic disease For concerns about genetic or metabolic disease, contact the paediatric metabolic specialist for advice about investigations required For concerns about a condition that may have implications for other family members, for example cardiac dysrhythmia, contact the relevant specialist for advice about investigations required
Child protection and wellbeing If you have any concerns about non-accidental injury or neglect, follow usual child protection procedures
4. Conclusion Cause of death From this history do you have an impression of the possible cause of death?

SCHN Factsheet - Breast Care After the Death of an Infant

Copies of this brochure can be accessed via the Sydney Children's Hospitals Network website:

Factsheet: Breast care for breastfeeding mothers after the death of a child

FACTSHEET

This fact sheet is for education purposes only. Please consult with your doctor or other health professionals to make sure this information is right for your child. If you would like to provide feedback on this fact sheet, please visit: www.schn.health.nsw.gov.au/parents-and-carers/fact-sheets/feedback-form.

Breast care for breastfeeding mothers after the death of a child

Time after the death of your infant can be physically and emotionally exhausting. It is important that you have support during this time. When milk is not regularly removed from the breast, milk production eventually stops of its own accord. Some women experience breast engorgement, leakage of milk, discomfort and some pain during this time.

Often the only treatment needed to stop making milk, is limiting milk removal. To give your body the message to stop making milk, it is best to express only enough to keep your breasts comfortable, unless you need to clear a blockage to prevent mastitis. Caring for your breasts at this difficult time is important, as it will help make them more comfortable and reduce the risk of a blocked duct or mastitis. The following suggestions may provide some relief during this time.

Suggestions as breasts become uncomfortable:

- Wear a well-fitting bra to provide firm breast support, rather than a tight breast binder.
- Breast pads will help absorb leaking milk. These can be the disposable or the reusable type. Change them as they become wet.
- Avoid excessive stimulation of the breast.
- Regularly applying cold compresses may provide pain relief e.g. chilled washers, cool gel packs or washed cabbage leaves can also help.
- Avoid excessive heat on your breasts.
- Consider taking analgesia as required to relieve pain and discomfort (for example paracetamol).
- Breasts should be handled gently during this time as they can bruise easily when engorged.
- Express a little milk to relieve fullness and make the breasts more comfortable. This won't interfere with the progress of suppression, as you are not emptying the breast. Hand expressing in a warm shower or bath can be effective as warmth and relaxation will encourage milk ejection without added nipple and breast stimulation.
- Maintain a normal fluid intake.

Things to watch out for:

- Engorgement- breasts become swollen, hard and painful. If this occurs it is recommended that you express your breasts completely once to relieve the pain. Then over the next few days express enough milk to keep your breasts comfortable. Applying cool packs, avoiding excessive heat and taking analgesia as needed to increase comfort may also help.
- Mastitis –lumps, red areas on the breast. Temperatures or flu like symptoms may indicate you have mastitis and medical assessment should be sought promptly.

How long will I have milk for?

It may take weeks or months for your milk to disappear completely. Leakage may occur for some time after discomfort has settled.

page 1 of 2

The day of the funeral:

This will be a difficult and emotional day. The following hints may be helpful to consider:

- Express milk for comfort before the funeral and during the day as required.
- Wear a bra which is comfortable and well supported. Your bra should not be too tight.
- There may be some leakage of milk, so be prepared with some extra breast pads.
- Patterned and dark coloured tops are often less likely to show wet patches.
- Jackets or cardigans may help cover up wet spots.
- Use analgesia as required, to help relieve breast pain.

It is important you are well supported during this difficult time.

Helpful organisations you may wish to contact for support include:

- SIDS and KIDS – phone 1300308307
  (24 hour bereavement support, counselling, support groups and workshops)
  www.sidsandkids.org
- Your local General Practitioner
- SANDS - phone 1300 0 sands (1300 072 637)
  (Still born and Neonatal Death support
  24/7 volunteer supporters are on call)
  www.sands.org.au
- Australian breastfeeding Association helpline - phone 18006862686
  www.breastfeeding.asn.au
- Grief line – phone 1300 845 745
  (Confidential and anonymous telephone support, including counselling in diverse languages)

6.4 Implementation Checklist

LHD/Facility:			
Assessed by:		**Date of Assessment:**	
IMPLEMENTATION REQUIREMENTS	**Not commenced**	**Partial compliance**	**Full compliance**
1. Local policies that guide management of SUDI are easily accesible for staff. This includes that all facilities are able to initiate a SUDI response.	❑	❑	❑
	Notes:		
2. Information about how to access locally networked paediatrics services is easily accessible for staff.	❑	❑	❑
	Notes:		
3. Adequate resources and education are provided so that staff can meet the needs of the infant and parents/carers, including providing parents/carers with support and relevant referrals.	❑	❑	❑
	Notes:		
4. Local guidance on allocation of the hospital contact person role is provided.	❑	❑	❑
	Notes:		
5. Local processes support transfer of the infant's health care record to Forensic Medicine (NSW Health Pathology) within 24 hours of the infant's death, and include a copy of the infant's medical history.	❑	❑	❑
	Notes:		
6. That support is available for staff who provide care to infant's and their parents/carers who have experienced SUDI.	❑	❑	❑
	Notes:		
7. Local processes maintain the quality of care and patient experience of SUDI cases.	❑	❑	❑
	Notes:		

RECOMMENDED SAFE SLEEPING PRACTICES FOR BABIES
(GL2021_013)

GL2021_013 resinds PD2019_038

GUIDELINE SUMMARY

The Guideline recommends safe sleeping practices to reduce the risk of Sudden Unexpected Death in Infancy (SUDI) and Sudden Infant Death Syndrome (SIDS).

KEY PRINCIPLES

Health professionals use a partnership approach to engage and work with families in a culturally sensitive manner to build relationships and find ways to support families to keep their babies safe.

Carers receive consistent, clear information about the recommended safe sleeping practices routinely and opportunistically in antenatal, postnatal, newborn care and community settings until the baby is 12 months of age.

Risk assessments are conducted at specified points in care for factors that may indicate a higher risk of SUDI.

All care and care planning, including risk assessments, must be documented in the health record.

USE OF THIS GUIDELINE

Local Health Districts and Specialty Health Networks must ensure relevant staff:

- receive education and training to provide safe sleeping information
- are aware of the evidence supporting the safe sleeping practices
- model safe sleeping practices
- are aware of the risk factors for SUDI and identify families who may require additional information, education and support
- develop local procedures and strategies to:
    - to implement this Guideline
    - monitor practice.

The Recommended Safe Sleeping Practices for Babies guideline is avaialbe at:
https://www1.health.nsw.gov.au/pds/Pages/doc.aspx?dn=GL2021_013

MANAGEMENT OF CEREBRAL PALSY IN CHILDREN - A GUIDE FOR ALLIED HEALTH PROFESSIONALS

(GL2018_006 issued 14/3/2018)

PURPOSE

Management of Cerebral Palsy in Children - A Guide for Allied Health Professionals provides recommendations, information and guidance to support the clinical decision making of allied health professionals regarding the management of children with cerebral palsy. The guideline was prepared for the NSW Ministry of Health by an expert clinical reference group and is aimed at achieving the best possible paediatric care in all parts of the state.

KEY PRINCIPLES

The guideline reflects what is currently regarded as a safe and appropriate approach to the management of children with cerebral palsy. However, as in any clinical situation there may be factors which cannot be covered by a single set of guidelines. This document should be used as a guide, rather than as a complete authoritative statement of procedures to be followed in respect of each individual presentation. **It does not replace the need for the application of clinical judgement to each individual presentation.**

As in any clinical situation and due to the heterogeneous nature of cerebral palsy, there are factors that cannot be covered by a single guide. Clinicians and clients need to develop individual treatment plans that are tailored to the specific needs and circumstances of the client. This guideline should be read in conjunction with other relevant guidelines, position papers, codes of conduct, and policies and procedures, at professional, organisational and Local Health District levels.

USE OF THE GUIDELINE

Chief Executives must ensure:

- This guideline is adopted or local protocols are developed based on *Management of Cerebral Palsy in Children - A Guide for Allied Health Professionals*
- Local protocols are in place in all hospitals and facilities likely to be required to care for children with cerebral palsy
- Ensure that all staff treating paediatric patients are educated and supported in the use of the locally developed paediatric protocols.

Directors of Clinical Governance are required to inform relevant clinical staff treating paediatric patients of this revised guideline.

To download this guideline go to
Management Of Cerebral Palsy In Children: A Guide For Allied Health Professionals

FEEDING DIFFICULTIES IN CHILDREN - A GUIDE FOR ALLIED HEALTH PROFESSIONALS

(GL2016_007 issued 18/2/2016)

PURPOSE

Feeding Difficulties in Children - A Guide for Allied Health Professionals provides recommendations, information and guidance to support the clinical decision making of allied health professionals regarding the management of children with feeding difficulties. The guideline was prepared for the NSW Ministry of Health by an expert clinical reference group under the auspice of The Office of Kids and Families and is aimed at achieving the best possible paediatric care in all parts of the state.

KEY PRINCIPLES

The guideline reflects what is currently regarded as a safe and appropriate approach to the management of children with feeding difficulties. However, as in any clinical situation there may be factors which cannot be covered by a single set of guidelines. This document should be used as a guide, rather than as a complete authoritative statement of procedures to be followed in respect of each individual presentation. **It does not replace the need for the application of clinical judgement to each individual presentation.**

As in any clinical situation and due to the heterogeneous nature of feeding difficulties, there are factors that cannot be covered by a single guide. Clinicians and clients need to develop individual treatment plans that are tailored to the specific needs and circumstances of the client. This guideline should be read in conjunction with other relevant guidelines, position papers, codes of conduct, and policies and procedures, at professional, organisational and Local Health District levels.

USE OF THE GUIDE

Chief Executives must ensure:

- This guideline is adopted or local protocols are developed based on *Feeding Difficulties in Children - A Guide for Allied Health Professionals*
- Local protocols are in place in all hospitals and facilities likely to be required to care for children experiencing difficulties with feeding
- Ensure that all staff treating paediatric patients are educated and supported in the use of the locally developed paediatric protocols.

Directors of Clinical Governance are required to inform relevant clinical staff treating paediatric patients of this revised guideline.

To download this guideline go to

Feeding Difficulties in Children - A Guide for Allied Health Professionals

296(18/2/16)

SUSPECTED CHILD ABUSE AND NEGLECT (SCAN) MEDICAL PROTOCOL
(GL2014_012)

PURPOSE

This protocol provides medical staff with a standard template and clinical guidance to record a forensically orientated medical assessment of a child or young person. A forensically oriented medical assessment is conducted to enable an opinion to be formed as to the probability that injuries have been caused intentionally or that neglect is present.

KEY PRINCIPLES

Medical staff are required under the *Children and Young Persons (Care and Protection) Act 1998* to provide medical examinations of children and young people in need of care and protection when requested by Community Services or the NSW Police Force, s173; or upon order of the Children's Court, s53. The SCAN Medical Protocol should be used to document these examinations. As a minimum this protocol should be used to document findings in all s173 examinations. An examining doctor is required to provide a written report to the Director General Community Services following completion of a s173 medical examination. The NSW Police Force, the Joint Investigation Response Team (JIRT) and Community Services are required to serve the hospital with a notice requesting s173 medical assessment.

USE OF THE GUIDELINE

The Protocol should be used in conjunction with NSW Health Policy Directive *PD2013_007 Child Wellbeing and Child Protection Policies and Procedures for NSW Health* which provides information to assist health workers to recognise and respond to child wellbeing and child protection concerns by setting out the legislation; the interagency and NSW Health policies that empower health workers; child abuse and neglect risk indicators; the mandatory reporting requirements and the tools and response mechanisms to children and young people suspected at risk of significant harm.

The NSW Health State Forms Management Committee has endorsed the SCAN Medical Protocol as a form for State-wide use. The Protocol can be accessed as a downloadable self-print document from the NSW Health print portal https://eprintondemand.salmat.com.au

NEONATAL ABSTINENCE SYNDROME GUIDELINES (GL2013_008)

GL2013_008 rescinds PD2005_494.

PURPOSE

These Guidelines specifically address the management of newborns to mothers with a history of opioid use or opioid dependence, including women currently receiving opioid substitution treatment (methadone or buprenorphine) or using prescription pharmaceutical opioids (such as oxycodone, morphine, pethidine or tramadol).

While Neonatal Abstinence Syndrome (NAS) is more common in infants born to opioid dependent women than in infants born to women dependent on other drugs, the effect of polydrug use on NAS is not clearly established and is most likely dependent upon the specific combination and quantities of drugs used by the mother.

Provided that neonatal abstinence syndrome is appropriately managed, it is not currently known to be associated with long-term health problems.

KEY PRINCIPLES

The Guidelines concentrate on two main aspects of care:

1. The care of the opioid-dependent pregnant woman from a drug and alcohol perspective based on "Harm Minimisation" principles, and;
2. The care of the newborn from a child protection perspective.

These guidelines should be used to guide clinical management; however clinicians must always consider the pregnant woman they are managing as an individual, and apply the guidelines appropriately.

Opioid dependent pregnant women have an increased risk of experiencing complications during pregnancy and of their infants experiencing adverse outcomes. The association is complex and may be affected by a range of factors including: poly substance use; inadequate antenatal care; poor nutrition; blood borne virus exposure; mental health problems; housing; and domestic violence. Births in mothers with opioid, stimulant or cannabis use diagnoses are associated with a number of negative neonatal outcomes. Babies are more likely to be born before the gestational age of 37 weeks, to be of low birth weight, and to be admitted to neonatal intensive care units or to special care nurseries than babies born to mothers without such a diagnosis.

Many women are more motivated during pregnancy to make important health and lifestyle changes. This is an ideal time to engage, or more fully engage, a woman in care for her drug use and other problems. A range of services are required to work collaboratively in order to ensure optimal outcomes for both the mother and newborn. The aim is to minimise the likelihood of complications and to provide comprehensive antenatal and postnatal care in a non judgemental, non-threatening environment.

USE OF THE GUIDELINE

While the focus of these Guidelines is opioid dependent women it is recognised that other illicit drugs such as stimulants, sedatives, alcohol and some psychotropic medications may also be associated with NAS and these women and newborns may have similar care needs. Therefore, the care elements of the Guidelines (which exclude elements specifically relating to opioid pharmacology as found in parts of Sections 8.1, 8.2 and 9.5) also apply to this group of women and their infants.

The Guidelines outline minimum standards for the management of NAS. Local Health Districts are responsible for ensuring that maternity services develop clear clinical protocols relevant to each maternity health care facility, based on these Guidelines.

Local policies and guidelines need to be formalised to ensure that the roles and responsibilities of the multidisciplinary team are clear. The guidelines provide advice on a continuum of care (Diagram 1), that includes care of the mother and infant from antenatal care through discharge and follow up.

A number of key priorities are identified in the NAS Guidelines and should be included in any local clinical guidelines or business rule: the early recognition and engagement of the opioid dependent pregnant woman and new mothers into multi-disciplinary team care (Section 6); the care of the newborn child Section 7); the postnatal care of both the mother and child (Sections 8, 9, 10); and the care and protection responsibilities of health workers clinically involved in the care of the newborn (Section 3).

Severe neonatal withdrawal is an indication for pharmacological management of NAS. The Neonatal Abstinence Score (or Finnegan Score – Refer Appendix 3) was developed to monitor the progress of infants experiencing neonatal abstinence due to opioid exposure in utero. It can be used as a trigger for pharmacological treatment of neonatal abstinence (Refer Section 8.2). Provided that neonatal abstinence is appropriately managed, it is not currently known to be associated with long-term health problems.

Section 5 deals with care of the mother's drug dependence during pregnancy and provides advice regarding withdrawal from heroin and assistance in determining a suitable Opioid Substitution Therapy, if required.

Section 6.6 provides advice regarding appropriate assessment and identification of risk for mother and foetus. This section outlines the process for prenatal reporting, including when reporting should be undertaken and the criteria used in assessing a need to report.

Section 8.2 outlines postnatal care of the infant. All infants born to drug dependent mothers should receive routine postnatal monitoring, along with specific assessment for the signs and symptoms of NAS using the Finnegan Neonatal Abstinence Severity Score (NASS) or modified Finnegan scale (See Appendix 3). Monitoring should commence within 2 hours after birth and be conducted 30 - 60 minutes after a feed. The score is an important guide for the appropriate pharmacologic treatment of NAS and health-care providers involved in the care of opioid-exposed infants must be educated in the appropriate application of these scores.

The issue of breastfeeding is complex because of the range of drugs used, their half-life and their interactions. Section 8.4 provides advice for breastfeeding based on the premise that breast milk is the most complete form of nutrition for infants, with a range of benefits for health, growth, immunity, and development. There are times however when the breast milk should be expressed and discarded, particularly following psychostimulant use.

RURAL PAEDIATRIC EMERGENCY CLINICAL GUIDELINES, THIRD EDITION

(GL2021_011)

GL2021_011 rescinded GL2020_016

GUIDELINE SUMMARY

The Guideline provides First Line Emergency Care Course (FLECC) trained nurses with best practice guidance for early management of acute and life-threatening conditions. It is relevant to rural and remote paediatric inpatient areas.

The Guideline aligns with the NSW "Between the Flags" program and facilitates management in the absence of immediate access to a medical officer. It improves overall care and outcomes for infants and children in rural and remote hospitals by allowing treatment to be commenced immediately.

KEY PRINCIPLES

The Guideline is designed to:

- improve emergency care and outcomes for patients in the rural and remote health care settings of NSW
- assist rural and remote Emergency Departments (EDs) in NSW achieve benchmarking targets and best practice standards for patients presenting to emergency
- provide best practice guidance, and to support the role that many Registered Nurses currently perform in rural and remote settings.

In circumstances where a patient meets more than one guideline, the most lifethreatening condition should take priority and the most appropriate corresponding guideline commenced.

USE OF THE GUIDELINE

Directors of Clinical Governance are required to inform relevant clinical staff treating paediatric patients of the revised Guideline. Implementation should occur in conjunction with the local Clinical Emergency Response System (CERS) and continuing professional development.

Chief Executives must ensure that:

- the Guideline is adopted or that local protocols are in place in all hospitals and facilities likely to be required to provide emergency treatment to infants and children
- emergency nurses have the opportunity to access the First Line Emergency Care Course (FLECC).

FLECC-trained nurses must ensure that:

- a designated medical officer is notified as soon as practicable

FLECC-trained nurses and medical officers must ensure that:

- medication standing orders contained and used in the Guideline are reviewed and authorised by the designated medical officer as soon as possible (within 24 hours) and;
- the medical officer countersigns the record of administration on the patients' medication chart

Enrolled nurses and registered nurses who are not FLECC credentialed using the guideline to inform assessment and management, are not to undertake shaded interventions that require FLECC credentialing unless previous recognition of prior learning has been granted.

The Guidelines can be downloaded at Rural Paediatric Emergency Clinical Guidelines, Third Edition

STANDARDS FOR PAEDIATRIC INTRAVENOUS FLUIDS: NSW HEALTH (SECOND EDITION) (GL2015_008)

GL2015_008 rescinds GL2014_009.

PURPOSE

Intravenous fluids are important components of appropriate care for hospitalised children. Reports in the medical literature and warnings issued in other countries have highlighted the risks associated with use of low sodium content fluids. The importance of appropriate glucose content has also been identified.

The NSW Chief Paediatrician was tasked to engage clinical experts, Healthshare and a range of other partners in the development of state wide standards across all NSW facilities. The resulting *Standards for Paediatric IV Fluids: NSW Health* addresses fluid content, bag size, labelling, administration, procurement and storage.

Emerging new evidence and clinical experience motivated an early revision of the Standards, resulting in this second edition.

KEY PRINCIPLES

The intended outcomes of the first edition of the standards regarding the content of IV fluids in children and neonates included:

- Reducing the risk of hyponatremia through increased sodium content and limiting the use of low sodium containing fluids.
- Addressing glucose requirements of children and neonates through increased glucose content.
- Consistent inclusion of potassium chloride as early as considered safe and appropriate.

The key changes in the second edition of the Standards regarding the content of IV fluids for children and neonates include:

- Incorporating further evidence supporting the use of isotonic saline solutions in IV maintenance therapy.
- Standardising the use of 1000mL bags in the care of children beyond the specialist children's hospitals.
- Incorporating Special Care Nursery practice and clarification around IV fluids for neonates.

The Statement of the *Standards for Paediatric Intravenous Fluids: NSW Health* (page 8) provides a summary of the recommended standards.

USE OF THE GUIDELINE

The following priorities have been identified to facilitate the implementation of *Standards for Paediatric Intravenous Fluids: NSW Health* (second edition) into all relevant clinical areas; Communication, Education and Raising Awareness, Integration into Practice, Procurement and Monitoring.

To download the Guideline please go to
Standards for Paediatric Intravenous Fluids: NSW Health (second edition)

STANDARDS FOR PAEDIATRIC INTRAVENOUS FLUIDS (IB2014_066)

PURPOSE

To advise clinicians and managers about the products recommended in the Standards for Paediatric IV fluids (GL2015_005) published in August 2015. The Standards address the appropriate choice of IV fluids and measures related to their procurement, storage and safe administration.

Chief Executives are to ensure that the requirements of this information bulletin are communicated to all appropriate staff.

KEY INFORMATION

All fluids recommended in the Standards are available for order from Baxter Healthcare. Some products are compounded and some products are manufactured in the Baxter Toongabbie facility.

Compounded IV Products

Products that are compounded in the Baxter Pharmacy need to be ordered taking into consideration the appropriate lead time (please see the ordering document below).

As they are compounded these products are generally more expensive. If there is sufficient high demand for a compounded product then it may become a custom manufactured product (also known as Therapeutic Goods Administration or TGA Schedule 5A) with storage and cost benefits to healthcare facilities.

The only way to reduce the price of these products is to consistently order according to the Standards.

Schedule 5A Solutions (AHK codes) are made in the Baxter Toongabbie facility and are ordered through Baxter Customer Service. For your first order only a Pharmacist will have to sign a TGA Schedule 5A form. This does not mean these IV fluids will always have to be ordered by your pharmacy department. All subsequent orders will be covered by the initial TGA form. You are not able to receive your order until this form has been completed and returned to Baxter Healthcare. Each individual AHK code must have a signed TGA form. Therefore, your Pharmacist may need to complete several forms for your institution.

IV Bag Sizes

500mL and 1000mL bags will be available to NSW facilities for an initial two years and usage monitored. As the Children's Hospitals only use the 1000ml bags, that price will be lower due to the higher demand. Fluids for neonates will continue to be supplied only in 500mL bags (or less).

Potassium Chloride Products

All products containing potassium chloride (including compounded products) will now be supplied with a pink over-pouch.

Pre-Packaged Bags

The practice of adding potassium chloride or glucose to paediatric IV fluids should be discouraged. If this practice is because of the cost of specific fluid bags, then the use of less expensive 1000mL bag versions should be considered in the interest of patient safety in paediatric areas (not for neonates).

It is strongly recommended that, wherever possible, pre-packaged bags of appropriate IV fluids are available and used with the correct concentrations of sodium, glucose and potassium, across all NSW facilities. The use of premade/pre-packaged IV Fluid bags in paediatrics is also encouraged by:

- Sydney Children's Hospitals Network - Intravenous Fluid and Electrolyte Therapy – Practice Guideline 2013 (page 5)
- Royal Children's Hospital, Melbourne - Intravenous Fluids Clinical Practice Guideline.

Paediatric Infusion Sets

As per NSW Health policy directive PD2010_034, Section 3.3.10 – *"Paediatric infusion sets with inline burette must be used for all children requiring intravenous therapy. An infusion pump should be used in all children".*

Ordering enquiries

For AHK and AHB Baxter IV fluid codes

Baxter Customer Service – Telephone - 1300 789646

For the compounded IVS.1000-5000 products Baxter
Pharmacy Services:
Telephone: 1800 227 487 or (02) 9848 1395

Fax: 1800 025 887 or (02) 9848 1155.

To avoid waste and reduce costs we encourage coordinated ordering across LHDs for the purchasing of less frequently used IV fluids.

Baxter – 2014 – Paediatric IV Fluids Order Form NSW

INFANTS AND CHILDREN: ACUTE MANAGEMENT OF ALTERED CONSCIOUSNESS IN EMERGENCY DEPARTMENTS (GL2014_019)

PURPOSE

The *Infants and Children: Acute Management of Altered Consciousness in Emergency Departments: first edition* Clinical Practice Guideline has been developed to provide direction to clinicians and is aimed at achieving the best possible paediatric care in all parts of the state. The Clinical Practice Guideline was prepared for the NSW Ministry of Health by an expert clinical reference group under the auspice of the state wide Paediatric Clinical Practice Guideline Steering Group.

KEY PRINCIPLES

This guideline applies to all facilities where paediatric patients are managed. It requires the Chief Executives of all Local Health Districts to have local guidelines/protocols based on the attached Clinical Practice Guideline in place in all hospitals and facilities required to assess or manage children with altered consciousness.

The clinical practice guideline reflects what is currently regarded as a safe and appropriate approach to the acute management of altered consciousness in infants and children. However, as in any clinical situation there may be factors which cannot be covered by a single set of guidelines. This document should be used as a guide, rather than as a complete authoritative statement of procedures to be followed in respect of each individual presentation. **It does not replace the need for the application of clinical judgement to each individual presentation.**

USE OF THE GUIDELINE

Chief Executives must ensure:

- Local protocols are developed based on the *Infants and Children: Acute Management of Altered Consciousness in Emergency Departments: first edition* Clinical Practice Guideline.
- Local protocols are in place in all hospitals and facilities likely to be required to assess or manage paediatric patients with altered consciousness.
- Ensure that all staff treating paediatric patients are educated in the use of the locally developed paediatric protocols.

Directors of Clinical Governance are required to inform relevant clinical staff treating paediatric patients of this new guideline.

To download the Guideline please go to
Infants and Children: Acute Management of Altered Consciousness in Emergency Departments

INFANTS AND CHILDREN: ACUTE MANAGEMENT OF COMMUNITY ACQUIRED PNEUMONIA (GL2018_007)

GL2018_007 issued 16/03/2018 rescinds GL2015_005.

PURPOSE

This Clinical Practice Guideline provides evidence based direction to clinicians in the acute management of community acquired pneumonia. It is aimed at achieving the best paediatric clinical care in the assessment and management of acute community acquired pneumonia and appropriate escalation responses across New South Wales.

KEY PRINCIPLES

This Guideline applies to all facilities where paediatric patients are managed. It requires Chief Executives of all Local Health Districts and specialty health networks to determine where local adaptations are required or whether it can be adopted in its current format in all hospitals and facilities required to manage children with community acquired pneumonia.

The Clinical Practice Guideline reflects what is currently regarded as a safe and appropriate approach to the acute management of community acquired pneumonia in infants and children. However, as in any clinical situation there may be factors which cannot be covered by a single set of guidelines. This document should be used as a guide, rather than as a complete authoritative statement of procedures to be followed in respect of each individual presentation. **It does not replace the need for the application of clinical judgement to each individual presentation**.

USE OF THE GUIDELINE

Chief Executives must ensure:

- This Guideline is adopted or local protocols are developed based on the Infants and Children: Acute Management of Community Acquired Pneumonia, March 2018 Clinical Practice Guideline.
- Local protocols are in place in all hospitals and facilities likely to be required to assess or manage paediatric patients with community acquired pneumonia.
- Ensure that all staff treating paediatric patients are educated in the use of the locally developed paediatric guidelines.

Directors of Clinical Governance are required to inform relevant clinical staff treating paediatric patients of this new guideline.

To download the Guideline please go to
Infants and Children: Acute Management of Community Acquired Pneumonia

STATEWIDE INFANT SCREENING – HEARING (SWISH) PROGRAM (GL2010_002)

PURPOSE

This document sets out guidelines for the SWISH program including screening protocols and referral pathways. In doing so, the guidelines describe roles and responsibilities of staff; equipment and protocols for screening, coordination, audiological assessment and paediatric medical assessment.

Technology is available to diagnose hearing problems in the neonatal period. Early identification and intervention are important, with research suggesting that intervention commencing by 6 months of age may result in optimal speech and language development and minimise the need for ongoing special education.

KEY PRINCIPLES

The Guidelines outline the responsibilities each stage has in the hearing screening pathway.
Each Area Health Service (Area or AHS) has a SWISH Coordinator responsible for implementing and managing the screening program across all facilities in their Area. This model allows SWISH Coordinators flexibility to meet unique needs in their Area Health Service. SWISH Coordinators have adopted innovative approaches to ensure maximum screening capture such as service agreements with private hospitals and employing dedicated screeners to meet local needs (eg. Indigenous and Culturally and Linguistically Diverse (CALD) populations). (Chapter 2 & 3)

SWISH diagnostic audiology services are provided through the three tertiary paediatric hospitals which are the acute care hubs of the three paediatric services networks which cover the state (Greater Western, Northern and Greater Eastern and Southern). These hospitals are:

- The Children's Hospital at Westmead;
- John Hunter Children's Hospital, Newcastle; and
- Sydney Children's Hospital, Randwick.

Jim Patrick Audiology Centre is used as an overflow site for unilateral referrals in the Greater Western service network. Jim Patrick Audiology Centre is part of the Royal Institute of Deaf and Blind Children. (Chapter 4)

All referred newborns receive an audiological assessment. If a hearing loss is detected medical assessment and family support is available. A child who is diagnosed with hearing loss in the program could be referral to *Australian Hearing,* SWISH Hearing Support Services and other medical specialists. (Chapter 5)

If diagnosed as having hearing impairment, newborns are provided with options available for intervention services appropriate to the degree of hearing loss and specific diagnosis. Support is provided by the diagnosing Audiologist and SWISH Parent Support (Social Worker) in assisting parents to make the decisions. Parents are also consulted about early intervention, eg. hearing aids, cochlear implant and educational programs. (Chapter 6)

USE OF THE GUIDELINE

The Guidelines of the Statewide Infant Screening - Hearing (SWISH) program are to be used by staff working specifically within the following roles of the NSW Statewide Infant Screening - Hearing program both in public and private sectors.

- Screening Staff (Chapters 2 and 3)
- Area Health Service SWISH Coordinators (Chapters 2 and 3)
- SWISH Diagnostic Audiologists (Chapter 4)
- SWISH Paediatricians (Chapter 5)
- SWISH Parent Support (Social Workers) (Chapter 6)

The Guidelines can be accessed at http://www.health.nsw.gov.au/policies/gl/2010/GL2010_002.html

SAFETY AND WELLBEING OF CHILDREN AND ADOLESCENTS IN NSW ACUTE HEALTH FACILITIES (PD2022_053)

PD2022_053 rescinds PD2010_032, PD2010_033, PD2010_034

POLICY STATEMENT

NSW Health recognises that the physical, developmental, social and emotional needs of children and adolescents change over time, are unique and are different to the needs of adults. Children and adolescents are among the most vulnerable groups in healthcare settings.

NSW acute health facilities must provide care in line with children and adolescent's individual needs, capabilities, maturity and independence; consider the different risks of harm and have strategies in place to mitigate them.

SUMMARY OF POLICY REQUIREMENTS

The promotion of safe, reliable, and effective patient centred care for children and adolescents is underpinned by the following principles as described in the Charter on the Rights of Child and Young People in Healthcare Services in Australia.

Children and adolescents being cared for in NSW Hospitals can expect:

- the highest attainable standard of healthcare
- equity of access and care for vulnerable population groups including Aboriginal peoples, people who live in rural and remote areas, culturally and linguistically diverse (CALD) communities, people with mental illness, children with intellectual or physical disability and those from socio-economically disadvantaged areas
- their best interests are the primary concern of all involved in their care care provided in line with their developmental stage and ability
- to be kept safe from all forms of harm
- care that supports their gender identity and expression trauma-informed care
- to be able to express their views, and to be heard and taken seriously
- respect for Aboriginal cultures, including recognition that health refers to social, emotional and cultural wellbeing
- respect for themselves as a whole person, as well as respect for their family and the family's individual characteristics, beliefs, culture and context
- to have their family relationships supported by the service providing care information to be provided in a form than is understandable to them
- to participate in decision-making and, as appropriate to their capabilities, to make decisions about their care
- to have their privacy respected
- to participate in education, play, creative activities and recreation
- continuity of healthcare, including well-planned care that takes them beyond the paediatric context.

Local Health Districts and Speciality Health Networks must communicate the information contained within this Policy to relevant facilities and staff; and ensure that consistent local policies are developed and distributed to relevant clinical areas.

Local Health District Chief Executives are responsible for assigning responsibility, personnel and resources to implement this Policy; establishing mechanisms to ensure the mandatory requirements are applied, achieved and sustained. Chief Executives are also responsible for ensuring that any local policy reflects the requirements of this policy and is written in consultation with the hospital executive, clinical governance unit and clinical staff.

1. BACKGROUND

This document was written in consultation with a reference group of clinical experts. Extensive statewide consultation informed further changes to the document.

This document includes:

- principles underpinning the care, safety and wellbeing of children and adolescents
- standards for the provision of clinical care
- standards for safety.

These principles and standards are essential components that enable NSW hospitals to provide care in the right place, at the right time, as close to home as possible.

1.1 About this document

The purpose of this Policy is to promote the safety and wellbeing of children and adolescents in NSW hospitals and acute health services.

This Policy applies to all acute health facilities where paediatric and adolescent patients are cared for. It mandates standards to ensure children and adolescents receive safe and appropriate care whilst in acute facilities.

This Policy must be followed by all organisations delivering acute health services. It is the responsibility of Local Health Districts / Speciality Health Networks to:

- communicate the information contained within this Policy to relevant facilities and staff; and
- adhere to and implement this Policy.

1.2 Key definitions

Admitted patient	An admitted patient is a person: (i) whom a clinician with admitting rights to the facility has determined meets the admission criteria (ii) has undergone the admission process (iii) has not been separated by the facility. A patient treated solely within the ED is not an admitted patient.
Child and Adolescent under Assumption of Care Order	A child or adolescent who has been removed from the care of their parents/carers and their care has been assumed by Department of Communities and Justice.
Child and adolescent	For the purpose of this Policy, a child and adolescent is defined as aged up to their 16th birthday. This Policy recognises that the needs of children and adolescents change with their age and developmental stage.
Paediatrics	The branch of medicine centred on the health and medical care of children and adolescents until transition to adult health services.
Parents/carers	Parents and carers is a broad term including those who are closest to the patient in knowledge, care and affection, for example parents, siblings, grandparents, aunts, uncles, cousins, friends, kin and carers. It also includes guardianship arrangements and extended familial relationships and kinship relationships for Aboriginal communities.

NSW Hospitals and Acute Health Services	This Policy covers health facilities and services where children and adolescents are treated and where the primary clinical purpose or treatment goal is to: • cure illness or provide definitive treatment of injury • perform surgery (other than when the exceptions documented in the included guidelines apply) • relieve symptoms of illness or injury • reduce severity of an illness or injury • perform diagnostic or therapeutic procedures, and/or • protect against exacerbation and/or complication of an illness and/or injury which could threaten life or normal function. This policy includes Children's wards or units in NSW Hospitals and other areas in NSW Hospitals and outpatient services that treat children and adolescents. It does not include community health services.
Mature Minor	A minor who has a sufficient level of understanding and intelligence to enable them to understand fully what medical or healthcare treatment is proposed. Mature Minors may independently consent to or refuse medical or healthcare treatment (see the NSW Health Consent to Medical and Healthcare Treatment Manual). There is no set age at which a child or young person is capable of giving consent. It depends upon the treatment being proposed and the minor's ability to fully understand the implications of that treatment. The term Mature Minor is interchangeable with the term Gillick Competent. A court may still override a Mature Minor's consent to or refusal of treatment in the Mature Minor's best interests.
Paediatric admission	A paediatric admission refers to children and adolescents under 16 years of age. Adolescents aged 16 years and older will usually be admitted to an adult ward or hospital. By exception, some 16 and 17 year olds may be admitted to a children's ward/hospital following negotiation, including older adolescents who have not completed transition to adult health services for chronic or complex care.
Paediatric safe bed or environment	A safe bed or space is an environment which meets the physical, developmental, social and emotional needs of children and adolescents.
Safety	Avoidance of harm to patients from the care that is intended to help them, this includes consideration of harms in regard to: • cultural safety • medication safety • mental health safety • emotional safety • sexual safety • online safety • physical safety • infection prevention and control.
Transition	The purposeful planned movement of adolescents and young adults with chronic physical and medical conditions from child-centred to adult oriented health care systems.
Trauma informed care	Trauma-informed care recognises the impact that traumatic events have on a child or adolescent's wellbeing. Trauma informed care involves: • understanding the impact of trauma on children and the family • providing care in a place that is physically and emotionally safe

	• ensuring the workforce is culturally competent and can implement practices that are respectful of cultural backgrounds • helping children and adolescents who have been victims of trauma regain control of their day-to-day lives. • including communities in governance processes and decision-making about the design of services.
Zero tolerance	A zero-tolerance approach means that as far as reasonably practicable action will be taken to prevent violence. Appropriate action will be taken to protect staff, patients and visitors from the effects of violence, while ensuring clinical services continue to be provided in a way that maximises the safety of patients, staff and others. Action may include both clinical and / or non-clinical interventions as appropriate.

1.3 Legal and legislative framework

NSW Hospitals and Acute Health Services have statutory obligations regarding the care and protection of children and young people under the Children and Young Persons (Care and Protection) Act 1998.

For more information about other legal obligations with regards to the safety and wellbeing of children, please refer to relevant Policy Directives, or contact the Legal Branch at NSW Health for assistance.

2. CLINICAL CARE

Services must align with the eight standards outlined in the National Safety and Quality Health Service Standards.

2.1 Alignment with role delineation and service capability

NSW Hospitals must provide a defined scope of services as described in the NSW Health Guide to the Role Delineation of Clinical Services.

All NSW Hospitals must provide clinical services in line with the facility's scope of services for paediatric medicine and surgery for children and adolescents.

The NSW Health Guide to the Role Delineation of Clinical Services describes the minimum support services, workforce and other requirements for clinical services to be delivered safely. Service capability describes the planned activity and clinical complexity that a facility is capable of safely providing.

The NSW Health Guideline *NSW Paediatric Services Capability Framework* (GL2017_010) identifies the scope of planned activity for each paediatric service capability level and supports the provision of high quality, safe and timely care for infants, children and adolescents as close to home as possible.

NSW Youth Health Framework 2017-24

2.2 A Networked Approach

NSW Health services must use appropriate networks to support the provision of high-quality healthcare across NSW as close to home as possible. There are a range of networks including the NSW Children's Healthcare Network, the Agency for Clinical Innovation Paediatric Network and other relevant peer networks.

Suggested links and reading
The Children's Healthcare Network The ACI Paediatric Network
The ACI Network Pages

2.3 Triage and Assessment in Emergency Departments

Triage is an essential function in Emergency Departments (EDs) and ensures that patients are treated in the order of their clinical urgency with reference to their need for time-critical intervention.

EDs must comply with the NSW Health Policy Directive *Triage of Patients in NSW Emergency Departments* (PD2013_047) which outlines the role, key responsibilities and the processes that support efficient and safe triage.

Following triage, the NSW Health Policy Directive *Emergency Department Patients Awaiting Care* (PD2018_010) outlines the requirements for communication, the environment, recognition of deterioration and commencement of clinical care.

Suggested links and reading
Guidelines on the implementation of the Australasian Triage Scale in Emergency Departments
The ACI: Paediatric Network Resources

2.4 Recognising and Responding to Deteriorating Patients

NSW Health Policy Directive *Recognition and management of patients who are deteriorating* (PD2020_018) mandates that local systems, structures and processes must be in place to support the recognition, response to and management of the physiological and mental state deterioration of patients.

Clinicians who provide care for children and adolescents must understand the clinical differences between deteriorating children, adolescents, and adults. This includes training in the recognition of the sick and deteriorating child or adolescent.

All NSW Hospitals must ensure all staff are made aware of the local Deteriorating Patient Safety Net System, including how to activate their local Clinical Emergency Response System (CERS), and their roles and responsibilities under the system. This includes
R.E.A.C.H. (Recognise, Engage, Act, Call, Help is on its way) for patients and parents/carers to escalate concerns about changes to a patient's condition.

All clinicians who provide direct patient care must complete the mandatory Between the Flags - Deteriorating Patient Learning Pathway training, including the Paediatric patient module.

2.5 Plan of Care

Paediatric patients in a hospital must have a clearly defined and documented treatment plan of care that includes:

- the name and contact details of the Attending Medical Officer (AMO) a diagnosis (provisional or definitive)
- a treatment plan consistent with clinical practice guidelines a plan for hydration, nutrition and fluid balance
- observation type and frequency, outline in the deteriorating patient policy expected frequency of clinical review and estimated date of discharge, and
- changes in patient condition aligned with the deteriorating patient policy.

A comprehensive and contemporaneous record of care must be documented in the patient's health record with changes in condition noted at the time they occurred including actions taken.

The process of care planning must reflect the preferences of the child, the adolescent, and their parents/carers and:

- be tailored to children and adolescents' individual needs
- consider the need for attachment, which allows a patient to connect with and gain reassurance from their parent/carer during times of need or distress
- involve the planning for continuity of care after admission.

All children and adolescents admitted to NSW Hospitals must have a risk screen completed to identify, escalate, and manage risks or concerns.

Clinicians must consistently use the risk screening and assessment approaches and processes as directed by state, district or network, and facility policies.

Districts, networks and facilities must facilitate access to validated screening tools and provide clinicians with clear pathways to follow when screening to identify need for further assessment and planning of risk mitigation strategies.

CEC: Fall and entrapment prevention

2.6 Escalation of Care

NSW Hospitals must have escalation plans in place to ensure the appropriate accommodation of a sick or injured child and/or adolescent, in accordance with NSW Health Policy Directive *Critical Care Tertiary Referral Networks (Paediatrics)* (PD2010_030) and NSW Health Policy Directive *Emergency Paediatric Referrals* (PD2005_157).

2.7 Consultation with on-call Specialists

General Practitioners who admit children or adolescents under their care must contact the local or regional paediatrician within 12 hours of admission to develop a collaborative plan for ongoing management. Consultation is required daily thereafter, or when there is handover to a new admitting doctor.

Consultation is required at any time when there is deterioration, inadequate response to treatment, diagnostic uncertainty or activation of the Clinical Emergency Response System (CERS) by staff, the patient or family/carer. Clinicians must refer to the local facility's CERS which outlines the requirement for response to a deteriorating patient within its care. The local CERS must include the escalation process for transferring patients that require higher- level care to a facility that can provide it.

Decisions regarding inpatient care for children and adolescents with mental health problems must be determined in line with the NSW Health Policy Directive *Children and Adolescents with Mental Health Problems Requiring Inpatient Care* (PD2011_016).

2.8 Workforce

Children and adolescents must be cared for by staff with appropriate skills, experience and qualifications to meet their physical, psychological, developmental, communication and cultural needs.

Staff caring for children and adolescents must have completed statewide and Chief Executive directed mandatory training requirements for clinical staff who provide care for children and adolescents. The mandatory training Matrix and Targeting Guide provides an overview of mandatory training requirements.

Completion of Health Education and Training Institute (HETI) core training modules in paediatric resuscitation, recognition of the deteriorating patient, child protection training, and, for staff administering medication, paediatric medication safety training, are recommended. Staff caring for children and adolescents must keep up to date with any changes to the mandatory training requirements.

All wards/units/departments must have access to clinical education.

There must be a nurse/midwife with appropriate experience in the In Charge of Shift role where a Nurse Unit Manager is absent. To ensure safe systems of work and patient safety, staffing should be determined by consideration of:

- requirements for paediatric drug checking and various other patient-related procedures
- the number and acuity of the patients within each ward, unit and department within a clinical service
- the skill level of nurses required to provide care.

Suggested link
Public Health System (Nurses' and Midwives') State Award

2.9 Improving Access to Care

To ensure children and adolescents receive the right care, at the right time, closer to home, NSW Hospitals must:

- provide a range of modalities of care to support the provision of child and adolescent care (this may include but is not limited to Hospital in the Home (HITH), outpatient and ambulatory care clinics, and virtual care, also known as telehealth)
- provide access to appropriate specialist staff and facilities in line with and networking arrangements and service capability.

Suggested reading
NSW Health Guideline *Adult and Paediatric Hospital in the Home Guideline* (GL2018_020)

2.10 Outpatient Care

Outpatient services for children and adolescents must be provided in line with the NSW Health Guideline *Outpatient Services Framework* (GL2019_011) and ensure the provision of youth friendly services for adolescents as outlined in the NSW Health Policy Directive *NSW Youth Health Framework 2017-24* (PD2017_019).

2.11 Continuity of Care

Systems must be in place to ensure continuity of healthcare, including:

- coordination between and within the various services working with children, adolescents and their parents/carers
- continuity across different geographically locations post discharge care
- appropriate planning for transition to adult services for those with chronic/long term health issues.

Suggested links and reading
NSW Health Policy Directive Departure of Emergency Department Patients (PD2014_025) CEC: Safety Huddles

3. SAFETY PROCEDURES

3.1 Safety of children and adolescents whilst in care

NSW Hospitals must ensure the safety of children and adolescents in terms of the following:

- cultural safety
- medication safety
- mental health
- safety emotional safety
- sexual safety
- online safety
- physical safety
- infection prevention and control.

All children and adolescents must be located in a paediatric safe bed regardless of the availability of a paediatric ward or unit.

A paediatric safe bed is a bed, located anywhere within a facility (including ED, imaging or a general ward or unit), that meets the criteria for ensuring the safety of the child and adolescent in line with the following principles.

Children and adolescents must be:

- cared for in a safe and appropriate environment that meets their physical, developmental, cultural and psychosocial needs
- easily observed and supervised at all times
- protected as much as possible from the sights and sounds associated with adult care in areas outside of designated paediatric wards, including EDs, Radiology, Operating Theatres and Recovery
- safe from harm from other patients, parents/carers and staff
- cared for by appropriately trained and skilled staff with access to ongoing professional development, current clinical guidelines and timely clinical guidance and advice
- communicated with and listened to in a manner that enables understanding and respect

NSW Hospitals that provide care to children and adolescents must:

- allocate the necessary workforce capacity to meet the needs of patients
- facilitate access to an Aboriginal Health Worker for cultural consideration for Aboriginal children and adolescents
- implement screening, supervision and training to staff to ensure children and adolescents are free from harm
- ensure the individual characteristics, beliefs and cultural contexts of the child, adolescent and their parents/carers are respected
- ensure that Healthcare interpreter services are available and offered to all children, adolescents and their families who do not speak English, or speak English as a second language
- facilitate support for children and adolescents from parents/carers, including the ability for a parent/carer to be accommodated with the child or adolescent
- enable patients to be partners in their own care, to the extent that they choose
- ensure that children, adolescents and their parents/carers are provided with information about their health care that takes into account their level of health literacy
- provide appropriately sized medical equipment, furniture and amenities
- ensure that painful procedures do not occur within a child or adolescent's bed space unless it is an emergency, there are infection concerns or moving the patient will cause more distress
- provide care and support to children, young people, parents/carers to minimise pain, anxiety and distress associated with treatment and procedures

- ensure compliance with NSW law on obtaining consent to medical treatment from patients or their substitute consent providers in line with the NSW Health Consent to Medical and Healthcare Treatment Manual. This includes enabling consent to treatment by mature minors (see definitions) who have the capacity to understand fully what medical or healthcare treatment is proposed.
- Where there are separate paediatric areas within EDs, they must remain available for children or adolescents.

Sydney Children's Hospitals Network: TRAPEZE

3.2 Cultural safety

NSW Hospitals must have strategies in place to ensure access to safe and holistic healthcare that supports Aboriginal peoples and people of culturally and linguistically diverse (CALD) backgrounds as partners in their own care.

NSW Health staff must have an understanding of health equity. Staff must provide healthcare that is responsive to the needs of Aboriginal and CALD children, adolescents and their families. All children, adolescents and their families who do not speak English, or speak English as a second language must be offered a NSW Healthcare Interpreter.

Section 2, Part F of the NSW Health guide to the role delineation of clinical services, outlines the levels of complexity for Aboriginal health services provided within any service level.

NSW Health guide to the role delineation of clinical services

3.3 Co-location of Adults with Children or Adolescents

The safety of the child or adolescent must be the primary consideration in decisions about co-location of adults and children/adolescents.

In a paediatric ward there must be only child and adolescent admissions.

Where there is an exceptional need for the child/adolescent to be cared for outside a paediatric ward for example in an intensive care unit, maternity unit (for the purposes of delivering), or a mental health unit, they must be in a paediatric safe bed (see Section 3.2).

In all exceptional circumstances a decision about where to admit the patient must be made by the paediatrician or senior clinician, be documented in the clinical notes, and reviewed for safety factors within 24 hours.

To protect children and adolescents from unwanted exposure, including casual overlooking and overhearing:

- children/adolescents must have separate bathrooms (no shared bathroom facilities with adults)
- adult patients must not pass through areas caring for children to reach their own facilities
- children/adolescents must not be required to pass through an adult ward or unit to access facilities
- appropriate security measures must be installed where appropriate, for example secure doors with swipe card access.

3.4 Child Protection

NSW Hospitals must undertake mandatory child related screening of employees and ensure all staff who care for children and adolescents receive education and training about the protection of children and adolescents.

NSW Hospitals must ensure that all staff are aware of and comply with their responsibility to protect the health, safety and wellbeing of children and adolescents as outlined in the Child Wellbeing and Child Protection Policies and Procedures for NSW Health.

NSW Health staff must follow the Child Wellbeing and Child Protection Policies and Procedures for NSW Health. This includes:

- use of the decision tree in the Mandatory Reporters Guide (MRG) to decide when to report and what to report in relation to child protection concerns
- consultation with the NSW Health Child Wellbeing Unit mandatory reporting
- documentation and information exchange as per the Child Wellbeing and Child Protection Policies and Procedures for NSW Health.

Chapter 16A of the Children and Young Persons (Care and Protection) Act

3.5 Children or Adolescents under Assumption of Care Orders

Where the Department of Communities and Justice (DCJ) have assumed care responsibility of a child or adolescent in accordance with the Children and Young Persons (Care and Protection) Act 1988 and they are in a NSW Hospital, the Hospital must comply with the child wellbeing and child protection procedures for NSW Health. Section 9.9 *Assumption of Care Responsibility of a Child or Young Person by Community Services on Health Premises.*

Suggested reading

NSW Health Policy Directive *Child Wellbeing and Child Protection Policies and Procedures for NSW Health* (PD2013_007)

3.6 Children and Adolescents leaving the ward or being discharged from hospital

NSW Hospitals must have systems in place to ensure that when children and adolescents leave a ward or unit that they are accompanied by an appropriate parent/carer, and that their whereabouts (including time of departure and return) is known and documented.

Systems must also be in place to ensure that when children and adolescents are discharged from hospital that they are accompanied by an appropriate parent/carer.

3.7 Management of Violence and Aggression

NSW Health facilities must maintain a zero-tolerance approach to violence and establish work systems and environments that enable, facilitate and support the zero-tolerance approach.

This includes a zero-tolerance approach to violence perpetrated by patients and others against staff, patients or visitors. Hospital managers must exercise their responsibilities in relation to preventing and managing violence, in line with NSW Health Policy Directive *Preventing and Managing Violence in the NSW Health Workplace – A Zero Tolerance Approach* (PD2015_001).

As part of the ongoing management of work health and safety risks, all NSW Hospitals must have in place a violence prevention program that focuses on the elimination of violence related risks.

3.8 Children and adolescents with acute behavioural or mental health problems

NSW Hospitals admitting children and adolescents for acute mental health care must comply with the NSW Health Policy Directive *Children and Adolescents with Mental Health Problems Requiring Inpatient Care* (PD2011_016) and the Mental Health Act 2007.

NSW Hospitals must:

- apply the principle of least restrictive care
- maximise the child or adolescent's choices, rights and freedom as much as possible whilst balancing safety (people accessing services, staff and others) and health care needs
- ensure consultation with an appropriate clinician if assessment and management is required
- ensure staff providing care have the appropriate knowledge, skills and capabilities to work with children and adolescents with acute behavioural or mental health issues. This includes completion of all mandatory training required to work with people experiencing mental health problems.

NSW EDs must have a Safe Assessment Room – a clinical area designed to accommodate the needs of patients with, or at risk of developing Acute Severe Behavioural Disturbance (ASBD), who require assessment in a therapeutically supportive environment.

Seclusion and restraint must only be considered as a last resort after less restrictive alternatives have been trialled or considered and the safety of staff must be maintained at all times in accordance with NSW Health Policy Directive *Seclusion and Restraint in NSW Health Settings* (PD2020_004).

Suggested links and reading

NSW Health Guideline *Management of patients with Acute Severe Behavioural Disturbance in Emergency Department* (GL2015_007)

Provision of Trauma Informed Care

3.9 Facilities for parents and carers

Facilities for parents/carers to stay nearby to their child or adolescent must be provided, for example a lounge chair or folding bed in the ward or unit or a chair in ED. Allowing parents/carers to stay with their child or adolescent in hospital has a positive impact on the child and parent/carer stress and increases the child or adolescent's coping ability.

NSW Hospitals must:

- make it possible for a parent/carer to always remain with their child or adolescent. The only circumstance in which this does not apply is for exceptional cases where the adolescent states they do not want their parent/carer to remain with them. In such cases a decision must be documented in the clinical notes and regularly reviewed with the adolescent.
- Provide amenities to facilitate the comfortable stay of parents/carers at the child or adolescent's bedside.
- Facilitate culturally appropriate arrangements to support Aboriginal children and adolescents.
- Orientate parents/carers to the relevant areas within the facility and relevant practices to enable them to safely assist with the basic care needs of their child/adolescent.
- Notify parents/carers of any pending transfer arrangements for their child/adolescent.
- Ensure that parents/carers of children and adolescents requiring surgery are able to accompany their child/adolescent to the operating theatre and have access to the recovery room.
- Ensure parents/carers are able to be present at the induction of anaesthesia for children and adolescents, and allowed into recovery as soon as possible.

Additional facilities for the parents/carers that must be provided are:

- facilities for nutrition, such as a kitchenette with fridge and microwave
- facilities for breastfeeding and for breast milk storage
- access to amenities such as a shower, toilet and washing facilities.

Suggested links and reading

NSW Health Guideline *Safe Assessment Rooms* (GL2020_001)
Australian Commission on Safety and Quality in Health Care, National Safety and Quality Health Service (NSQHS) Standards User guide for acute and community health services organisations that provide care for children

3.10 Gender Specific Accommodation

The needs and preferences of adolescent patients must be sought, recorded and respected, regardless of their sexuality, gender identity or intersex variations.

Bathroom facilities do not need to be designated as gender specific as long as they accommodate only one patient at a time and can be locked by the patient (with an external override for emergency use only).

Parents/carers accompanying children must use adult visitor bathroom facilities, except where their child or adolescent is in a single room with an en-suite bathroom.

Suggested reading

NSW LGBTIQ+ Health Strategy 2022-2027, Implementation Plan 2022-2027 and Summary of Evidence

3.11 Safe and Appropriate Transfers

NSW Hospitals must ensure the safe and timely transfer of children and adolescents whose medical condition requires care at a different level from that of the presenting hospital in line with NSW Health Policy Directive *Children and Adolescents – Inter-Facility Transfers* (PD2010_031).

When transporting children and adolescents around the hospital they must not be left unattended at any time. If the child or adolescent is acutely unwell or post-operative an appropriate clinical escort must be provided.

3.12 Transition of care

Health services must have a formal transition process in place to transition adolescents to adult services, in line with the principles outlined within Key Principles for Transition of Young People from Paediatric to Adult Health Care.

Facilities that manage children and adolescents with chronic conditions must identify a person within the patient's clinical team to act as a transition coordinator/facilitator. This person may be any member of the multidisciplinary team.

Their role is to identify children and adolescents, ensure that they receive education packages and are referred to appropriate services such as Trapeze and ACI Transitional Care Coordinators.

GUIDELINES FOR HOSPITALS AND MATERNITY STAFF IN THEIR RESPONSE TO PARENTS CONSIDERING THE ADOPTION OF THEIR CHILD (PD2005_545)

PD2005_545 supersedes circulars 82/296 and 82/297, Health Commission Policy on Adoption.

This is a circular for the NSW Health system that outlines principles and guidelines for hospitals and maternity staff in their response to parents considering the adoption of their child. These guidelines are being issued to ensure that current legislation is complied with and contemporary good practice principles are followed.

Local policies and protocols of public health organisations should be updated to reflect these guidelines. These guidelines are also recommended to private health care facilities for general use as a standard of good practice.

These guidelines are particularly relevant to and should be specifically noted by the following NSW Health staff:

Maternity services - nursing, medical and allied health staff;
Paediatricians and Paediatric Registrars;
Hospital Social Workers;
Medical Records Staff to note section 3.7 of the Guidelines.

The NSW Department of Community Services is currently preparing new adoption legislation which will repeal, replace and consolidate the *Adoption of Children Act 1965* and the *Adoption Information Act 1990*. In addition, it is anticipated that the new *Children and Young Persons (Care and Protection) Act 1998* will be proclaimed in the second half of 2000, and will replace the *Children (Care and Protection) Act 1987*. This circular has been written to reflect the directions of this new legislation. Following the proclamation of these new Acts this circular will be reviewed and updated.

GUIDELINES FOR HOSPITALS AND MATERNITY STAFF IN THEIR RESPONSE TO PARENTS CONSIDERING THE ADOPTION OF THEIR CHILD

1. PRINCIPLES

1.1 Parents considering offering their expected or newly born child for adoption, should be accorded and advised of the same rights, privileges, responsibilities, treatment/s, information and support services as any other parent in the hospital. Parents should be cared for with sensitivity and in a non-judgemental manner.

1.2 As adoption severs a child's legal relationship with his/her family of birth, it is important that parents are informed of all alternative care options for their child and are assisted to consider these options. Adoption is one of the placement options for parents who do not wish or are unable to care for their child. It is the most radical form of substitute care for a child.

1.3 Parental choice throughout the process is to be respected. Parents should at all times be the ones to make the decisions about contact with, feeding and care of the baby. The decisions of the parent/s may change over time. For example, the decision to adopt is not always made antenatally, or if considered antenatally may change following birth of the baby. It is also useful to recognise that at any one point in time a parent may be ambivalent about adoption, that is have diverse feelings simultaneously.

1.4 The rights of both the child's parents to participate in decisions concerning the child should be taken into account.

1.5 Parental wishes for confidentiality regarding a decision about adoption of their child are to be respected by health professionals.

1.6 Parents are the legal guardians of their child, unless a Court has removed their parental responsibilities or made them joint guardians with a third party. Consent to medical treatment for the child is to be given by the child's legal guardian. NSW Health PD2005_406 department's policies in relation to consent to medical treatment and the provision of information to patients.

1.7 The parents of the child have the right to name the child. The name given to the child by the parents is the child's legal name and should be used to identify the child. However, that name may be changed by legal processes.

1.8 Unless specified in the medical report form required by the *Adoption of Children Act 1965*, a baby for adoption does not require any specific tests as a result of the adoptive process. The baby should receive the routine screening tests and any other that are medically indicated.

1.9 The loss experienced by parents through the adoption of a child may be profound and lifelong. Feelings of grief and loss may be accompanied by significant distress. Affected parents should be offered appropriate support and comfort. Follow-up counselling should be offered for persistent or severe distress or those at highest risk (eg poor social support, a history of significant losses or mental health problems) with identified pathways to specialist mental health care if required.

2. DEPARTMENTAL ROLES AND RESPONSIBILITIES

2.1 NSW Health System

2.1.1 The role of NSW Health staff is to ensure that the health needs of mother and baby are met. The aim is to ensure the best physical and emotional health outcome for the family. NSW Health staff also provide health care and assessment of the child. Information about the child is provided to the Department of Community Services or licensed private adoption agency.

2.1.2 While the mother and baby are the primary focus of the maternity service, the role of the father and extended family is also to be acknowledged and accommodated in the provision of care and support.

2.1.3 The NSW Health system has no role in arranging adoption or witnessing adoption consent.

2.2 Department of Community Services and licensed private adoption agencies

2.2.1 The Department of Community Services and the licensed private adoption agencies are the only bodies authorised to make adoption arrangements.

Making adoption arrangements involves:

- counselling which will include assisting the parents to explore their reasons for considering adoption, explaining alternatives to adoption and ensuring their understanding of the effects of an adoption order;
- witnessing consent;
- preparing the adoption plan;
- placement of the child;

and, facilitating the appropriate provision of:

- ongoing counselling and support for parent/s following consent;
- follow up for grief and loss issues of the parent/s and family.

2.2.2 Once all required consents to the child's adoption have been given by the parent/s, or dispensed with by the Court, the Director-General of the Department of Community Services becomes the legal guardian of the child. This includes cases where the adoption arrangements are being made by a private licensed adoption agency.

2.2.3 The Department of Community Services and the licensed private adoption agencies can make arrangements for the temporary care of the child. Temporary care is usually arranged with the consent of the parents, who are encouraged to maintain regular contact with the child. For most infants the period of temporary care is likely to be of only several weeks duration to enable the parents to resolve their situation.

2.2.4 The maximum period usually available for temporary care is 6 months. The temporary care arrangement may be terminated at any time by the parents or the agency that made the arrangement (the Department of Community Services or the licensed private adoption agency, as the case may be).

3. LEGISLATIVE FRAMEWORK

3.1 General

3.1.1 Adoption practice is principally governed by the *Adoption of Children Act 1965* (ACA), the *Adoption Information Act 1990* (AIA), some sections of the *Children (Care and Protection) Act 1987* (CC&PA), and their respective Regulations.

3.1.2 The NSW Department of Community Services is currently preparing new adoption legislation which will repeal, replace and consolidate the *Adoption of Children Act 1965* and the *Adoption Information Act 1990*. In addition, it is anticipated that the new *Children and Young Persons (Care and Protection) Act 1998* will be proclaimed in the second half of 2000, and will replace the *Children (Care and Protection) Act 1987*.

3.1.3 Parents are the legal guardians of their child, unless a Court has removed their parental responsibilities or made them joint guardians with a third party. The Director-General of the Department of Community Services becomes the child's exclusive guardian under the adoption process when all consents to the child's adoption by a parent or guardian have been given or dispensed with by the Supreme Court.

3.2 Adoption

3.2.1 Adoption is a legal process which ends the legal relationship and responsibilities between the child and his/her parents and establishes a new legal relationship and responsibilities with the adoptive parents. (Section 35 ACA)

3.2.2 Adoptive placements of non-related children can only be arranged by the Department of Community Services or a licensed private adoption agency. Any other adoptive placement of a child with a non-related person is an unauthorised adoption placement and in breach of the Act. (Section 51 ACA)

3.2.3 Relative is defined in the adoption law as the grandparent, uncle or aunt of the child, whether by blood, adoption or marriage. (Section 6 ACA)

3.2.4 Once all required consents to the adoption have been given by the parents or guardians of the child, or dispensed with by the Supreme Court, the Director-General of the Department of Community Services becomes the exclusive guardian of the child and remains exclusive guardian until:

- the making of the adoption order or an order in lieu of adoption;
- the adoption consent(s) are revoked; or
- the Director-General terminates the arrangement, including the return of the child to the parents (Section 34 ACA);
- the Supreme Court makes an interim order that the child become a ward of the Minister (Section 34(4) ACA).

3.2.5 Adoption orders are made through the NSW Supreme Court.

3.3 Adoption Consent

3.3.1 The Department of Community Services or the licensed private adoption agency is responsible for making the arrangements for a qualified person, under the legislation, to witness the adoption consent.

3.3.2 For the mother of a child, consent to adoption may legally be given at any time on or after the fifth day of the child's birth. (Section 31 (2) ACA)

- for many women the consent to adoption is given at a time well beyond this minimum period;
- a mother may be discharged from hospital without her child when she is ready/medically fit, without signing an adoption consent.

3.3.3 The father of a child can give his consent at any time after the child's birth.

a) The legislative provisions relating to the involvement of a child's father in the adoption decision are complicated. Men who acknowledge their paternity should be accorded the right to be involved in decisions concerning their child, including the adoption decision. (*The Status of Children Act 1996*, Sections 26 and 31A ACA)

b) Clarification of the adoption consent requirements in respect of fathers should be sought from the Department of Community Services or the licensed private adoption agency. A father's consent to his child's adoption is definitely required if:

- the child was born of his marriage; or
- the child was born of his defacto relationship and the child is part of the household; or
- **the father has been appointed a guardian by a court and has custody of the child.**

3.3.4 For adoption consent to be valid and legal (Sections 29 & 31 ACA, Regulations 21-24):

a) It must not have been obtained by fraud, duress or other improper means.

b) The parent must understand the nature of the consent and be in a fit condition to give consent. For example: the parent should not be ill, receiving medication or treatment that could affect decision processes, or suffering an acute psychiatric condition.

c) When medical certification of the mother's fitness to consent is provided, consent to adoption can legally be given by a mother before the fifth day of the child's life. However this situation is highly unusual. Adoption consent cannot be signed before the birth of the child.

d) Consent must be given on the prescribed form and attested to by a qualified witness. Only certain categories of people are qualified in the *Adoption of Children Regulation* to witness a consent.

e) The qualified witness has certain obligations to fulfil under the Regulations before the parent can sign the consent. These are:

- to be satisfied of the identity of the person giving consent;
- **to ensure the parent received, at least 72 hours before signing consent, written information about the effect of giving consent and the rights of the parties concerned in an adoption;**
- to afford the parent ample opportunity to read the consent documents;
- to be satisfied the parent understands the effect of signing the consent; and
- if the parent is under the age of 16, before consent is given, a report of a registered psychologist, or other appropriate expert, is required of the capacity of the parent to understand the effect of signing an adoption consent.

3.3.5 Following consent, the period for a parent to revoke or withdraw their consent is 30 days. (Section 28 ACA)

a) Consent is revoked by the parent notifying in writing the Deputy Registrar of the NSW Supreme Court of their intention to revoke their consent.

b) A form for revocation is included in the parent's consent documents.

c) The Department of Community Services or the licensed private adoption agency will notify the parent of the impending expiry of the revocation period at least 7 days before its expiry. (ACA Regulation 26)

d) On revocation, the parent resumes their guardianship of the child.

e) If a parent has revoked their consent, but is unable to resume the care of their child, a temporary care agreement will need to be signed while the parent considers the child's future.

3.4 Leaving Hospital

3.4.1 Under Section 27 (2) of the *Children (Care and Protection) Act 1987* it is an offence for a person to permit a child, unless s/he is in the care of his/her mother, to be taken from hospital without the consent of the Director-General.

3.4.2 When the child is ready to leave hospital, if a parent is unable to care for the child and has not signed the adoption consent, temporary care arrangements should be made for the child by the Department of Community Services/licensed private adoption agency. The parent/s will be asked to sign a Temporary Care Agreement with the Department of Community Services or enter into a private fostering arrangement with a licensed foster care or private adoption agency.

3.4.3 If the parent/s have not signed adoption consent, do not agree to sign a temporary care arrangement and are unwilling to resume the care of the child, the child should be notified to the local office of the Department of Community Services.

3.4.4 Where the child is to be discharged to the care of a Department of Community Services temporary foster carer, the carer must provide the hospital with a letter containing the consent of the Director-General of the Department of Community Services to their care of the child and show identification. The letter and copy of the identification are to be placed on the child's hospital record.

3.4.5 Where a child is to be discharged to the care of a licensed private adoption agency carer, the carer must provide the hospital with a letter signed by the Principal Officer of the agency and show identification. The letter and copy of the identification are to be placed on the child's hospital record.

3.5 Contact

3.5.1 The adoption legislation does not place any statutory restrictions on the degree of contact a parent may have with their child in hospital.

3.5.2 As a general rule, prior to adoption consent the child's parent/s decide on the level of contact they wish with the child, whether the child is to room in with the mother, or be cared for in the nursery etc. However, if an assessment of risk for the child has led to the Department of Community Services assuming the care of the child under the *Children (Care and Protection) Act* (Section 62A), the level of contact should be determined by the Department of Community Services.

3.5.3 Once all required adoption consents have been given, because the guardianship of the child has changed, the level of contact should be negotiated between the parent/s, Department of Community Services/licensed private adoption agency and the hospital.

3.6 Registering the birth and naming the child

3.6.1 The *Births, Deaths and Marriages Registration Act* requires a parent to notify the Registry of the birth of a child within a month of the birth. Where the parents are not married to each other, the father's details can only be included on the registration if both parents sign the information form. Both parents should be encouraged to record their names.

3.6.2 If the child is subsequently adopted, this acknowledgment of a man's paternity will affect the rights of the adopted person and the father under the *Adoption Information Act 1990*. Acknowledgment of a man's paternity will allow the adoptee to receive identifying information about his/her father and the father will be able to access identifying information about the child.

3.6.3 The name given to the child by the parents is the child's legal name (unless changed as a result of an adoption order) and should be used to identify the child.

3.7 Records

3.7.1 The *Adoption Information Act 1990* (AIA) gives adopted persons, their birth parents and adoptive parents the right to certain information about themselves and each other. This includes their access to medical and social work records. The information that can be accessed is prescribed by the AIA.

3.7.2 Access by an adopted person to records related to his/her birth parent require the person to present a 'Supply Authority' from the Department of Community Services or a copy of their original birth certificate released under the AIA prior to June 1998.

3.7.3 Similarly a birth parent cannot access information from an adopted child's records without the appropriate authority.

3.7.4 Since the NSW *Archives Act 1960*, adoption records have been retained in the State Archives in perpetuity.

3.7.5 NSW Health PD2010_050, *Adoption Act 2000* - Release of Information, outlines guidelines to be followed in respect of adoption related enquiries to public hospitals.

4. HOSPITAL PRACTICE

4.1 Antenatal care

4.1.1 If adoption is being considered, the maternity/hospital social worker would normally be involved in the management and care of the woman. A referral to a social worker should be made following discussion and agreement by the woman/couple.

4.1.2 Information, education, support and counselling should occur regarding the birth plan and birthing process. A birth plan should be agreed so that the hospital is able to offer appropriate care. The birth plan is to include:

- the wishes of the parent/s regarding their involvement with the baby after delivery;
- who else is to be involved, eg the grandparents of the baby and other support people;
- how much contact they will have with the baby;
- memorabilia of the baby that may be wanted by the parents, eg photographs, hand/foot prints, cot cards, identification bands, the Blue Book.

4.2 Birth

4.2.1 Antenatal staff are to ensure the appropriate transfer of information to the delivery suite and postnatal ward to ensure that appropriate care in line with the wishes of the parent/s is provided. Confirmation of the birth plan is to occur, along with reassurance to the woman/ couple that they are able to alter the birth plan at any time so that their needs are met.

4.2.2 At delivery there should be no obstacle to the parent/s being shown or handling their child should they wish to do so, providing this is medically feasible.

4.2.3 Following the birth, the midwife usually informs the maternity/hospital social worker (if involved) that the baby has been delivered. The decision and timing of notification of the birth to the adoption agency is made by the parent/s who may wish to consult with and seek the assistance of the hospital social worker.

4.2.4 If no prior discussion has occurred between hospital staff and the woman/couple and adoption is discussed at this point in care (ie birth/postnatal) a referral to the maternity/hospital social worker should be made as soon as possible.

4.3 Consent to medical treatment of the child

4.3.1 Generally, the parent/s are the legal guardian/s of the child, parental consent to medical treatment or a Court order is required. However, in an emergency, medical practitioners may act without the consent of a parent or guardian (Section 20A, *Children (Care and Protection) Act 1987*).

4.3.2 If there is an arrangement in place for temporary care, consent to medical treatment may be provided by the Department of Community Services or the licensed private adoption agency as the case may be, if the consent of the parent/s is unable to be obtained (the Department of Community Services or licensed private adoption agency will obtain parental consent where possible).

4.3.3 If the Director-General of the Department of Community Services has become the child's legal guardian, consent to medical treatment is required from the Department of Community Services.

4.4 Postnatal care

4.4.1 The parent/s choose where the baby is to be cared for following the birth, that is rooming in with the mother or cared for in the nursery. The parent/s choose the degree of contact they have with the baby and whether the baby is breastfed.

4.4.2 If an assessment of risk for the child has led to the Department of Community Services assuming the care of the child under section 62A of the *Children (Care and Protection) Act 1987*, postnatal care of the child and the degree of contact between the child and the parent/s should be determined by the Department of Community Services.

4.4.3 The parent/s have the right to name the child and are responsible for completing the birth registration form. The baby is to be identified at all times by the name given by the parent/s.

4.5 Mementos

4.5.1 Having first obtained the permission of the parent/s, two sets of mementos of the baby such as photographs, hand/foot prints of the baby, cot cards, identification bands should be gathered and two Blue Books (Personal Health Records) issued.

4.5.2 Mementos of the baby and the Blue Book should be offered to the parent/s. If the parent/s do not want to take these mementos at this time, permission from the parent/s should be requested for the mementos to be forwarded the Department of Community Services/licensed private adoption agency to be held on file for the parent/s if requested in the future.

4.5.3 It is usual practice for the Department of Community Services/licensed private adoption agency to request mementos on behalf of the child. A set of these items is to be gathered for the child and forwarded to the Department of Community Services/licensed private adoption agency on request. Hospital staff should explain to the parents that these items are given to the adoptive parents to provide the child with mementos of his/her birth.

4.5.4 No identifying details other than the baby's first name should appear on the set of mementos and Blue Book provided to the adoptive parent of the child.

4.6 Discharge

4.6.1 Temporary Foster Care

4.6.1.1 The baby should leave the hospital for temporary foster care as early as practicable. The Department of Community Services or licensed private adoption agency arranges the temporary foster care and ongoing access of the parent/s to the child in consultation with the parent/s.

4.6.1.2 The Nurse Unit Manager or delegate is to be advised by the Department of Community Services/licensed private adoption agency when the foster parents will be coming to collect the baby. The Department of Community Services or licensed private adoption agency provide the foster parents with a letter giving consent for the child to be discharged into their care. Identification should also be provided by the foster parents. This letter and a copy of the identification is to be placed in the child's hospital record.

4.6.2 Medical Report Forms

4.6.2.1 There are two statutory medical reports to be completed on a child to be placed for adoption (Clause 19 *Adoption of Children Act Regulation*). These are *Medical Report following Birth of a Child* and *Medical Report on Child*. These forms are to be completed by the relevant medical officer prior to discharge and forwarded to the Department of Community Services or licensed private adoption agency. Copies of the medical report forms are attached.

4.6.2.2 Before a child's discharge from hospital, it is helpful for the relevant medical officer to provide a referral to an appropriate medical practitioner for ongoing medical examination and care of the child. This will assist the Department of Community Services or licensed private adoption agency to comply with the relevant Regulation in regard to ongoing medical care.

4.6.3 Discharge Planning

4.6.3.1 Prior to the child's discharge from the hospital, the foster parent/s are to be advised by hospital staff of their local Early Childhood Health Service and encouraged to access this service while the child is in their care.

4.6.3.2 Discharge planning should also address the health needs of the parent/s, including the physical and mental health needs. The maternity/hospital social worker may remain available to the parent/s and their family following discharge for follow up consultation. Other options for ongoing support should be identified in consultation with the adoption agency. Parent/s who are severely affected by loss may be vulnerable to (postnatal) depression and may require specific follow-up to monitor their mental health with access to appropriate treatment, if necessary.

4.6.3.3 Hospital staff should ensure that the mother is given appropriate advice and information on all aspects of the postnatal period - physiological and emotional. As well as social work support this should include:

- information and explanation about normal and abnormal physiological processes after child birth;
- an offer of domiciliary midwifery visits after discharge;
- information on who to contact if problems arise;
- information on the importance of arranging a 6 week postnatal visit.

5. ADOPTION SERVICES

A parent considering the adoption of their child may be referred for information about adoption and counselling to the NSW Department of Community Services or one of the private adoption agencies licensed to make arrangements for an infant's adoption.

The contact details for these agencies are:

Adoption and Permanent Care Section
Adoption Services Branch
NSW Department of Community Services
Level 13, 130 George Street
Parramatta NSW 2150
Telephone: 9865 5900, 9865 5911, 9865 5966, 9865 5974, 9865 5992.
Website: http://www.community.nsw.gov.au
Email**:** adoption@community.nsw.gov.au

Anglicare Adoption Services
19A Gibbons Street
Telopea NSW 2117
Telephone: 9890 6855
Facsimile: 9890 6899
Email: adoptions@anglicare.org.au

Centacare Adoption Services
9 Alexandra Avenue
Croydon NSW 2132
Telephone: 9745 3133
Facsimile: 9744 7123
Email: adoption@centacare.aust.com

Barnardos Find-a-Family Program is also a licensed private adoption agency, however provides services to children over the age of 2 requiring adoptive placement.

These organisations also have information, pamphlets and resources on adoption.

6. MEDICAL FORMS

Copies of the two statutory medical reports to be completed on a child to be placed for adoption (Clause 19 *Adoption of Children Act Regulation*) are attached:

- Medical Report following Birth of a Child
- Medical Report on a Child

ADOPTION OF CHILDREN ACT 1965
REGULATION 29 (1)

Medical Report Following Birth of Child

NAME OF CHILD: _____
Sex: _____

Date of child's birth: _____
Time of birth: _____

Place of child's birth: _____

Birth Weight: _____
Length at birth: _____

Head circumference at birth: _____

Evidence of developmental defect, injury, infection or other disability: _____

APGAR RATING: (see overleaf)

	Score	Code		
Heart rate		A - 9 to 10		(A
Respiratory effort		B - 7 to 8		(B
Muscle tone		C - 5 to 6	This baby is	(C
Colour of infant		D - 3 to 4		(D
Reflex irritability		E - 0 to 2		(E
Total				

MOTHER'S NAME: _____

Age: _____

Parity: _____

Height: _____

Ethnic group: _____

Serological tests for syphilis done on the mother in puerperium: _____

2. PAEDIATRICS **2.88**

Result: _____

_____

Details of labour and delivery:

_____

_____

GENERAL COMMENT: (The examiner's assessment of the child's physical status)

_____

_____

_____

Name and address of doctor: _____

Date of examination: _____

Signature: _____

APGAR RATING -- at one minute

Estimated exactly 1 minute after birth -- preferably by 2 observers:

HEART RATE = 0 = 1 = 2 0 = No beat seen, felt or heard 1 = Rate of under 100 2 = Rate 100-140		A heart rate of 100-140 is considered good and given a score of two, a rate of under 100 receives a score of one, and if no heartbeat is seen, felt or heard, the score is zero.
RESPIRATORY EFFORT = 0 = 1 = 2 0 = Apnoeic at 60 secs. (including one or more gasps, then apnoea) 1 = Irregular shallow ventilation 2 = Breathed and cried lustily		An infant who is apnoeic at 60 seconds after birth receives a score of zero, while one who breathes and cries lustily receives a two rating. All other types of respiratory effort, such as irregular, shallow ventilation are scored one. An infant who has gasped once at thirty or forty-five seconds after birth and who then becomes apnoeic, receives a zero score, since he is apnoeic at the time decided upon for evaluation.
MUSCLE TONE = 0 = 1 = 2 0 = Completely flaccid 1 = Poor tone 2 = Good tone, spontaneously flexed arms and legs		A completely flaccid infant receives a zero score and one with good tone and spontaneously flexed arms and legs, which resist extension, is rated two points.
COLOUR = 0 = 1 = 2 0 = Cyanosed deeply 1 = Slightly cyanosed 2 = Entire child pink		A score to two is given only when the entire child is pink.
REFLEX IRRITABILITY = 0 = 1 = 2 0 = No response 1 = Feeble cry 2 = Vigorous cry		Response to external stimuli-lactile or thermal.

ADOPTION OF CHILDREN ACT 1965
REGULATION 29 (1)

Medical Report on Child

(To be made wherever possible by a Paediatrician but where necessary by other examining medical practitioner.)

Note for the Guidance of Examining Doctor:

The examination is intended to provide a record, available to the adoptive parents, of the child's apparent mental and physical condition so that information which would have been available to them as natural parents and which may be of importance for the future welfare of the child, so far as practicable will be available. The doctor is not asked to give his opinion as to the suitability of the child for adoption.

NAME OF CHILD: _____
Sex: _____

Date of Birth: _____
Estimated Gestation: _____

Present Weight: _____
Present Length: _____

Present head circumference: _____

BEHAVIOUR: Startle reflex: _____

General activity and vigour: _____

Capacity to take feedings: _____

Abnormal behaviour or posture: _____

EVIDENCE OF DEVELOPMENTAL DEFECT, INJURY, INFECTION OR OTHER DISABILITY:*

_____
_____
_____
_____

LABORATORY DATA

(H.B. Film _____
Blood (
(Serological Tests for Syphilis _____

(Reducing substances _____

(Phenyl Pyruvic Acid (or Guthrie Blood Test) _____

_____

GENERAL COMMENT: (The examiner's assessment of the child's physical status and behaviour)

_____

_____

_____

_____

_____

_____

Name and address of doctor: _____

Date of examination: _____

Signature: _____

_____

* The examination should include, if applicable, inter alia:

<u>At any age</u>

Capacity of infant to focus eyes on object held about 30 cms. from face and moved from side to side.
Squint. Visual activity. Nystaginus. Cataract. Retinopathy.
Mouth and Palate.
Hearing Bell. Watch. Human voice/whisper. If deaf - probable cause.
Evidence of developing head control. Size and tension of fontanelle.
Co-ordination. Laterality (Dominance). Posture. Tone. Congenital dislocation of hip. Talipes.
Descent of testes. Hernia. Naevi. Abdominal tumour or enlargement or organs.
Pyspnoea. Stridor. Productive cough. Asthma.
Evidence of Mongolian defect.
Pubescence, Menstruation.
Central or peripheral Cyanosis. Heart murmur or abnormal rhythm. Femoral pulse.

<u>Additional matters in respect of child over three months of age:</u>

Capacity to respond to invitation to smile; to follow movement of examiner; to grasp and hold rattle etc. Excessive rhythmical activity (e.g. head rolling, banging). Developing power to maintain sitting posture, with support.

MATERNITY - MATERNAL GROUP B STREPTOCOCCUS (GBS) AND THE MINIMISATION OF NEONATAL EARLY - ONSET GBS SEPSIS (GL2017_002)

GL2017_002 rescinds GL2016_021, PD2005_240

PURPOSE

This Guideline provides guidance for two standard approaches used to identify women for whom intrapartum antibiotic prophylaxis (IAP) should be offered to reduce the risk of intrapartum transmission of Group B Streptococcus (GBS) to the neonate and minimise the risk of early-onset Group B Streptococcus (EOGBS) sepsis.

KEY PRINCIPLES

This Guideline provides Local Health Districts (LHD) with current, evidenced-based information to facilitate LHDs to ensure:

- Women are identified for whom intrapartum antibiotic prophylaxis (IAP) should be offered to reduce the risk of intrapartum transmission of GBS to the neonate and minimise the risk of EOGBS
- Appropriate assessment, detection, and escalation of neonates at risk of, or exhibiting signs and symptoms of EOGBS which occurs in the first 0 - 7 days following birth
- The importance of information and support for maternal choice is acknowledged.

USE OF THE GUIDELINE

The Chief Executives of NSW LHDs are responsible to:

- Select either a routine antenatal culture-based approach or a risk factor-based approach
- Ensure the development and implementation of local protocols or operating procedures in line with the approach chosen across all maternity facilities offering maternity services
- Ensure the chosen approach is consistently applied and neonatal morbidity and mortality associated with EOGBS sepsis is monitored and reviewed as per NSW Health PD2011_076 *Deaths - Review and Reporting of Perinatal Deaths* and NSW Health Policy Directive PD2009_003 *Maternity - Clinical Risk Management Program.*

The guideline can be downloaded here:-
Maternity - Maternal Group B Streptococcus (GBS) and minimisation of neonatal early-onset GBS sepsis

NSW PAEDIATRIC CLINICAL CARE AND INTER-HOSPITAL TRANSFER ARRANGEMENTS (PD2023_019)

PD2023_019 replaced PD2010_030 and PD2010_031

POLICY STATEMENT

NSW Health is committed to providing the right care, in the right place, at the right time and as close to home as possible. Many infants, children and adolescents will be able to receive the clinical care they need at a local service. If their needs are outside a service's capability and capacity to deliver the required care, an inter-hospital transfer must be arranged.

SUMMARY OF POLICY REQUIREMENTS

To provide appropriate clinical care and inter-hospital transfers for paediatric patients, NSW Health services must operate at their designated service capability level within agreed local health service arrangements and in partnership with transport and retrieval services. NSW Health services may also have local arrangements in place for paediatric inter-hospital transfers with specialist health services and retrieval services in bordering jurisdictions.

NSW Health organisations are to develop local guidance in line with this Policy Directive. This guidance must outline local arrangements for services (including Multipurpose Services) to follow when accessing clinical consultation to support care delivered locally as well as care involving inter-hospital transfer. Inter-hospital transfer processes are to include escalation of care to higher-level services and return transfer close to home when medically appropriate.

All services must work together to provide a network of care for NSW paediatric patients. Within local arrangements, higher-level services are responsible for providing lower-level services with support, advice and management of paediatric patients, including patients requiring inter-hospital transfer.

As supra-Local Health District services, Level 5 and 6 neonatal and Level 6 paediatric services must provide services for paediatric patients located within NSW and the ACT.

When an inter-hospital transfer is being considered, clinical decision-making must primarily match the paediatric patient's condition to the most appropriate service and consider:

- service capability and capacity of referring and receiving services
- capability and capacity of transport and retrieval services
- providing care as close to home as possible
- child and adolescent and family needs and preferences
- logistics such as weather and modes of transport.

Transfer decisions are to be made through discussion between responsible clinicians at the referring and receiving services. The Newborn and paediatric Emergency Transport Service (NETS) must be involved when an immediate response for transfer is needed and when clinical escort decisions require additional specialist clinical advice. NETS will facilitate care plan decision-making for these transfers through hosting conference calls with all clinical decision-makers.

Retrieval teams are responsible for the clinical care of a patient from the time of handover from the referring treating team until the patient is handed over to the destination service.

If an infant, child or adolescent in a hospital close to the border with an adjoining state requires a cross-border inter-hospital transfer, NETS will arrange transport or retrieval via NETS or NSW Ambulance or request the relevant jurisdiction's retrieval service to respond.

If a bordering jurisdiction's retrieval team is conducting the transfer, NETS will maintain contact with the referring treating team and provide clinical leadership until NETS confirms that the bordering retrieval team has taken over direct patient care. On handover, governance of the transport process moves to the bordering jurisdiction's transport/ retrieval service.

Management of urgency and risk are shared responsibilities of all parties involved in the transfer.

When transfer to higher-level care is required, the patient is to be appropriately transported within the medically agreed time frame to the nearest service that can provide the needed care. Treating teams at higher-level services are responsible for accepting referrals or finding an appropriate alternative if they do not have capacity to provide the needed care.

For return transfers, destination planning (identification of most appropriate service and bed-finding) is led by referring services and must be assisted by higher-level services if required.

Local health districts and the Sydney Children's Hospitals Network will optimise access to appropriate care close to home through services operating at their designated service capability level and actively managing patient flow.
Infants, children, adolescents and their families/carers are to be provided with timely, culturally appropriate and accessible information about clinical care, decisions and the transfer process.

A family member/ carer must be supported to travel with their child during an inter-hospital transfer wherever possible and appropriate, in consultation with the transport/ retrieval service.

Infants, children, adolescents and their families/ carers are to be offered relevant services and supports including through Aboriginal health workers, Aboriginal Maternal and Infant Health Service (AMIHS) staff, interpreters, cultural and diversity supports, social workers and other services as required.

The NSW Paediatric Clinical Care and Inter-Hospital Transfer Arrangements policy is available at: https://www1.health.nsw.gov.au/pds/Pages/doc.aspx?dn=PD2023_019

NEONATAL CONSULTATION, REFERRAL AND TRANSFER ARRANGEMENTS IN COLLABORATION WITH NETS (IB2020_015)

PURPOSE

This Information Bulletin clarifies the process for those seeking neonatal consultation, referral and transfer arrangements for an unwell neonate.

KEY INFORMATION

Newborn and paediatric Emergency Transport Service (NETS) is a statewide emergency service for clinical advice and/or retrieval of critically ill neonates, infants and children. NETS is a single point of access for public and private hospitals in NSW and the ACT.

All neonatal critical care transfer requests must be made through NETS.

NETS will coordinate a conference call between the referring clinician and receiving consultant in a tertiary and/or regional hospital to discuss neonatal patient care. This will include immediate care, escalation of local and regional support and transfer or neonatal retrieval.

NETS will provide advice to the referring facility on the final destination of the neonatal transfer and coordinate beds if required.

Where there is a difference of opinion regarding a neonatal transfer, the final decision to transfer will be made by the NETS medical retrieval consultant, in line with the NSW

Health Policy PD2010_030 *Critical Care Tertiary Referral Networks (Paediatrics).*

The Tiered Perinatal Network (TPN) Level 6 facility has a responsibility to accept the neonate if no other facility can accept the transfer.

The referring facility will update details on the Patient Flow Portal (PFP)/Inter-Hospital Transfer (IHT) with the patient details. For non PFP users, the receiving facility will enter the PFP/IHT.

Contact NETS on 1300 362 500

Early notification will enable early assistance.

In a time-critical emergency, NETS notification can occur

prior to full patient assessment and investigation.

NETS can be contacted on www.nets.org.au

PAEDIATRIC CLINICAL PRACTICE GUIDELINE (IB2020_041)

IB2020_041 rescinds PD2011_038, PD2013_053, GL2014_013, PD2012_056, PD2010_063, PD2011_024 and PD2010_053

PURPOSE

This Information Bulletin is to notify NSW Health that Paediatric Improvement Collaborative (PIC) Interstate Clinical Practice Guidelines have now been published and are hosted by the Royal Children's Hospital Melbourne.

The PIC is a collaboration between Royal Children's Hospital Melbourne, Safer Care Victoria (SCV, Victorian Department of Health), the NSW Agency for Clinical Innovation (ACI) and Clinical Excellence Queensland.

Provision of Interstate Clinical Practice Guidelines through PIC aims to reduce variation in care.

KEY INFORMATION

The PIC adapts Victorian State-wide and Royal Children's Hospital Melbourne Clinical Practice Guidelines (CPG) so that they can be used by Queensland, New South Wales & Victorian clinicians.

Interstate Clinical Practice Guidelines are reviewed on a rolling 2-year cycle. When a new guideline is required it is written using the tri-state collaboration process.

CPGs that have been reviewed and developed under the PIC process are hosted by the Royal Children's Hospital Melbourne webpage www.rch.org.au

Interstate clinical practice guidelines are now available at: https://www.rch.org.au/clinicalguide/

The Interstate Clinical Practice Guidelines are endorsed for use in NSW, therefore NSW Health policy documents for Clinical Practice Guidelines on the same topics as PIC Interstate Clinical Practice Guidelines are no longer current.

MANAGEMENT OF INFANTS AND CHILDREN WITH CONGENITAL TALIPES EQUINOVARUS (GL2014_014)

PURPOSE

The *Management of Infants and Children with Congenital Talipes Equinovarus (CTEV) Practice Guideline* has been developed to ensure a consistent, evidence based approach to the multidisciplinary management of infants and children born with structural CTEV in NSW. It is to be used in conjunction with the 'learnpaediatrics Congenital Talipes Equinovarus e-learning module' and practical training such as the Ponseti Education Day conducted by the Sydney Children's Hospitals Network (Randwick and Westmead).

The Practice Guideline was prepared for the NSW Ministry of Health by an expert clinical reference group.

KEY PRINCIPLES

This Guideline reflects what is currently regarded as a safe and appropriate approach to care and should be used as a guide to be followed in respect of each individual presentation. Each patient should be individually assessed and a decision made as to appropriate management in order to achieve the best clinical outcome. Local protocols may be developed based on this State-Wide guideline and all clinicians involved in the treatment of patients born with structural CTEV should be educated in the use of the guideline and locally developed protocols.

This document should be used as a guide, rather than as a complete authoritative statement of procedures to be followed in respect of each individual presentation.

It does not replace the need for the application of clinical judgement to each individual presentation.

USE OF THE GUIDELINE

Chief Executives should ensure:

- Local protocols are developed based on the *Management of Infants and Children with Congenital Talipes Equinovarus (CTEV)* Practice Guideline.
- Local protocols are in place in all hospitals and facilities likely to be required to assess or manage infants or children with CTEV.
- Ensure that all staff treating infants and children are educated in the use of the locally developed paediatric protocols.

Directors of Clinical Governance are required to inform relevant clinical staff treating paediatric patients of the new guideline.

To download the Guideline go to http://www.health.nsw.gov.au/policies/gl/2014/GL2014_014.html

INFANTS AND CHILDREN: ACUTE MANAGEMENT OF BRONCHIOLITIS (GL2018_001)

GL2018_001 issued 10/01/2018 rescinds PD2012_004.

PURPOSE

This Clinical Practice Guideline provides evidence based clinical direction for clinicians in the acute management of bronchiolitis in infants. It is aimed at achieving the best clinical care in the assessment, escalation and management of acute bronchiolitis in infants.

KEY PRINCIPLES

This Guideline applies to all facilities where paediatric patients are managed. It requires the Chief Executives of all Local Health Districts and Specialty Health Networks to determine where local adaptations are required or whether it can be adopted in its current format in all hospitals and facilities required to manage acute bronchiolitis in infants.

The Clinical Practice Guideline reflects what is currently regarded as a safe and appropriate approach to the management of acute bronchiolitis in infants. However, as in any clinical situation there may be factors which cannot be covered by a single set of guidelines. This document should be used as a guide, rather than as a complete authoritative statement of procedures to be followed in respect of each individual presentation**. It does not replace the need for the application of clinical judgement to each individual presentation.**

USE OF THE GUIDELINE

Chief Executives must ensure:

- This Guideline is adopted or local protocols are developed based on the Infants and Children: Acute Management of Bronchiolitis, Clinical Practice Guideline
- Local protocols are in place in all hospitals and facilities likely to be required to manage paediatric patients with bronchiolitis
- Ensure that all staff treating paediatric patients are educated in the use of the locally developed paediatric protocols.

Directors of Clinical Governance are required to inform relevant clinical staff treating paediatric patients of this revised guideline

The Guideline can be downloaded from Infants and Children - Acute Management of Bronchiolitis

INFANTS AND CHILDREN: ACUTE MANAGEMENT OF SORE THROAT (GL2014_021)

GL2014_021 rescinds PD2006_019.

PURPOSE

The *Infants and Children: Acute Management of Sore Throat, third edition* Clinical Practice Guideline has been revised to provide direction to clinicians and is aimed at achieving the best possible paediatric care in all parts of the state. The Clinical Practice Guideline was prepared for the NSW Ministry of Health by an expert clinical reference group under the auspice of the state-wide Paediatric Clinical Practice Guideline Steering Group.

KEY PRINCIPLES

This guideline applies to all facilities where paediatric patients are managed. It requires the Chief Executives of all Local Health Districts and specialty health networks to have local guidelines/ protocols based on the attached Clinical Practice Guideline in place in all hospitals and facilities required to assess or manage children with sore throat.

The Clinical Practice Guideline reflects what is currently regarded as a safe and appropriate approach to the acute management of sore throat in infants and children. However, as in any clinical situation there may be factors which cannot be covered by a single set of guidelines. This document should be used as a guide, rather than as a complete authoritative statement of procedures to be followed in respect of each individual presentation. **It does not replace the need for the application of clinical judgement to each individual presentation.**

USE OF THE GUIDELINE

Chief Executives must ensure:

- Local protocols are developed based on the *Infants and Children: Acute Management of Sore Throat: third edition* Clinical Practice Guideline.
- Local protocols are in place in all hospitals and facilities likely to be required to assess or manage paediatric patients with sore throat.
- Ensure that all staff treating paediatric patients are educated in the use of the locally developed paediatric protocols.

Directors of Clinical Governance are required to inform relevant clinical staff treating paediatric patients of this new guideline.

YOUTH HEALTH AND WELLBEING ASSESSMENT GUIDELINE
(GL2018_003 issued 1/2/2018)

PURPOSE

This guideline presents the current best evidence for conducting a youth health and wellbeing Assessment. Its purpose is to inform practice for healthcare providers to achieve the best possible care in NSW.

This guideline is primarily for clinicians caring for young people (12-24 years old) in a paediatric, adolescent or adult healthcare setting.

This guideline supports NSW Health's commitment to implement appropriate psychosocial assessment tools, such as HEEADSSS, to assess and respond to the holistic health and wellbeing needs of young people outlined in the *NSW Youth Health Framework 2017-2024* (PD2017_019).

KEY PRINCIPLES

Youth health and wellbeing assessments are important to assist clinicians to identify and respond early to areas of concern in a young person's life that might affect their health and wellbeing.

The youth health and wellbeing assessment is not a diagnostic tool. It is a holistic, flexible approach designed to build rapport and engage with a young person in a clinical setting. The information gathered can then be used to directly address any concerns and/or refer a young person for a specialist response.

The most widely used youth health and wellbeing assessment tool in Australia and internationally is known as a HEEADSSS assessment. Each letter of HEEADSSS reflects a major domain of a young person's life. Capturing information in each domain helps reveal risks, behaviours and protective factors. It helps to identify areas of intervention where the clinician can work with the young person to achieve better health outcomes.

- **H** Home
- **E** Education and Employment
- **E** Eating and Exercise
- **A** Activities, Hobbies and Peer Relationships
- **D** Drug Use (cigarettes, alcohol)
- **S** Sexual Activity and Sexuality
- **S** Suicide, Self-Harm, Depression, Mood, Sleeping Patterns
- **S** Safety and Spirituality

In general, a youth health and wellbeing assessment (12-24 years old) should be conducted with every young person who attends a health service or hospital. Where appropriate young people in an adult or paediatric inpatient area within a hospital should have a youth health and wellbeing Assessment completed in conjunction with other screening assessment/admission processes.

Clinical judgement should be used to determine the appropriateness of the assessment for 12-24 year olds. This includes considering the young person's health condition, maturity, the environment and health service context (for example, sufficient time or privacy may not be available in an Emergency Department context).

In general an assessment is done through conversation with a young person. On some occasions, where it is more appropriate a young person can be asked to complete the Youth Health and Wellbeing Assessment Chart (Appendix 1).

It is essential that clinicians/healthcare workers read and understand this guideline in particular Sections 6 to 11 of the Guideline.

- Section 6 Issues covered by a youth health and wellbeing assessment
- Section 7 When to conduct a youth health and wellbeing assessment
- Section 8 Youth health and wellbeing assessment flow diagram
- Section 9 Self-completed assessment using Youth Health and Wellbeing Assessment Chart
- Section 10 Setting up and concluding the assessment
- Section 11 Contraindications and cautions

USE OF THE GUIDELINE

This guideline should be considered when conducting Youth Health and Wellbeing Assessment with young people (12-24 years old) who attend a health service or hospital.

This document outlines the -

- approach that should be taken by NSW Health staff when conducting a youth health and wellbeing assessment (Sections 7 - 10)
- ssues to consider when implementing the youth health and wellbeing assessment within different health settings and with different age groups (Sections 11 - 12)

A range of resources for workers are available to support Youth Health and Wellbeing Assessment when needed (Appendices 1 – 4).

The document should not be seen as a prescriptive set of rules to be applied without the clinical input and discretion of the managing health professionals. Each patient should be individually evaluated and a decision made as to appropriate management in order to achieve the best clinical outcome.

To download the guideline go to Youth Health and Wellbeing Assessment

INFANTS AND CHILDREN: INITIAL MANAGEMENT OF FEVER OR SUSPECTED INFECTION IN ONCOLOGY AND STEM CELL TRANSPLANTATION PATIENTS (GL2015_013)

PURPOSE

The *Infants and Children: Initial Management of Fever or Suspected Infection in Oncology and Stem Cell Transplantation Patients, first edition* Clinical Practice Guideline has been developed to provide direction to clinicians and is aimed at achieving the best possible paediatric care in all parts of the state. The Clinical Practice Guideline was prepared for the NSW Ministry of Health by an expert clinical reference group under the auspice of NSW Kids and Families.

KEY PRINCIPLES

This guideline applies to all facilities where paediatric patients are managed. It requires the Chief Executives of all Local Health Districts and specialty health networks to determine where local adaptations are required or whether it can be adopted in its current Clinical Practice Guideline format in all hospitals and facilities required to manage infants and children undergoing therapy for cancer or stem cell transplantation presenting with fever or suspected infection.

The clinical practice guideline reflects what is currently regarded as a safe and appropriate approach to the management of fever or suspected infection in infants and children undergoing therapy for cancer or stem cell transplantation. However, as in any clinical situation there may be factors which cannot be covered by a single set of guidelines. This document should be used as a guide, rather than as a complete authoritative statement of procedures to be followed in respect of each individual presentation. **It does not replace the need for the application of clinical judgement to each individual presentation.**

USE OF THE GUIDELINE

Chief Executives must ensure:

- Hospitals and facilities either adopt this protocol or adapt local protocols to comply with the *Infants and Children: Initial Management of Fever or Suspected Infection in Oncology and Stem Cell Transpantation Patients, first edition* Clinical Practice Guideline
- Local protocols are in place in all hospitals and facilities likely to be required to manage paediatric oncology and stem cell transplantation patients with fever or suspected infection
- Ensure that all staff treating paediatric patients are educated in the use of the locally developed paediatric protocols.

Directors of Clinical Governance are required to inform relevant clinical staff treating paediatric patients of this new guideline.

The guideline *Infants And Children: Initial Management Of Fever Or Suspected Infection In Oncology And Stem Cell Transplantation Patients* can be downloaded at the following link –

Infants and Children: Initial Management of Fever/Suspected Sepsis in Oncology /Transplant Patients

PAEDIATRIC PROCEDURAL SEDATION - GUIDE FOR EMERGENCY DEPARTMENTS, WARDS, CLINICS AND IMAGING

(GL2018_011 issued 4/5/2018)

PURPOSE

Paediatric Procedural Sedation - Guide for Emergency Departments, Wards, Clinics and Imaging provides direction to clinicians and is aimed at achieving the best possible paediatric care in all parts of the state. The guide was prepared for the NSW Ministry of Health by an expert clinical reference group.

KEY PRINCIPLES

This guide applies to all facilities where paediatric patients are managed. It requires the Chief Executives of all Local Health Districts and Speciality Health Networks to determine where local adaptions are required or whether it can be adopted in its current format in hospitals and facilities required to manage procedural sedation of paediatric patients.
This guide applies to all facilities where paediatric patients are managed. It requires the Chief Executives of all Local Health Districts and Speciality Health Networks to determine where local adaptions are required or whether it can be adopted in its current format in hospitals and facilities required to manage procedural sedation of paediatric patients.

This guide reflects what is currently regarded as a safe and appropriate approach to the management of procedural sedation for paediatric patients. However, as in any clinical situation there may be factors which cannot be covered by a single guide. This document should be used as a guide, rather than as a complete authoritative statement of procedures to be followed in respect of each individual presentation. It does not replace the need for the application of clinical judgement to each individual presentation.

USE OF THE GUIDELINE

Chief Executives must ensure:

- This guide is adopted or local procedures are developed based on the PaediatricProcedural Sedation Guide for Emergency Departments, Wards, Clinics andImaging.
- Local protocols are in place in all hospitals and facilities likely to be required to manage paediatric patients requiring procedural sedation
- Ensure that all staff treating paediatric patients are educated in the use of the locally developed paediatric protocols.

Directors of Clinical Governance are required to inform relevant clinical staff treating paediatric patients of this revised guideline.

Paediatric Procedural Sedation - Guide for Emergency Departments, Wards, Clinics and Imaging

NEONATAL - JAUNDICE IDENTIFICATION AND MANAGEMENT IN NEONATES ≥ 32 WEEKS GESTATION (GL2016_027)

GL2016_027 incorporates content from obsolete Guideline GL2007_001 Neonatal Exchange Transfusions in NSW as notified in IB2016_062.

PURPOSE

This Guideline provides a framework for the early identification and management of jaundice in neonates ≥ 32 weeks gestation. Approximately 60% of neonates born at term and 85% of preterm neonates will develop jaundice. Many of these neonates will develop 'physiological jaundice', which is usually benign. However, when unconjugated serum bilirubin levels are too high, bilirubin can cross the blood brain barrier. Bilirubin is neurotoxic, particularly to the auditory nerve and basal ganglia, which can result in brain injury and lifelong disability. It is important therefore, to identify those neonates at risk of acute bilirubin encephalopathy and kernicterus.

KEY PRINCIPLES

This Guideline applies to all NSW Public Health Organisations providing care for neonates ≥ 32 weeks gestation which should include:

- The identification at birth of neonates with risk factors for neonatal jaundice
- Regular visual assessment from birth of all neonates
- Management of neonatal jaundice identified in the first 24 hours of age
- Management of neonatal jaundice identified ≥ 24 hours of age
- Follow-up care for neonates discharged at less than 3 days of age with risk factors for jaundice or jaundice at discharge
- Assessment and escalation of care for neonates with prolonged jaundice > 14 days of age in a term neonate, and beyond 21 days in a preterm neonate.

USE OF THE GUIDELINE

The Chief Executives of all NSW Local Health Districts are responsible for the implementation of this guideline within their services / facilities to ensure:

- Local processes and operating procedures are developed in line with this document to manage neonates ≥ 32 weeks gestation to ensure:
  - Prompt appropriate identification, management and escalation of neonatal jaundice
  - Equipment is used, maintained and its effectiveness is monitored
  - Discharge is planned and follow up processes are in place
  - Assessment and appropriate escalation of care for neonatal jaundice > 14 days of age in a term neonate and beyond 21 days in a preterm neonate.
- The Directors of Clinical Governance inform relevant staff in maternity, neonatal services and biomedical departments of this new Guideline
- Morbidity and mortality associated with neonatal jaundice is monitored and reviewed.

To download the Guidelines please go to
Neonatal - Jaundice Identification and Management in Neonates ≥ 32 Weeks Gestation

HYPOXIC ISCHAEMIC ENCEPHALOPATHY IN NEWBORNS - RECOGNITION, MONITORING AND EARLY MANAGEMENT (IB2023_028)

IB2023_028 replaced PD2010_006

PURPOSE

This Information Bulletin notifies the NSW Health system of the publication of the Clinical Practice Guide Hypoxic ischaemic encephalopathy in newborns - recognition, monitoring and early management.

KEY INFORMATION

The Hypoxic ischaemic encephalopathy in newborns - recognition, monitoring and early management provides guidance on the management of newborns with hypoxic ischaemic encephalopathy who may benefit from therapeutic hypothermia.

The Clinical Practice Guide is accompanied by a parent information sheet Therapeutic hypothermia (cooling) to protect babies with hypoxic ischaemic encephalopathy (HIE) and the evidence check document Therapeutic hypothermia in neonatal hypoxic ischemic encephalopathy.

The management of newborns with HIE includes:

- identification and management of newborns with encephalopathy through the use of the Newborn Encephalopathy Pathway
- assessment of the severity of encephalopathy in newborns using the Encephalopathy Severity Tool every hour in the first six hours of birth
- criteria for initiating therapeutic hypothermia for newborns and initial management in neonatal units.

General principles

Resuscitation and stabilisation of the newborn should be prioritised before commencing therapeutic hypothermia.

Therapeutic hypothermia must not be commenced without discussion with the Newborn and Paediatric Emergency Transport Service (NETS) and a tertiary centre neonatologist.

All newborns for whom therapeutic hypothermia has been commenced should be transferred to a neonatal intensive care unit (NICU) for ongoing management.

Reporting

Reporting processes via the incident management system (ims+) should be in place to monitor the incidence of newborns with moderate or severe encephalopathy. Serious incidents, including term newborns diagnosed with severe HIE or who receive therapeutic hypothermia, should be notified to the NSW Ministry of Health via a Reportable Incident Brief in accordance with the NSW Health Policy Directive Incident Management (PD2020_047).

CHILD WELLBEING AND CHILD PROTECTION POLICIES AND PROCEDURES FOR NSW HEALTH (PD2013_007)

PD2013_007 rescinds PD2005_299, PD2006_104, PD2007_023, PD2011_057, PD2011_065, GL2011_008, IB2010_005, IB2012_002.

PURPOSE

This policy articulates the professional and legal responsibilities of all health workers to promote the health, safety, welfare and well-being of children and young people, working collaboratively with interagency partners in the shared system of child protection in NSW. These responsibilities apply whether workers are providing health care directly to children and young people or to adult clients who are parents/carers or are pregnant.

This policy informs Local Health Districts, Specialty Health Networks, other health services and health workers about the tools and resources available and the interagency arrangements in place to assist them to meet their responsibilities and provide a consistent NSW Health response to child protection and wellbeing.

MANDATORY REQUIREMENTS

Every health worker has a responsibility to protect the health, safety, welfare and wellbeing of children or young people with whom they have contact.

The legal responsibilities of health services and health workers are identified in the following legislation:

Children and Young Persons (Care and Protection) Act 1998

- Collaborate with interagency partners and comply with information exchange provisions to promote the safety, welfare and wellbeing of children and young people, including taking reasonable steps to coordinate the provision of services with other agencies;
- Meet requirements for mandatory reporting of children and reporting of young people (or classes/groups of children or young people) at suspected risk of significant harm (ROSH);
- Report unborn children where it is suspected they may be at ROSH after their birth;
- Respond to the needs of children and young people after making a report to Community Services or to the NSW Health Child Wellbeing Unit;
- Respond to Community Services' and Children's Court requests to provide health services and or Community Services and Police Force requests to provide medical examinations and treatment;
- Assist with Children's Court proceedings when required.

Commission for Children and Young People Act 1998/*Child Protection (Working with Children) Act 2012*

- Meet requirements to ensure that only people with valid Working with Children Checks are engaged in child related work (where a child is under the age of 18 years).

Ombudsman Act 1974

- Maintain systems to prevent 'reportable conduct' by health workers and for reporting and responding to alleged reportable conduct involving NSW Health employees.

The policy responsibilities of health workers are to:

- Recognise and respond appropriately to the vulnerabilities, risks and needs of families, children and young people when providing any health service;

- Collaborate across NSW Health services and with interagency partners to support and strengthen families and promote child health, safety, welfare and wellbeing;
- Use the Mandatory Reporter Guide and seek assistance from the NSW Health Child Wellbeing Unit to help identify children or young people at suspected risk of significant harm (ROSH);
- Seek assistance from the NSW Health Child Wellbeing Unit and the Family Referral Services to help respond to vulnerable families, children and young people below the ROSH threshold;
- Actively seek feedback from Community Services after making a child protection report and continue to support the child, young person or family consistent with the health worker's roles and responsibilities;
- Follow the Child Wellbeing and Child Protection - NSW Interagency Guidelines and other agreed interagency procedures when working with children, young people and families, including in relation to information exchange, High Risk Birth Alerts, Prenatal Reporting, escalation of child protection concerns, assumption of care by Community Services and out of home care health assessments;
- Collaborate in joint investigation and response to matters involving alleged child sexual assault or serious child abuse or neglect leading to criminal proceedings; and
- Participate in mandatory and/or other child protection training for NSW Health workers.

IMPLEMENTATION

Chief Executives across the NSW public health system are responsible and accountable for:

1. Ensuring that this policy and the associated *Child Wellbeing and Child Protection Fact Sheet for NSW Health Workers* are understood and implemented by all health workers; and
2. Enabling frontline staff to operationalise this Policy Statement in accordance with the attached *Child Wellbeing and Child Protection Policies and Procedures for NSW Health*.

To access the **Child Wellbeing and Child Protection Policies and Procedures for NSW Health** please go to http://www.health.nsw.gov.au/policies/pd/2013/PD2013_007.html

STATEWIDE EYESIGHT PRESCHOOLER SCREENING (StEPS) PROGRAM (PD2018_015)

PD2018_015 rescinds PD2012_001

PURPOSE

The purpose of this policy directive is to guide StEPS coordinators in the consistent implementation and management of the Statewide Eyesight Preschooler Screening (StEPS) program at the Local Health District (LHD) level.

This policy directive describes the roles and responsibilities of StEPS personnel and training requirements, identifying four year old children for vision screening, vision screening protocols, referral processes and reporting requirements so that childhood vision problems can be detected early and treatment outcomes maximised.

MANDATORY REQUIREMENTS

LHDs must ensure compliance with the requirements set out in this policy directive as the basis for administering the StEPS program in LHDs. Mandatory requirements for the StEPS program are:

- Vision screening protocols relating to consent, vision screening, assessment, referrals, referral follow up, and reporting and data management (Section 2).
- All four year old children in LHDs, including disadvantaged groups and children with special needs, should be offered the StEPS program, to meet StEPS performance benchmarks (Section 3).
- StEPS vision screening staff must be suitably trained and provided with the necessary equipment and resources to conduct vision screening (Sections 4 and 5).
- All standardised templates attached to this policy are used by LHDs when administering the StEPS program (Section 7).
- LHDs must develop operating processes consistent with this policy directive, to maximise screening and meet local needs in each LHD.

IMPLEMENTATION

The Ministry of Health provides funding to assist LHDs in the implementation of the StEPS program in NSW. This policy directive applies to all staff and relevant managers involved in delivering the StEPS program in LHDs across NSW.

Roles and Responsibilities

Ministry:

- Provide mandatory requirements and guidelines for the implementation and management of the StEPS program.
- Evaluate the overall efficiency and performance management of the StEPS program in LHDs across NSW.
- Meet regularly with all LHDs through the StEPS Coordinators Meetings to review overall progress and implementation of the StEPS program in LHDs.
- Ensure the content of this StEPS policy directive is effectively communicated to all staff involved in coordinating the StEPS program in NSW.

LHDs:

- Actively identify all four year old children in their LHDs to offer them a free StEPS vision screen.
- Assign responsibility and personnel to implement the StEPS program in line with this policy directive.
- Ensure appropriate vision screening staff are employed, that vision screening staff are trained to undertake the StEPS vision screen, and staff are provided with appropriate equipment and resources to carry out the functions of the StEPS program.
- Ensure compliance and full implementation of this policy directive in their LHD.
- Ensure that the budget provided for the StEPS program is expended on implementing the StEPS program.
- Provide all required reports to the Ministry of Health relating to screening activity, referrals, assessments, follow ups, monitoring and reporting.
- ensure that StEPS performance benchmarks are achieved and maintained (Section 3.3)
- Ensure the content of this StEPS policy directive is effectively communicated to all staff involved in implementing the StEPS program in the LHD.

1. BACKGROUND

The Statewide Eyesight Preschooler Screening (StEPS) program is a universal, evidence based, free vision screening program for all four year old children in NSW.

The program actively identifies all four year old children in NSW to offer them a free StEPS vision screen and is designed to identify childhood vision problems early, prior to school entry, so that treatment outcomes can be maximised.

The StEPS program is an important component of the NSW Child Health Screening and Surveillance Program, as documented in the NSW Personal Health Record (PHR), the 'Blue Book'. The NSW PHR recommends a vision examination at the newborn health check, vision surveillance at the 1-4 week, 6-8 week, 6 month, 12 month, 18 month, 2 year and 3 year child health checks, and a monocular visual acuity screen at the 4 year child health check.

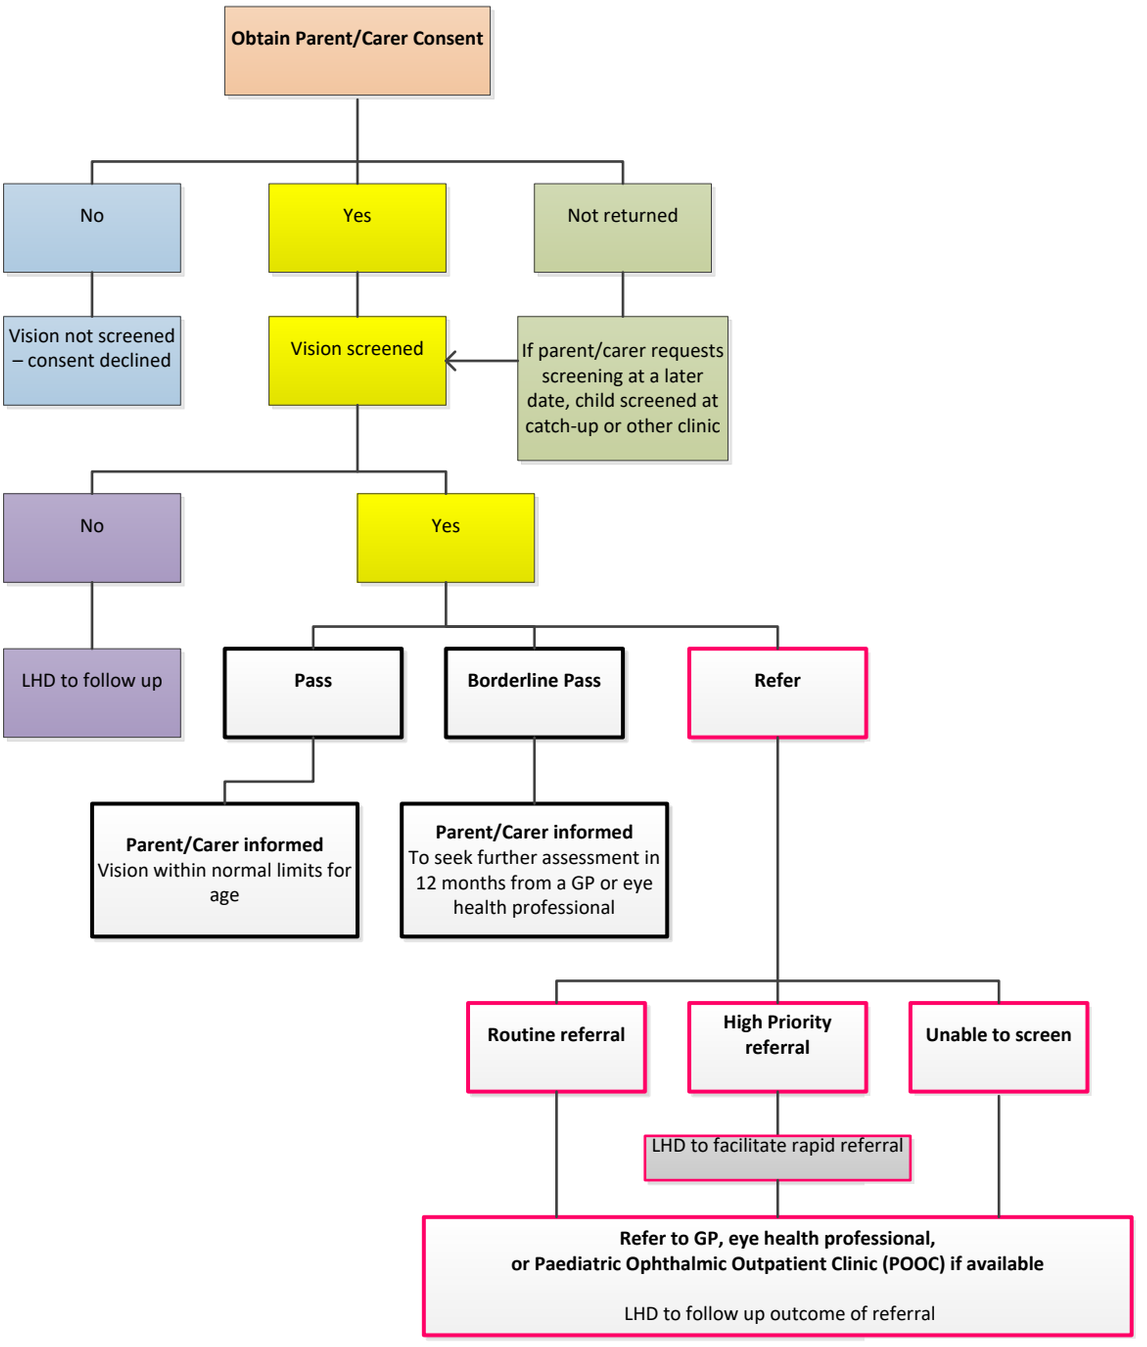
Vision develops from birth to approximately eight years of age, and is fully mature by the mid-teenage years. Early identification and treatment of eye and vision problems aims to optimise vision prior to starting school and reduces the likelihood of permanent vision loss. The StEPS program targets children at four years of age, the first opportunity for a child's visual acuity to be reliably screened at a population level.

While eye health surveillance can monitor a child for outward signs of eye or vision problems, the two most common childhood vision problems, amblyopia and refractive error, cannot be detected by family history, vision surveillance or observing a child's behaviour or appearance. These vision disorders can only be detected if a monocular visual acuity screen is conducted by a trained vision screener.

2 VISION SCREENING PROTOCOLS

2.1 StEPS Referral Pathway Flowchart

The figure below outlines the StEPS Referral Pathway:



2.2 Pathway for screening, referral, assessment and follow up

LHDs must have clearly documented protocols, consistent with this StEPS Policy Directive for approaching services to offer the StEPS vision screening program, offering parents/carers the StEPS vision screen for their child, the provision of the vision screening service, documenting the outcome of the vision screen, informing parent/carers of the outcome of the vision screen, and for referral and follow up of referrals.

Standardised templates attached to this policy (Section 7) must be used to implement and administer the StEPS program in NSW.

2.3 Consent

Consent from parent/carer for child to participate in the StEPS program at a preschool, child care centre or other service must be obtained prior to undertaking the StEPS vision screen. The following standardised information letter and consent forms are to be used to obtain signed consent:

- *StEPS Important Notice for all Parents/Carers (*Attachment 2).
- *StEPS Consent and Results Form* (Attachment 3).

Consent forms, information letters and flyers about the StEPS program and LHD privacy information should be provided to the preschool/child care centre where the screening will occur at least two weeks prior to the screening date. Completed and signed consent forms must be collected prior to the screening date or on the day of screening. Consent may be accepted by the StEPS vision screener up to and including the day of screening. If verbal consent is provided, this must be documented on the consent form by the vision screener.

If a consent form is returned and the parent/carer has consented to screening, but the child is absent on the day of screening, a follow-up screening offer should be made. At least two vision screening follow up offers should be made (and documented) where consent is obtained but screening is not conducted.

If the consent form is not returned, LHDs should have screening options available for parents/carers who request screening for their child at a later date, such as catch-up and other clinics.

If consent is not provided, that is, the consent form is returned but consent is declined, this must be recorded appropriately.

To monitor and assist in accurately recording the number of StEPS vision screenings offered, it is recommended that LHDs enquire about the number of children who:

- Are four years of age, or who will be turning four years of age.
- Are eligible to attend school in the following calendar year.
- Are attending the centre where the StEPS vision screening will take place
- Are able to provide the correct corresponding number of consent forms.

The target group of children for StEPS screening are those aged four years who are starting school the following year. Children who are five years of age and have not previously received a StEPS vision screen are also eligible to be offered the StEPS program. Three year old children who are eligible to start school the following year may be screened at the StEPS coordinator's discretion.

2.4 Vision Screening

LHDs must coordinate and organise the StEPS vision screening with relevant parties at a suitable screening location. Consideration should be given to preschools/childcare centres with specific attendance patterns such as split week attendance to ensure a high uptake of screening and the number of screening days required to screen all children appropriately. StEPS vision screening staff should arrange an appropriate area to conduct the StEPS vision screening in consultation with the preschool/child care centre.

Wherever possible, StEPS vision screening staff must conduct a monocular visual acuity screening test using the approved 6 metre HOTV logMAR chart or Sheridan Gardiner Linear Chart. If the screening location does not have the required space available for the 6 metre chart, the approved 3 metre HOTV logMAR or Sheridan Gardiner Linear Chart can be used. The matching board corresponding to the chart used is to be provided to all children to enable children to match the letter indicated to by the vision screener with the letter on the matching board.

Vision screeners should also review the consent form carefully noting any parental/carer concerns, perform a visual inspection of the eyes and observe the child carefully (for example, does the child constantly close one eye in sunlight, do both eyes move together equally in all direction of gaze, does the child consistently tilt their head or turn their face to one side) to determine if any abnormalities may be present which could affect either the vision or the child's general eye comfort. If there are concerns following visual inspection of the eyes, for example, red eyes, red lid margins, or excessive watering, the child should be referred to their General Practitioner. Vision screeners should carefully observe and refer any possible eye or vision abnormalities even if the visual acuity result is within normal range.

To conduct a monocular visual acuity test, the screener must occlude the left eye first using the recommended occlusion glasses. A folded tissue is placed between the occluded eye and the glasses. If the child already wears glasses, use a single-use eye patch with a tissue between their glasses and the eye patch. LHD infection control procedures must be followed.

The test results for each eye must be accurately recorded by the vision screener on the *StEPS Consent and Results Form* (Attachment 3) and *Notification of StEPS Vision Screening Results Letter* (Attachment 4) as appropriate.

2.5 Documenting Results of the Vision Screening

2.5.1 Consent and Results Form

The vision screener must complete the results section of the *StEPS Consent and Results Form* (Attachment 3) to document the vision screening results.

All sections of the *StEPS Consent and Results Form* must be completed, signed and dated. Relevant actions relating to completing a *StEPS Results Notification Letter* and *StEPS Referral Letter* must be identified on the form. All *StEPS Consent and Results Forms* must be promptly forwarded to the StEPS Coordinator as per LHD procedures.

2.5.2 Notification of StEPS Vision Screening Results Letter

The *Notification of StEPS Vision Screening Results Letter* (Attachment 4) is used to inform parents of the outcome of vision screening and must be completed and forwarded to all parents/carers of children who participated in the StEPS program.

Notification of the vision screening result should be provided as soon as practical, preferably on the day of the screening.

If the parent/carer has indicated on the *StEPS Consent and Results Form* (Attachment 3) that the child is under the care of an eye health professional, the vision screener must advise on the *Notification of StEPS Vision Screening Results Letter* (Attachment 4) for parent/carer to continue care. If there are any concerns about the child's current treatment, vision screeners must discuss this with their StEPS Coordinator. LHDs should encourage parents/carers to add the *Notification of StEPS Vision Screening Results Letter* to their child's Personal Health Record.

All parents are encouraged to ensure their child attends a Before School Health Assessment at 4 years of age, as per the NSW Personal Health Record (Blue Book).

2.5.3 Inclusion of forms and letters in the electronic medical record

If the child's electronic medical record is available, the *StEPS Consent and Results Form* (Attachment 3) is scanned and forms part of the child's electronic medical record. The *StEPS Referral Letter* (Attachment 5) may be scanned and included as correspondence accompanying the child's medical record.

2.5.4 Confidentiality

All information collected and results are confidential and must not be provided to or discussed with others, including staff at the preschool or child care centre, without parent/carer consent. To ensure privacy, all *Notification of StEPS Vision*

Screening Results letters (Attachment 4) are to be placed in a sealed envelope with the child's name on the outside of the envelope. Vision screeners must liaise with relevant parties (e.g. preschool/child care director) at the screening location to determine the most appropriate mechanism for providing the results of the StEPS vision screen to parents/carers.

2.5.5 StEPS Referral Letter

All parents/carers of children who require a referral must be provided with a *StEPS Referral Letter* (Attachment 5). The referral letter may be completed by the vision screener, StEPS Coordinator or Administration Officer as per LHD procedures.

2.6 Referral Criteria

The StEPS program uses pass/refer criteria that correlate to specific, evidence-based visual acuity results. Following the StEPS vision screen, the criteria for making a referral based on the vision screening result are as follows:

a) Pass - visual acuity of 6/9 (3/4.5) or above

- A child with visual acuity of 6/9 (3/4.5) or above in both eyes is considered to have passed the StEPS visual acuity screen.
- Referral is not required.

b) Borderline Pass - visual acuity of 6/9-1 (3/4.5-1) or 6/9-2 (3/4.5-2)

- A child with visual acuity of 6/9-1 (3/4.5-1) or 6/9-2 (3/4.5-2) in one or both eyes is considered a borderline pass.
- Parents/carers are advised to re-test in 12 months by an Eye Health Professional.

c) Refer - visual acuity of less than 6/9-2 (3/4.5-2) in one or both eyes

- A child with visual acuity of less than 6/9-2 (3/4.5-2) in one or both eyes is considered to have not passed the StEPS visual acuity screen.
- Parents/carers are advised to have their child's eyes tested by a General Practitioner or Eye Health Professional.

d) Refer - obvious pathology

- A child with obvious pathology on observation of external eye and adnexa that is currently untreated should be referred for review.
- Parents/carers are advised to have their child's eyes reviewed by a General Practitioner.

e) High Priority Referral - visual acuity of 6/18 (3/9) or less in one or both eyes

- A child with visual acuity of 6/18 (3/9) or less in one or both eyes is considered a high priority referral.
- Parents/carers are advised to have their child's eyes tested by a General Practitioner or Eye Health Professional as a matter of urgency.
- Referral may be made to Paediatric Ophthalmic Outpatient Clinics (POOCs) according to *StEPS Referral Protocols for POOCs* (Attachment 6).

f) Refer - unable to be screened

- A child who has a valid consent but is unable to be screened, for example if they are uncooperative or unable to perform the test, should be referred.
- Parents/carers are advised to follow up with an Eye Health Professional.

2.7 Follow-up of referrals

All referrals from the StEPS Program must be actively followed up by the StEPS Coordinator as per this Policy Directive and LHD procedures. Wherever possible, StEPS Coordinators should ensure that High Priority Referrals receive a diagnostic vision assessment within one month, and other referrals receive an assessment within six months.

StEPS Coordinators are to offer assistance to families to ensure the child receives a diagnostic eye assessment within the appropriate timeframe. This may include, but is not limited to, offering secondary screening Orthoptic services and/or referral to the StEPS Paediatric Ophthalmic Outpatient Clinics (POOCs). StEPS Coordinators should consider any barriers to receiving a diagnostic assessment and subsequent treatment and assist families wherever possible to access appropriate services.

StEPS Coordinators must monitor all follow up referrals and report on the outcomes. If no eye health professional report is received and the outcome is unknown, the parent/carer must be contacted to determine the outcome and the result recorded. If possible, the name of the eye health professional who provided the assessment/treatment should be sought from the parents and the eye health professional then contacted to confirm the outcome.

The *StEPS Referral Outcomes Report* (Attachment 10) must be completed to record the outcome of the referral as a result of the StEPS vision screening. These reports can be used to demonstrate the accuracy of vision screening undertaken and the effectiveness of the StEPS program.

2.8 Mandatory Reporting for the StEPS program

StEPS Coordinators must complete and submit StEPS Screening Activity and StEPS Referral Outcomes reports for the StEPS program to the Ministry. Where an electronic medical record system is available in the LHD, electronic reporting and data extraction files should be submitted as reports to the Ministry. If electronic medical records are not available, these may be submitted as manual reports using the following templates:

- Quarterly *StEPS Screening Activity Report* (Attachment 9)
- Quarterly *StEPS Referral Outcomes Report* (Attachment 10)

2.9 Data Management

LHDs are responsible for developing and maintaining a database to record all children who have participated in the StEPS program. This will enable ease of scheduling, screening, tracking referrals, follow up referrals, reporting on referral outcomes and responding to enquires from parents/carers on vision screening.

All children who have participated in the StEPS program must be recorded on a database developed and maintained by LHDs. This database must include client/patient identifying details and parents contact details in accordance with PD2007_094 Client Registration Policy', as well as screening location, date of screening, result of screening, follow up of referrals, and the outcome and diagnosis following referral where applicable. It is recommended that terminology used to record the outcomes of referrals is consistent with language used in the referral outcomes report.

Where an electronic medical record system is available in the LHD, the appropriate electronic documentation for StEPS should be completed and data extraction files submitted as reports to the Ministry of Health.

2.9.1 Retention and Disposal of StEPS patient/client records

For all children who receive a StEPS vision screen, the *StEPS Consent and Results Form* (Attachment 3) must be incorporated into the main Community Health client record system and retained until the child attains or would have attained the age of 25 years. This applies to children who are found to have no abnormality on screening, as well as those children who receive a borderline pass or are referred for any reason.
Where the StEPS Consent and Result Form is in paper format and is not imaged or scanned, the original paper form must be retained for 25 years. It can then be disposed of according to LHD procedures.
Where the StEPS Consent and Result Form is imaged or scanned, the original Form should be retained until it has been verified that the scanned copy clearly displays all elements of the original record, as per NSW State Records 'General Retention and Disposal Authority – Public Health Services: Patient/Client Records' (GDA 17). Once verified, the paper Form can then be disposed of according to LHD procedures. The imaged Form must be retained for 25 years.

3 IDENTIFYING FOUR YEAR OLD CHILDREN

3.1 Identifying Four Year Old Children

All four year old children in NSW are to be actively identified to be offered a free StEPS monocular visual acuity screen by StEPS Coordinators within their designated LHDs. Strategies to identify four year old children may include, but are not limited to, contacting the following services to offer the StEPS program:

- preschools
- child care centres
- family day care services
- early intervention services
- refugee services
- Child and Family Health Services
- Playgroups
- immunisation clinics
- Department of Education and Communities, Schools for Specific Purposes

- Community vision screening days
- School Orientation programs (this strategy should only be used where the eligible child was not able to be identified through alternative strategies).

3.2 Disadvantaged groups of children and children with special needs

Disadvantaged groups of children and children with special needs are to be actively identified to ensure they are offered StEPS screening. For the purposes of the StEPS program, the following groups of children are classified as 'disadvantaged groups':

- Aboriginal and Torres Strait Islander children.
- Children attending 'Early Intervention Services'.
- Children attending 'Schools as Community Centres (SACCs) Playgroups'.
- Children whose parents attend Mental Health Services.
- Children in 'Out of Home Care'.
- Refugee children.
- Socioeconomically disadvantaged children.

Children with special needs are children who have been identified with developmental delay and/or neurological deficits.

StEPS Coordinators are to develop local strategies that meet the needs of their LHD in order to ensure maximum vision screening and equity of access to the StEPS program for all four year old children.

3.3 Service Level Agreement

The Service Level Agreement of the StEPS program is:

- A minimum of 80% of eligible four year old children have screening conducted

Wherever a parent/carer completes a StEPS consent form and agrees to their child participating in the StEPS program the LHD must make every effort to ensure that the child's vision is screened according to StEPS protocols.

LHDs are to ensure that the StEPS Service Level Agreement is maintained according to the estimated target population numbers of four year olds in their LHD provided by the Ministry of Health.

4 StEPS PERSONNEL

4.1 Vision Screening Staff

StEPS vision screening staff are employed by LHDs, under the supervision of LHD StEPS Coordinators to conduct monocular visual acuity screening assessments for four year old children.

StEPS vision screening must be conducted by suitably trained staff competent in using the StEPS vision screening equipment to undertake vision screening for four year old children. Screening assessments are undertaken in locations deemed appropriate by LHDs and can include settings such as preschools, child care centres, community settings and Child and Family Health Services.

StEPS vision screening staff are responsible for:

- liaising effectively with preschool and child care centre staff, parents, team members and other health care professionals in a professional and caring manner

- conducting vision screening according to vision screening protocols consistent with this StEPS policy directive relating to obtaining consent, referral processes, appropriate testing set up, vision screening equipment gathering and utilising information as required for effective vision screening
- ensuring the vision screening process creates minimal disruption to the location where screening is undertaken
- ensuring the confidentiality and privacy of the child is maintained at all times and all relevant information about the screening process and vision screening results is provided to parents/carers
- ensuring all mandatory requirements and reporting mechanisms relating to vision screening, consent, referrals processes, notification of results and LHD protocols are undertaken
- adhering to all LHD Work Health and Safety and Infection Control protocols
- maintaining vision screening equipment and reporting malfunctioning equipment to the StEPS Coordinator
- advising the StEPS Coordinator of any issues, incidents, problems or concerns that arise during a vision screening session.

4.2 StEPS Coordinator

StEPS Coordinators are employed by LHDs to implement, coordinate and manage the day to day operations of the StEPS program.

StEPS Coordinators develop and maintain strong links with all relevant stakeholders in their LHD, such as child health services, parents and carers, early childhood education and care providers, eye health professionals, general practitioners, medical specialists, Aboriginal Community Controlled Health Services, early intervention and coordination programs and other government and non-government agencies, to promote the StEPS program and to ensure the StEPS program is delivered effectively in their respective LHDs.

StEPS Coordinators are responsible for:

- ensuring all four year old children in their LHD are actively identified and offered a StEPS vision screen, including providing screening services as required
- recruiting vision screening staff as required, training and/or arranging the training to be provided to StEPS vision screeners by a suitably qualified health professional
- supervision and professional development of StEPS vision screeners to ensure that competency in vision screening is achieved and maintained, and that all applicable LHD protocols are followed
- ensuring transportation is available for StEPS vision screeners to travel to screening locations, according to resources available in the LHD. This may include access to a motor vehicle or approval to use private vehicles with the provision of a mileage allowance according to LHD protocols
- ensuring all appropriate supplies and maintenance of equipment, relevant forms and promotional material is available to conduct StEPS vision screening
- maintaining the confidentiality and privacy of the children screened and providing support to parents as appropriate in the period between vision screening and diagnostic assessment

- developing vision screening protocols for screening, referral, assessment and follow up consistent with the StEPS Policy Directive
- developing local processes to ensure disadvantaged groups of children and children with special needs are actively identified for the StEPS program
- data management and monitoring of key performance indicators, vision screening referral rates, referral outcomes, follow up referrals and submitting relevant reports to the NSW Ministry of Health as required.
- setting up and maintaining a database to record information on all four year old children who participated in the StEPS program for quality management
- effectively managing the LHD StEPS budget to ensure the program is implemented efficiently in the LHD including all printing costs relating to information flyers, brochures, letters and forms on the StEPS program
- attending NSW Ministry of Health StEPS Coordinators meetings as required and being the main point of contact for the StEPS program in their LHDs

4.3 StEPS Administration Officer

StEPS Administration Officers are employed by LHDs to provide administrative duties as deemed appropriate by the StEPS Co-ordinator. Duties may include, but are not limited to, arranging and confirming vision screening bookings, organising consent form packages, StEPS data entry and general office tasks.

4.4 Orthoptist

Orthoptists may be employed to provide comprehensive secondary vision screening for children referred via the StEPS program. Orthoptists may also provide vision screening services for children identified with 'special needs' and undertake additional vision screening tests considered appropriate to a child's individual developmental level. Orthoptists may also investigate and diagnose ocular motility disorders and assist in transitioning the family to timely diagnostic assessment services where appropriate.

Orthoptists may also assist in the training of vision screening staff.

4.5 StEPS Outpatient Clinics

Dedicated StEPS tertiary Paediatric Ophthalmic Outpatient Clinics (POOCs) have been established for children identified with potentially significant vision loss and referred as a 'High Priority Referral'. POOCs will ensure that such children receive a diagnostic vision assessment in a timely manner so that treatment outcomes can be maximised. Ongoing management and treatment of a child diagnosed with a vision problem via POOCs should be at the discretion of the eye health professional in consultation with the parent/carer.

Referrals to POOCs are available from anywhere in NSW. Children can be referred according to *StEPS Referral Protocols for Paediatric Ophthalmology Outpatient Clinics (POOCs)* (Attachment 6). The *StEPS Referral Form for POOCs* is at Attachment 7.

5 TRAINING

5.1 StEPS Training Package

To be certified as competent, vision screening staff must:

- satisfactorily complete modules one and two of the *StEPS Training Package* through the NSW Health Education and Training Institute (HETI).

- complete a minimum of four hours practical experience at a screening location (with the StEPS Coordinator or an Orthoptist if possible).
- be assessed as competent after three months of screening using the *StEPS Competency Checklist for Vision Screeners* (Attachment 8) and annually thereafter.

5.2 Supervision and Professional Development

Following completion of modules one and two, in addition to supervised practical experience, ongoing professional development and mentoring opportunities for vision screeners should be locally arranged by LHDs as appropriate. This may involve opportunities to work with an experienced vision screener for the first three months of vision screening wherever possible; participation in Orthoptic clinics; and/or other professional development opportunities identified by the LHD.

It is the responsibility of the StEPS Coordinator to ensure that all dedicated StEPS vision screening staff, and all LHD staff who undertake StEPS vision screening, are proficient in undertaking a StEPS vision screen prior to being deemed qualified to undertake a StEPS vision screen unsupervised.

Ongoing supervision and performance management of vision screening staff, and other health staff who provide StEPS vision screening, is to be undertaken by LHDs according to LHD protocols. This should include performance reviews of vision screening staff referral rates and where appropriate, actions undertaken to address performance factors and skill development.

6 GLOSSARY OF TERMS

Adnexa
For the purposes of this document, adnexa refers to the appendages of the eye. These include but are not limited to the eyelids, conjunctiva, lacrimal apparatus and orbit.

Amblyopia
Amblyopia is reduced or 'dim' vision in an eye which appears to be normal. It is sometimes called 'Lazy Eye'. This is a serious eye defect which often goes undetected in childhood. If amblyopia is not diagnosed and treated early, the vision in the affected eye may be permanent and cannot be corrected with glasses or surgery.

Eye Health Professional
For the purposes of this document, an *Eye Health Professional* refers to registered ophthalmologists, orthoptists and optometrists.

Refractive Error
A refractive error occurs when the shape of an eye is abnormal or does not bend (or refract) light properly, which results in blurred vision. The three most common refractive errors are myopia (short sightedness), hyperopia (long-sightedness) and astigmatism.

HOTV logMAR chart
A visual acuity screening chart used in the StEPS program. LogMAR charts feature the same number of letters on each line, which progressively reduce in size according to a geometrical progression.

Sheridan Gardiner Linear Chart
A visual acuity screening chart used in the StEPS program. Linear charts feature an increasing number of letters on each line, which linearly reduce in size.

Visual Acuity
Visual acuity refers to the measurement of the eye's capacity to see an object, for example a letter on a vision chart, at a certain distance. This measurement is taken one eye at a time with the child wearing their correcting glasses or contact lenses (when needed). It is usually recorded in a format that compares the child's vision results to a certain standard.

Visual Acuity Screening
Also referred to as vision screening, this is the testing of visual acuity using pass/fail criteria to a specific standard correlated to an age appropriate level of acceptable vision.

Vision Surveillance
Vision surveillance is defined as the monitoring of vision development for signs of eye or vision problems and includes observation, family history, reported visual behaviours and some vision tests, e.g. corneal reflections, ocular movements and response to occlusion.

PAEDIATRIC PROCEDURAL SEDATION - GUIDE FOR EMERGENCY DEPARTMENTS, WARDS, CLINICS AND IMAGING (GL2018_011)

PURPOSE

Paediatric Procedural Sedation - Guide for Emergency Departments, Wards, Clinics and Imaging provides direction to clinicians and is aimed at achieving the best possible paediatric care in all parts of the state. The guide was prepared for the NSW Ministry of Health by an expert clinical reference group.

KEY PRINCIPLES

This guide applies to all facilities where paediatric patients are managed. It requires the Chief Executives of all Local Health Districts and Speciality Health Networks to determine where local adaptions are required or whether it can be adopted in its current format in hospitals and facilities required to manage procedural sedation of paediatric patients.

This guide reflects what is currently regarded as a safe and appropriate approach to the management of procedural sedation for paediatric patients. However, as in any clinical situation there may be factors which cannot be covered by a single guide. This document should be used as a guide, rather than as a complete authoritative statement of procedures to be followed in respect of each individual presentation. It does not replace the need for the application of clinical judgement to each individual presentation.

USE OF THE GUIDELINE

Chief Executives must ensure:

- This guide is adopted or local procedures are developed based on the Paediatric Procedural Sedation Guide for Emergency Departments, Wards, Clinics and Imaging.
- Local protocols are in place in all hospitals and facilities likely to be required to manage paediatric patients requiring procedural sedation
- Ensure that all staff treating paediatric patients are educated in the use of the locally developed paediatric protocols.

Directors of Clinical Governance are required to inform relevant clinical staff treating paediatric patients of this revised guideline.

This Guideline and the attachements are available at:
https://www1.health.nsw.gov.au/pds/Pages/doc.aspx?dn=gl2018_011

NEW STREET SERVICE POLICY AND PROCEDURES (PD2018_035)

PURPOSE

This Policy specifies the procedures and minimum standards for delivering New Street Services, and sets out the NSW Health framework for effective clinical practice in responding to children and young people with harmful sexual behaviours and their carers.

MANDATORY REQUIREMENTS

This Policy requires that New Street Services:

- prioritise the safety and wellbeing of young people who have been sexually harmed and those who are potentially at risk
- facilitate access to treatment for eligible families and caregivers of children and young people aged between 10 and 17 years who have engaged in harmful sexual behaviour, with priority given to those aged between 10 and 14 years, Aboriginal children and children with complex needs
- deliver services in ways which minimise harm
- integrate with NSW Health Violence Abuse and Neglect services, particularly Sexual Assault Services
- collaborate with interagency partners at local and district levels
- operate under a Service Agreement between the Local Health District in which the New Street service is located and the Sydney Children's Hospital Network, to receive clinical direction, advice and support
- comply with New Street staffing profiles as set out in the New Street Service Policy and Procedures
- deliver services in a culturally safe way
- participate in the New Street Advisory Committee
- apply the clinical processes and practices set out in the New Street Service Policy and Procedures
- comply with NSW Health Violence Abuse and Neglect Service Standards.

IMPLEMENTATION

Chief Executives are responsible and accountable for:

- establishing mechanisms to ensure the directives and requirements of the New Street Service Policy and Procedures are applied, achieved and sustained
- ensuring that NSW Health staff understand and are aware of their obligations in relation to the New Street Service Policy and Procedures and related policies and procedures
- ensuring resources are available to deliver and meet the directives and requirements of the New Street Service Policy and Procedures
- ensuring that NSW Health staff are trained to operationalise and implement the New Street Service Policy and Procedures
- communicating with the Ministry of Health through the Prevention and Response to Violence, Abuse and Neglect (PARVAN) Unit on reporting, communications and performance in relation to the New Street Service Policy and Procedures
- ensuring NSW Health staff are advised that compliance with the New Street Service Policy and Procedures is part of their patient / client care responsibilities.

New Street managers are responsible for:

- ensuring the requirements of the New Street Service Policy and Procedures are disseminated and implemented in their service
- monitoring implementation and compliance with the New Street Service Policy and Procedures.

NSW Health workers are responsible for:

- implementing and complying with the directives and requirements of the New Street Service Policy and Procedures.

This policy and the procedures are available at:
https://www1.health.nsw.gov.au/pds/Pages/doc.aspx?dn=pd2018_035

321(21/09/18)

PASTEURISED DONOR HUMAN MILK FOR VULNERABLE INFANTS
(PD2018_043)

PURPOSE

NSW Health is committed to the safe, equitable and ethical provision of pasteurised donor human milk (PDHM) to vulnerable infants in Neonatal Intensive Care Units (NICU).

Vulnerable infants refer to those infants at an increased risk of necrotising enterocolitis. This includes preterm infants, very low birth weight infants and other infants assessed as clinically high risk.

A partnership between NSW Health and the Australian Red Cross Blood Service (ARCBS) has been established in order to provide PDHM to these infants through the 'NSW Health Agreement for Pasteurised Donor Human Milk'. PDHM is supplied to NICUs on a cost-recovery basis.

This Policy supports mothers of vulnerable infants to optimise lactation; to supplement breast milk feeding of vulnerable infants with PDHM when mothers own milk is insufficient and ensure access to PDHM is equitable across NSW and in accordance with clinical need.

Only facilities with NICUs are eligible to receive PDHM. This Policy outlines the responsibilities of local health districts (districts) and Sydney Children's Hospital Network (SCHN) NICUs who choose to participate in the provision of PDHM to vulnerable infants under the NSW Health Agreement.

MANDATORY REQUIREMENTS

To receive PDHM districts and SCHN must:

- Implement the attached, Pasteurised Donor Human Milk for Vulnerable Infants Protocol (the Protocol)
- Ensure they have sufficient resources to meet the requirements of this service.
- Ensure each ARCBS Milk Bank Coordinator complies with:
    - NSW Health Occupational Assessment, Screening and Vaccination Against Specified Infectious Diseases policy.
    - NSW Health Code of Conduct.
    - National Criminal Record completed by ARCBS and sighted by facility.
    - Local orientation procedures.

321(27/11/18)

- Support donor recruitment within their facilities.
- Provide appropriately trained staff to ensure that adequate ongoing lactation support is offered, and that NICU breastfeeding rates on discharge are optimal.
- Provide facility-specific data for the purpose of quarterly performance monitoring in accordance with Section 1.6 in the Protocol.
- Coordinate the management of reactive serology screening results for hospital-based donors as per Appendix 1 in the Protocol.

IMPLEMENTATION

The districts/SCHN Chief Executives or delegated officers must ensure the NICUs undertake the following actions:

- All NICU staff are made aware of the Policy and Protocol.
- Appoint an authorised person to act as the 'Agency Contract Manager', as outlined in Section 14 in the Protocol, who will also be the point of contact for supply management in case of PDHM shortage.
- Key personnel are made aware of their responsibilities in the Protocol.
- Designated lead to develop local guidelines to support the implementation of the Policy and Protocol.

Supply of PDHM to NICUs during a shortage is determined by the principles of state-wide equity, with state-wide eligibility being determined as per the attached Protocol and not by the individual NICU. The monitoring reports will be compiled quarterly by the Health and Social Policy Branch, Strategy and Resources Division, Ministry of Health. These reports will be provided to the PDHM Governance Committee and Clinical Advisory Group for review.

Documentation of ARCBS Milk Bank Coordinator compliance with NSW Health policy and Code of Conduct can be performed at one site and these documents shared with other relevant sites to streamline credentialing processes in NSW.

Other relevant NSW Health Policies are:

- Breastfeeding in NSW: Promotion, Protection and Support
- Breast Milk: Safe Management

This policy and the Pasteurised Donor Human Milk for Vulnerable Infants – NSW Health and Australian Red Cross Blood Service Partnership Service Protocol is available at:

https://www1.health.nsw.gov.au/pds/Pages/doc.aspx?dn=pd2018_043

FIRST 2000 DAYS FRAMEWORK (PD2019_008)

PURPOSE

The First 2000 Days Framework (the Framework) is a strategic policy document which outlines the importance of the first 2000 days in a child's life (from conception to age 5) and what action people within the NSW health system need to take to ensure that all children have the best possible start in life.

MANDATORY REQUIREMENTS

Local Health Districts and Speciality Health Networks will ensure that strategies to implement the First 2000 Days Framework appear within their local plans, commencing by 1 July 2019.

Local Health Districts and Specialty Health Networks will provide an annual report, on request, to the NSW Ministry of Health on progress against their implementation plan.

IMPLEMENTATION

Local Health Districts and Specialty Health Networks have lead responsibility for implementing the Framework within their district or network. They are to use the information provided in the Framework about the first 2000 days and opportunities for action to inform local priority setting and planning against the Framework's strategic objectives. The three objectives of the Framework are:

1. All staff in the NSW health system understand and promote the importance of the first 2000 days and the best opportunities for action
2. The NSW health system provides care to all and works in partnership to promote health, wellbeing, capacity and resilience during the first 2000 days
3. The NSW health system provides additional services for those who need specialised help, when they need it.

NSW Ministry of Health, will support implementation of the Framework. The Branch will monitor implementation through annual reports that will be requested from Local Health Districts and Speciality Health Networks about progress towards priorities in their local plans.

This policy and the First 2000 Days Framework are available at:
https://www1.health.nsw.gov.au/pds/Pages/doc.aspx?dn=pd2019_008

321(08/02/19)

FIRST 2000 DAYS IMPLEMENTATION STRATEGY (IB2021_011)

SUMMARY

The NSW Health First 2000 Days Implementation Strategy was developed to assist Local Health Districts and Specialty Health Networks in implementing the First 2000 Days Framework, including providing information to assist them in developing their local plans.

This information bulletin and the Frist 2000 Days Implementation Strategy are available at:
https://www1.health.nsw.gov.au/pds/Pages/doc.aspx?dn=IB2021_011

336(23/03/21)

MATERNITY - MANAGEMENT OF MONOCHORIONIC TWIN PREGNANCY (GL2020_011)

PURPOSE

This Guideline provides best practice guidance to clinicians caring for women with monochorionic (MC) twin pregnancies. It promotes consistent recognition, monitoring, reporting, management and appropriate referral within the tiered NSW Maternity and Neonatal (Perinatal) Networks to optimise fetal and maternal wellbeing.

KEY PRINCIPLES

This Guideline applies to all NSW Public Health Organisations (PHOs) providing maternity services. The Guideline:
 endorses the Royal Australian and New Zealand College of Obstetrics and Gynaecology (RANZCOG) recommendations for MC twin pregnancies (see Section 2)
 recommends that women with MC twin pregnancies require as a minimum, antenatal care from a Level 4 maternity service in consultation with a Level 5 or 6 maternity service, and planned birth at a Level 5 or 6 maternity service in line with *NSW Maternity and Neonatal Service Capability Framework* GL2016_018 (see Section 1.6)
 defines minimum standards for the frequency of ultrasound scanning and ultrasound reporting for women with a MC twin pregnancy (see Section 2.2 and Appendix 1)
 recommends all Tiered Perinatal Networks have an agreed pathway to communicate ultrasound scan results between ultrasound departments and maternity care providers in line with *Tiered Networking Arrangements for Perinatal Care in NSW* PD2020_014 (see Section 1.6).

USE OF THE GUIDELINE

Chief Executives of Local Health Districts are responsible for:

- ensuring appropriate referral, escalation and transfer of care for women with MC twin pregnancies in line with this Guideline and *NSW Maternity and Neonatal Service Capability Framework* GL2016_018 (see Section 1.6)
- developing local referral to and reporting pathways for appropriate obstetric ultrasound providers with capability to assess a twin pregnancy (see Section 1.5)
- monitoring and review of outcomes for women diagnosed with MC twin pregnancy (see Section 6).

The Maternity - Management of Monochorionic Twin Pregnancy Guideline can be downloaded at https://www1.health.nsw.gov.au/pds/Pages/doc.aspx?dn=GL2020_011

MANAGEMENT OF POSITIONAL PLAGIOCEPHALY BY ALLIED HEALTH PROFFESIONALS (GL2020_013)

GUIDELINE SUMMARY

The Guideline was developed to provide best practice guidance for management of infants with positional plagiocephaly.

The objectives of the Guideline are to:

- assist clinicians working in primary and secondary health service areas with early detection and assessment and of infants with positional plagiocephaly
- provide clinicians with best practice guidance for management of infants diagnosed with positional plagiocephaly
- provide clinicians with best practice guidance for referral of infants with positional plagiocephaly to tertiary services (e.g. Craniofacial–Helmet clinic).

KEY PRINCIPLES

The Guideline should be used in conjunction with the *Physiotherapy management of plagiocephaly* eLearning module available through the NSW Health Education and Training Institute (HETI) online learning portal, My Health Learning.

Key principles for the Guideline are outlined further in Section 1.3. The Guideline is one component of clinical decision making and provides a guide for best practice for clinicians working with infants with suspected or diagnosed positional plagiocephaly.

USE OF THE GUIDELINE

Chief Executives must:

- ensure that the Guideline is adopted and that local policies based on the Guideline are in place in all hospitals and facilities likely to be required to care for children with positional plagiocephaly.

Directors of Clinical Governance are required to:

- inform relevant clinical staff treating paediatric patients of this guideline
- ensure that all staff treating infants are educated and supported in the use of the locally developed protocols for referral and management of positional plagiocephaly.

The Management of Positional Plagiocephaly by Allied Health Professionals Guideline can be downloaded at https://www1.health.nsw.gov.au/pds/Pages/doc.aspx?dn=GL2020_013

CLINICAL DETERMINATION FOR BOARDER BABY REGISTRATION (GL2020_020)

GUIDELINE SUMMARY

This Guideline clarifies when a neonate (a baby up to 28 days of age) is required to be registered in the **Patient Administration System (PAS)** as a boarder. It sets out the responsibilities for the assessment and care of neonates who are accommodated in a NSW Public Health Organisation (PHO) to ensure patient safety and quality care.

KEY PRINCIPLES

- A neonate less than 10 days of age who is in hospital cannot be registered as a 'boarder'. Neonates under 10 days of age who remain in hospital or return to hospital because the caregiver (usually the mother) is unwell must be an admitted patient.
- A neonate 10 or more days of age **not requiring clinical care**, may be a boarder when accompanying the caregiver who is an admitted patient. In this case the neonate is not an admitted patient and should be registered as a boarder.
- A neonate in a PHO must have a clinical assessment by an appropriate medical officer prior to admission or registration as a boarder.
- Regardless of the admission status all neonates should have two identification bands in place preferably on each ankle.
- Care planning for the neonate should be individualised and take into consideration the caregiver's clinical condition, physical and mental health, the impact of treatment on the caregiver's capacity to care for the neonate, and any additional supports required for the family,
- Any neonate, irrespective of age, whose caregiver (or sibling of the same multiple birth) is admitted for treatment of sepsis, must be physically assessed, investigated where appropriate and monitored for sepsis. A neonate in these circumstances would usually be admitted and should not be registered as a boarder.
- Wherever possible caregivers and neonates should not be separated. Support, protection and promotion of breastfeeding is essential.

LOCAL HEALTH DISTRICT RESPONSIBILITIES

Local health districts are responsible for developing local Guidelines, pathways and resources to ensure:

- neonates receive appropriate care in an appropriate place
- assessment, care and care planning is documented
- correct registration of all neonates in the PAS

The Clinical Determination for Boarder Baby Registration Guideline can be downloaded at https://www1.health.nsw.gov.au/pds/Pages/doc.aspx?dn=GL2020_020

SYPHILIS IN PREGNANCY AND NEWBORNS (PD2023_029)

POLICY STATEMENT

NSW Health is committed to addressing concerning increases in the number of women diagnosed with syphilis in pregnancy (maternal syphilis) and mother-to-child transmission of syphilis (congenital syphilis) resulting in adverse outcomes including preterm birth, low birth weight, congenital anomalies, fetal loss or stillbirth, and neonatal death. Congenital syphilis is an entirely preventable disease and its occurrence reflects a failure of delivery systems for antenatal care and syphilis control programs.

SUMMARY OF POLICY REQUIREMENTS

This Policy Directive introduces new antenatal syphilis screening intervals for all pregnant women, and outlines Local Health Districts (Districts), Specialty Health Networks (Networks) and service level responsibilities to ensure appropriate referrals, assessment and management of syphilis in pregnancy and neonates.

This Policy Directive must be read as a supplement to existing gold-standard clinical guidance outlined in the current edition of the Australasian Society for Infectious Diseases (ASID) guidelines Management of Perinatal Infections.

Assessment, diagnosis, and treatment of maternal and congenital syphilis is multifaceted and requires a multidisciplinary response. Leadership at Districts and Networks must ensure that local processes are in place to enable effective implementation of this Policy Directive including identified referral pathways and responsibilities for follow-up of women at risk of syphilis in pregnancy, and pregnant women diagnosed with syphilis in pregnancy.

All pregnant women in NSW must be offered syphilis screening as part of their first antenatal visit blood screen and again at 26-28 weeks gestation. Pregnant women who have received minimal or no antenatal care, or are at risk of missing an appointment, should be opportunistically screened for syphilis and blood-borne viruses Hepatitis B and HIV at the service they present at, regardless of gestation. Documentation of all antenatal syphilis screening must be entered into the relevant District maternity database and medical records.

All positive syphilis results in pregnancy should be discussed with a clinician who has expertise in managing and treating syphilis. Local pathways must be developed to ensure pregnant women are referred to maternity services, and all relevant services are informed including sexual health services, the local public health unit and primary care services to facilitate appropriate contact tracing and treatment where relevant.

Timely assessment and initiation of treatment is essential for all cases of maternal syphilis per the Australasian Society for Infectious Diseases (ASID) guidelines Management of Perinatal Infections. All pregnant women diagnosed and treated for syphilis in pregnancy need the details of their investigations and management, and recommendations for future testing requirements clearly documented in their medical records. Local pathways must be developed to ensure maternal and neonatal assessment is clearly documented in the patient's medical record in a manner that ensures this is flagged at the time the pregnant women presents for birth.

Responsibility for neonatal follow-up must be clearly defined on discharge identifying the most appropriate service as relevant to the local context and woman's needs (such as paediatric outpatient clinic or outreach service). Auditing processes must be developed to monitor and review follow-up care and clinical outcomes.

All cases of congenital syphilis are to be investigated as a clinical incident and entered into the Incident Management System (ims+) with a harm score relevant to the case. NSW Health employees must be aware of the importance of reporting incidents and near misses to ensure timely investigation and ensure lessons are learnt to facilitate the elimination of congenital syphilis in NSW

The complete Syphilis in Pregnancy and Newborns policy is available at https://www1.health.nsw.gov.au/pds/Pages/doc.aspx?dn=PD2023_029

TABLE OF CONTENTS

CHAPTER 3 – CHAPLAINCY SERVICES	PD/IB/GL NUMBER
NSW Health & Civil Chaplaincies Advisory Committee NSW Memorandum of Understanding	PD2011_004
Chaplaincy Services and Privacy Law	IB2008_044

NSW HEALTH & CIVIL CHAPLAINCIES ADVISORY COMMITTEE NSW MEMORANDUM OF UNDERSTANDING (PD2011_004)

PD2011_004 rescinds PD2005_123.

PURPOSE

This policy sets out the privileges and requirements for accredited chaplains to provide chaplaincy and pastoral care services in the NSW Health System. The process for appointment and accreditation of chaplains is provided, as well as a description of the duties which accredited chaplains typically undertake. Privacy and patient confidentiality issues are addressed, and chaplaincy terms are clearly defined. Associated funding and financial agreements are also addressed together with the obligations of NSW Health, the Civil Chaplaincies Advisory Committee (http://www.ccacnsw.org.au) and their member religious organisations.

MANDATORY REQUIREMENTS

Health Service Chief Executives and other NSW Health Agencies should have effective systems and procedures in place in order to make sure that the provision of chaplaincy and pastoral care services are managed according to the requirements set out in the memorandum of understanding.

IMPLEMENTATION

Health Network Chief Executives and other NSW Health Agencies are to ensure that the requirements of this policy are communicated to all the appropriate staff (including Hospital Chaplaincy Coordinators, Privacy Contact Officers, Hospital Accredited Chaplains and Pastoral Care Workers, Hospital Administration, Clinical/Patient Services and Social Workers.

The CCAC will facilitate the distribution of the policy and its obligations on behalf of its member organisations.

1. Introduction and background to the NSW Health & Civil Chaplaincies Advisory Committee NSW Memorandum of Understanding (PD2011_004)

2. NSW Health & Civil Chaplaincies Advisory Committee NSW Memorandum of Understanding (PD2011_004)

CHAPLAINCY SERVICES AND PRIVACY LAW (IB2008_044)

Introduction

This Information Bulletin replaces PD2005_412 *Chaplaincy Services and Privacy Law* and complements PD2011_004 *NSW Health & Civil Chaplaincies Advisory Committee NSW Memorandum of Understanding*.

This Information Bulletin and PD2011_004 *NSW Health & Civil Chaplaincies Advisory Committee NSW Memorandum of Understanding* both support the role of chaplaincy services in the NSW public health system. Chaplaincy services are considered an important part of the health support services provided through hospitals and other health facilities to patients and their families.

Questions have arisen as to whether provision of information to hospital chaplains is within the terms of NSW privacy law, particularly given the additional restrictions imposed by privacy laws on access to information about religious and philosophical beliefs.

A regulation has therefore been made under the *Health Records and Information Privacy Act 2002* to clarify the situation in relation to the provision and use of information for NSW Health chaplaincy services, and to provide a sound legal basis for information sharing with chaplaincy services in the NSW Health system.

The regulation is entitled *Health Records and Information Privacy Amendment (Accredited Chaplains) Regulation 2008*.

This Information Bulletin provides guidance to NSW Health accredited chaplains and NSW Health staff as to the operation of the regulation.

This Information Bulletin will become effective on the date of commencement of the regulation which is 1 October 2008.

How will the regulation work?

The regulation recognises that chaplaincy services form part of the health services available at a hospital or health facility.

It allows information to be released to a chaplain provided that release is for the purposes of chaplaincy services and the release is within the reasonable expectation of the patient or other person to whom the information relates.

Patient consent for release of personal information to accredited chaplains is not required under the regulation. Consequently it is not necessary to include a consent question in admission procedures or on admission forms.

It is important to recognise:

- Access to information under the regulation is limited to accredited chaplains, that is chaplains who have been accredited by the Chief Executive of the public health organisation through PD2011_004;
- The test that the disclosure is within "the reasonable expectation" of the patient is the same test applied in relation to the sharing of information for the purposes of providing ongoing medical care. To support compliance:
  - steps should be in place to ensure that patients are aware that information will be provided to a hospital's chaplaincy department or chaplaincy services;
  - where a patient indicates they do not wish information to be provided, steps should be taken to ensure these views are complied with.
- Accredited chaplains are routinely provided with the name and religious faith or denomination of patients. When necessary, accredited chaplains may also be provided with additional personal and health information to enable the chaplain to fulfil his or her duties in a manner which is within the patient's reasonable expectation or that of the patient's relatives.

The Information Privacy Leaflet for Patients has been revised to include reference to chaplaincy services (see http://www.health.nsw.gov.au/utilities/privacy/patient.asp). Health services have developed local Information Privacy Leaflet for Patients based on this. Facilities may also have local information and brochures on chaplaincy services which can be used for this purpose.

Compliance with *Health Records and Information Privacy Act 2002*

The regulation means that accredited chaplains will now be covered by the *Health Records and Information Privacy Act* in relation to the information they obtain from hospitals and hospital chaplaincy services.

This means chaplaincy services will need to comply with certain requirements under privacy law in relation to access and retention of records. For assistance with these requirements, accredited chaplains should refer to the 'Information Sheet for Accredited Chaplains: Compliance with the *Health Records and Information Privacy Act 2002'* which can be found on the NSW Health privacy website: http://www.health.nsw.gov.au/utilities/privacy/info_chaplains.asp.

Public health organisations are encouraged to use their Chaplaincy Services Steering Committee to establish local protocols and procedures for communication between hospital staff and accredited chaplains and to provide support for chaplaincy services in complying with the terms of the *Health Records and Information Privacy Act* and the regulation. Where no Chaplaincy Services or Pastoral Care Department exist in a public health organisation, a process of accreditation of local clergy or religious leaders should be established through the Human Resources Department or equivalent personnel office.

ELIGIBILITY OF PERSONS FOR PUBLIC ORAL HEALTH CARE IN NSW (PD2017_027)

PD2017_027 rescinds PD2016_050

PURPOSE

This Policy Directive establishes the eligibility criteria for NSW residents who wish to access NSW Health public oral health services.

MANDATORY REQUIREMENTS

Public Oral Health Services managed by NSW Local Health Districts (LHD) must provide oral health care to persons who meet the eligibility criteria set out in this document.

At each appointment, staff of NSW Public Oral Health Services must ensure a person meets the eligibility criteria set out by this document prior to providing care.

IMPLEMENTATION

The NSW Ministry of Health is responsible for ensuring the requirements of this policy and attached procedures are monitored and acted on accordingly, and that the eligibility criteria are openly communicated to the public.

LHD Chief Executives are responsible for ensuring the public oral health services in their LHD provide oral health care to eligible persons in accordance with this document.

Oral Health Managers, **Clinical Directors** and **staff of public oral health services** are responsible for ensuring compliance with the eligibility criteria set out in this policy and attached procedures, and that the eligibility criteria are openly communicated to the public.

This Policy Directive should be read in conjunction with the following NSW Health policies:

- Priority Oral Health Program and Waiting List Management
- Oral Health Fee for Service Scheme (OHFFSS)
- Oral Health Specialist Referral Protocols
- Oral Health Chart & Referral Form for Medical Emergency Departments

1 BACKGROUND

1.1 About this document

NSW Public Oral Health Services provide a range of dental care services through funding provided or managed by the NSW Government. To ensure available resources are used efficiently, NSW Health limits access to these services to those populations at higher risk of dental disease or who are less able to afford dental care through private providers. This is achieved through the setting of eligibility criteria through this Policy Directive.

Section 2 sets out the criteria for a person to be eligible to receive dental care through NSW Public Oral Health Services. Public Oral Health Services managed by NSW Local Health Districts (LHDs) must provide oral health care to persons who meet these criteria.

Staff of NSW Public Oral Health Services must ensure a person meets the eligibility criteria set out by this document prior to providing care (section 2.3).

Section 3 provides additional detailed information on how staff from public oral health services should manage the delivery of patient care. It provides information on variations and exceptions to eligibility criteria, including patients admitted to hospital for other health care, ineligible patients, and patients who are accessing care outside their LHD.

The NSW Ministry of Health is responsible for ensuring the requirements of this policy are monitored and acted on accordingly, and that the eligibility criteria are openly communicated to the public (section 4).

LHD Chief Executives are responsible for ensuring the public oral health services in their LHD provide oral health care to eligible persons in accordance with this document.

Oral Health Managers, **Clinical Directors** and **staff of public oral health services** are responsible for ensuring compliance with the eligibility criteria set out in this policy and that the eligibility criteria are openly communicated to the public (section 4).

1.2 Key definitions

An episodic course of care is defined as a limited course of care provided with the intent of only addressing a specific, clinically urgent presentation.

An oral health emergency is defined as a child or adult patient categorised as Priority 1 through the PD2017_023 *Priority Oral Health Program and Waiting List Management* policy directive triage. Dental pain by itself is not considered an oral health emergency.

2 ELIGIBILITY

2.1 Eligibility of Adults for Non-admitted Oral Health Care Services

For an adult to be eligible for free public oral health services they must:

- Be normally resident within the boundary of the providing LHD , **and**
- Be eligible for Medicare, **and**
- Be 18 years of age or older, **and**
- Hold, or be listed as a dependent on, one of the following valid Australian Government[1] concession cards:
  - ⇒ Health Care Card
  - ⇒ Pensioner Concession Card
  - ⇒ Commonwealth Seniors Health Card.

Note that holders of the State Seniors Card are not eligible for care unless they also hold one of the other concession cards listed above.

2.2 Eligibility of Children and Young Persons for Non-admitted Oral Health Care Services

For a child or young person to be eligible for free public oral health services they must:

- Be normally resident within the boundary of the providing LHD , **and**
- Be eligible for Medicare, **and**
- Be less than 18 years of age.

Additional eligibility criteria may apply for some specialist oral health care. These are detailed in the Oral Health Specialist Referral Protocols.

[1] Includes Centrelink and the Department of Veterans Affairs.

2.3 Confirmation of Eligibility

At each visit the patient is responsible for proving their eligibility prior to receiving treatment, by showing a valid Medicare card and, for adults, a valid concession card. Electronic versions of cards may be used through the Centrelink mobile app on a smart phone.

If a valid concession card cannot be produced, the patient must seek a temporary concession card to establish that they are eligible for treatment, except where the person requires emergency treatment (as defined in Section 1.2).

The patient may also be asked to produce secondary identification such as a drivers licence to confirm their identity. A formal letter of identification from a homelessness agency is also acceptable as a secondary identification.

Where programs exist that involve partnerships and referral pathways between Oral Health Services and Aboriginal Community Controlled Health Services or LHD Aboriginal Service, LHDs may apply discretion to waive eligibility requirements for the clients of these programs. This may also be extended to client's partners and children.

3 PATIENT CARE

3.1 Inter-district agreements

Due to funding and reporting arrangements, dental care will normally be provided by the LHD in which a patient lives. However, LHD's may have inter-district arrangements that allow for patients to receive care in a bordering LHD to facilitate accessibility to an appropriate service.

3.2 Admitted or Day Only Oral Health Care Patients.

Where a patient's oral health treatment requires them to be treated as an inpatient, they may be treated as:

- Non Chargeable Patients
- Compensable Patients
- Private Patients.

Standard LHD procedures for processing and charging patients should be followed, in accordance with Section Two of the NSW Health Fees Procedures Manual.

3.3 Patients Admitted for Other than Oral Health Treatment

Free oral health care will only be provided to adult patients admitted for care other than oral health treatment where:

- The oral health treatment is an emergency (as defined in Section 1.2), or
- The oral health treatment is an essential part of the surgical or medical management of the patient, and
- They hold, or are a listed dependent of the holder of, a current concession card (see section 2).

Treatment of hospital inpatients referred for oral health care will be negotiated with the LHD oral health clinical director if the oral health treatment is not an intrinsic part of their medical treatment. Patients who do not hold, or are not listed dependents on, a current concession card may be charged for services. The treatment sought will need to be prioritised in adherence with current LHD and NSW Health prioritisation policies for access to public oral health care.

Note that private admitted patients must pay for oral health care provided.

3.4 Services Provided to Ineligible Patients at Oral Health Clinics or at an Emergency Department

Persons not meeting the eligibility criteria set out above, including interstate visitors, may receive emergency treatment only and should see their own private general dental practitioner for all other treatment. Emergency treatment (as defined in section 1.2) may be provided to such patients who present at either a public oral health clinic or at a hospital emergency department.

Unless covered by an inter-district agreement, residents of NSW who are outside of their LHD of residence, but are otherwise eligible for free public oral health care, should only be provided with an episodic course of care (as defined in Section 1.2) and / or an Oral Health Fee For Service voucher if required. Additional dental care may be provided at the discretion of the clinical director, taking into account any additional personal circumstances of the patient.

In consultation with the patient, the LHD that provides this episodic care should make arrangements for the patient to receive any follow-up treatment required from the patient's LHD of residence.

Emergency oral health treatment and an episodic course of care (as defined in Section 1.2) may be provided to a person who is unable to prove eligibility because they are experiencing homelessness or are seeking asylum on humanitarian grounds. The person must be referred to the oral health service by an established agency and the requirement for proof of eligibility may be waived in these circumstances. Identification and treatment of these patients should be provided in accordance with PD2016_055 *Medicare Ineligible and Reciprocal Health Agreement – Classification and charging*

Compensable patients are to be charged at the compensable rate for an occasion of service (see Fees Procedures Manual). These patients should be advised that oral health treatment does not attract Medicare rebates and may not attract private health insurance rebates.

4 COMMUNICATION STRATEGY

Eligibility criteria and information on how eligible persons can access NSW Public Oral Health Services is made available through the NSW Health website at http://www.health.nsw.gov.au/oralhealth/Pages/eligibility.aspx.

The Centre for Oral Health Strategy, NSW Health has developed brochures that identify the eligibility criteria and process for accessing public dental care. The brochures that are available include; 'Public Dental Services', 'Oral Health Fee for Service Scheme', 'Child Dental Benefits Schedule Fact Sheet', Child Dental Benefits frequently asked questions'.

These brochures can either be downloaded from Centre for Oral Health Strategy website (http://www.health.nsw.gov.au/oralhealth/Pages/resources.aspx) or, alternatively, be ordered free of charge from Better Health Centre – Publications Warehouse 02 9887 5450

ORAL HEALTH FEE FOR SERVICE SCHEME (PD2016_018)

PD2016_018 rescinds PD2008_065

PURPOSE

This Policy Directive establishes a clear, patient focused, referral pathway that ensures a care management focus between public oral health services and private practitioners who participate in the scheme.

MANDATORY REQUIREMENTS

Local Health Districts and participating private dental businesses and practitioners must establish business rules that address the requirements in this policy's procedures and change from a paper based administration system to the NSW Health web-based administration system.

IMPLEMENTATION

The responsibilities of the key parties to ensure the mandatory requirements and standards of this policy are monitored and acted on accordingly.

Chief Executives:

Assign responsibility and personnel to implement the policy.

Oral Health Clinical Directors and Oral Health Managers:

Ensure timely and open communication to establish a patient focused outsourcing dental program with participating private practitioners.

All Local Health District Staff and contracted Private Dental Practitioners and Businesses:

Comply with the policy directive and actively participate in establishing efficient patient referral processes and effective dental care.

1 BACKGROUND

The Oral Health Fee for Service Scheme (Scheme) provides a framework by which Local Health Districts (LHDs) may engage private dental practitioners (practitioners) and associated dental businesses (businesses) to provide care to public oral health service patients.

This document provides an overview of the Scheme and outlines the processes for:

- Web based administration
- Approving businesses and practitioners to participate in the Scheme
- Utilisation and payment for services under the Scheme
- Terms and conditions, and
- Governance of the Scheme.

1.1 Key definitions

In this document the term:

- **Must** – indicates a mandatory action required that must be complied with.
- **Should** – indicates a recommended action that should be followed unless there are sound reasons for taking a different course of action.

The following is clarification of key terms used throughout the document:

Episodic dental care voucher	Is the voucher type for emergency or acute course of care that is associated with a limited examination (013).
General dental care voucher	Is the voucher type for a general course of care (excludes dentures) that is associated with a full examination (011).
Denture provision voucher	Is the voucher for full or partial dentures and is associated to a limited examination (013) for dentists and consultation (014) for dental prosthetists.
Business	Is a facility where dental services are rendered either by a single dental practitioner or a group of dental practitioners, and/or, a business purely associated with an ABN that has been identified as a place for payment of services.
Practitioner	Is a dental practitioner registered with the Dental Board of Australia in the appropriate division (dentist, dental therapist, dental hygienist, oral health therapist and dental prosthetist) under the Health Practitioner Regulation National Law http://www.dentalboard.gov.au/Registration.aspx
Clinical Director	Is an LHD/Speciality Network clinician who is employed as an Area Clinical Director Level 1 – 3, or is a LHD delegated senior clinician.

1.2 Regulatory and legislative framework

The regulatory and legislative framework within which this procedure operates is set out in the *Health Practitioner Regulation National Law (NSW)* (http://www.legislation.nsw.gov.au/maintop/view/inforce/act+86a+2009+cd+0+N), and further information in relation to the registration of practitioners can be sourced from the Dental Board of Australia and the Australian Health Practitioner Regulation Agency.

1.3 Related NSW Ministry of Health policies, guidelines and information bulletins

The implementation of this procedure should be read in conjunction with the following NSW Ministry of Health policy directives, guidelines and information bulletins as updated from time to time:

- Clinical Procedure Safety
- Complaint Management Policy
- Complaint or Concern about a Clinician - Management Guidelines
- Complaint or Concern about a Clinician - Principles for Action
- Complaints Management Guidelines
- Consent to Medical Treatment – Patient Information
- Employment Checks – National Criminal Record Checks and Working with Children Checks
- NSW Health Privacy Manual for Health Information
- OHFFSS Schedule of Fees
- Oral Health - Eligibility of Persons for Public Oral Health Services in NSW
- Oral Health Record Protocols
- Oral Health: Cleaning, Disinfecting and Sterilizing
- Priority Oral Health Program and Wait List Management

NSW Ministry of Health policy directive, guidelines and information bulletins are public documents and are available on their website. (http://www.health.nsw.gov.au/policies/pages/default.aspx)

2 SCHEME OVERVIEW

The Scheme allows LHDs to engage private businesses and practitioners to provide dental care for eligible child and adult patients that have requested care from the LHD directly. LHD representatives will issue a voucher to eligible patients. Vouchers can be redeemed by patients at a business approved to participate in the Scheme. Once the patient's treatment is completed, the business or practitioner, forwards the voucher to the LHD for payment. The principal of the business and practitioner agrees to a set price schedule and the terms and conditions as listed in the current OHFFSS Schedule of Fees. The Schedule of Fees is updated annually and is indexed against the Department of Veterans Affairs fee schedule for dental care - http://www.dva.gov.au/Pages/home.aspx.

2.1 Participating Practitioners

All dental practitioners registered with the Dental Board of Australia are encouraged to apply to be approved practitioners under the Scheme.

All dentists and oral health practitioners must only provide dental services within their scope of practice under the OHFFSS.

The LHD may indicate to the patient the practitioner type most suitable for the treatment required.

2.2 Service Types

The OHFFSS provides the opportunity for referred public dental patients to receive dental care through the following service types:

- Episodic care for children and adults
- General care for children and adults
- Dentures
- Domiciliary, and
- Specialist services such as oral surgery and periodontics.

2.3 OHFFSS Voucher

An OHFFSS voucher can only be provided through the Priority Oral Health Program triage questionnaire, which assesses the patient's oral heath need, or an authorised mechanism approved by NSW Health.

There are three types of vouchers that may be issued, these are:

1. Episodic care – The intent of this voucher is to address the most urgent treatment needs of a patient
2. General care – A voucher that covers comprehensive care identified by a full examination of a patient
3. Denture provision – A voucher that specifically includes denture care.

2.3.1 Voucher expiry timeframes

An OHFFSS voucher has an expiry date from the date of issue. The expiry timeframes for the three voucher types are:

- One (1) month for episodic care, and
- Three (3) months for general care and dentures.

2.4 Specific conditions related to the provision of dental treatment under the Scheme.

- The items claimable are restricted by the voucher type (refer to Point 2.3) and the Schedule of Fees.
- Generally dentures will be acrylic, unless specified by the LHD. If a patient wishes to have a chrome denture that is not specified or approved on the voucher, or any other additional feature, the business and/or practitioner may enter a private agreement with that patient to cover the additional expense.
- Dentures are to comply with the Therapeutic Goods Administration (TGA) Standards (http://www.tga.gov.au/).
- Surgical removal of tooth needs to be supported by a pre-surgical radiograph
- The provision of pulp extirpation and Root Canal Therapy (RCT) is limited to those vouchers where the need for this item is specifically recorded/authorised.
- The provision of orthopantomogram radiographs (OPGs) is limited to those vouchers where the need for this item is specifically recorded/authorised.

2.5 Recording of dental treatment provided under the Scheme.

The recording of dental care items for the Scheme is to be in accordance with the Australian Schedule of Dental Services and Glossary (http://www.ada.org.au/publications/schedule.aspx).

3 OHFFSS ADMINISTRATION PROCESSES

3.1 Web Based System

To participate in the Scheme a business and practitioner must agree to the OHFFSS conditions of access (Attachment A) and establish an electronic profile within the OHFFSS web based administration system (System) that is located at http://ohffss.health.nsw.gov.au/

This web based participation process is divided into two profile pathways - business and practitioner - each containing mandatory requirements (Point 5).

These two pathways support the process of the business profile allocating practitioner(s) to their services, nominating the service type and LHD(s) of their choice. The practitioner's profile independently maintains their contact details and relevant mandatory requirements (refer to Point 5).

Upon receipt of the mandatory information (refer to Point 5) and subsequent processing by the relevant LHD(s) and/or OHFFSS State-Wide Coordinator, all businesses and practitioners will be notified of their participation status as accepted or not accepted via a system email.

3.1.1 Conditions of Access

To start a business and practitioner profile, or to login as an existing participant, the conditions of access (refer to Attachment A) must be agreed to.

3.1.2 Conditions of Use

To access the System authorised LHD staff must agree to conditions of use (refer to Attachment B).

3.1.3 System Security

All business and practitioner information uploaded to the OHFFSS online profile will be stored securely and only authorised Local Health District staff, OHFFSS and Scheme administrators will have access to this information. Business and practitioner information will only be used and disclosed for the purposes of the OHFFSS.

The LHD must only allocate authorised staff to the System. The LHD must also ensure that any staff who have left the employment of the LHD have their profile to access the System made obsolete.

3.1.4 Confidentiality

To ensure confidentiality businesses and practitioners will only be able to view and edit their profile. Businesses and practitioners maintain responsibility for the username and password of their profile, including changing the password regularly and ensuring proper use and access.

Authorised LHD staff and OHFFSS State-Wide Coordinator must comply with NSW Health Privacy Manual for Health Information.

3.1.5 Finding a Participating Practitioner

The web-based System provides easy access for NSW residents and LHD staff to find a current participating OHFFSS practitioner, dental clinic contact details, type of service/s provided, scope of practice and other services such as languages spoken and disability access.

3.1.6 Mandatory Expiry Date Alerts

The System will send businesses and practitioners a reminder email twenty one (21) days, fourteen (14) days and seven (7) days prior to the expiry date, and on the expiry date of the mandatory requirements identified in Point 5.

If the associated information has not been updated, the business and/or practitioner name will be suspended from the OHFFSS and patient referrals will be postponed until this has been rectified. After 30 days from the expiry date the business and/or practitioner profile will be made obsolete. If this occurs the business and/or practitioner will be required to contact either the LHD or OHFFSS State-Wide Coordinator to reactivate their profile.

3.2 NSW Ministry of Health Caveat

NSW Health and/or the relevant LHD/s retain discretion with regards to accepting a business or practitioner for approval to the Scheme. A business or practitioner may be denied approval for a number of reasons, including and not limited to:

- Not providing the required documentation
- Concerns about service standards, or the practitioner’s registration with the Dental Board of Australia
- Infection control standards are inadequate and/or
- No demand for the Scheme in the geographical region where the practitioner or business are located.

3.3 Complaints and Disputes

Complaint/dispute handling processes are to follow NSW Ministry of Health policies and guidelines.

Complaints can be managed:

- At the point of service
- Through a staged process, or
- Through referral to an external body/agency or NSW Health OHFFSS Governance Committee (refer to Point 3.3.2).

If a dispute cannot be satisfactorily resolved or the business and/or practitioner does not comply with the terms and conditions of this policy NSW Health and/or the relevant LHD retain discretion to remove a business or practitioner from the Scheme.

3.3.1 Complaint/Dispute Issues

Complaint/dispute issues may include but are not limited to:

- Receipt of a complaint from a patient, family member or person external to the NSW Health System
- Complaints or concerns raised by other clinicians
- Coronial Inquiries or Health Care Complaints Commission (HCCC) investigations
- Investigation of an incident
- Concerns about questionable claims or the quality of care, or
- Compliance with Code of Conduct and Scope of Practice.

3.3.2 OHFFSS Governance Committee

The OHFFSS Governance Committee is to be established and will meet on an as needs basis to provide the following functions:

- Review clinical treatment procedures or manage waiting lists/times
- Provide a forum where issues can be discussed in a confidential manner
- Mediate unresolved disputes concerning the nature/quality or application of the OHFFSS
- Provide recommendations/actions for unresolved disputes to the Chief Health Officer and Chief Executives of LHDs, and
- To allow opportunities for a complainant to contact the Chair regarding their grievance.

The membership of this Committee consists of:

- A NSW Health Manager (Chair),
- NSW Chief Dentist
- An LHD Clinical Director
- One representative of the Australian Dental Association NSW Branch and/or the Australian Dental Prosthetists Association and/or the Australian Dental and Oral Health Therapists Association, as relevant to the issues being discussed, and
- A minimum of two community representatives.

3.4 Leave Notification

Businesses and practitioners may either withdraw or have periodic leave from the Scheme at any time by using the ‘leave request’ functionality in the System.

It is preferable to give two weeks written notice to the relevant LHD. Any outstanding claims must be forwarded to the relevant LHD(s) prior to their withdrawal date.

4 NSW HEALTH AND LOCAL HEALTH DISTRICT CONTACT DETAILS

4.1 OHFFSS State-Wide Coordinator

NSW Health provides a state-wide administration service for the implementation of the Scheme, complaints/dispute handling and support to businesses, practitioners and LHDs in relation to the System.

Contact details are:

Centre for Oral Health Strategy NSW
1 Mons Road, Westmead NSW 2145
Phone: 1800 938 133 (toll free)
Email: WSLHD-ohffss@health.nsw.gov.au
Fax: (02) 8821 4302.

4.2 Local Health Districts OHFFSS Coordinators

Each LHD employs an OHFFSS Coordinator whose role is to implement the Scheme and to respond to businesses or practitioners inquiries regarding clarification of patient dental history, patient's treatment, approval status or non-payment.

Contact details for LHD OHFFSS Coordinators can be located in the OHFFSS System or oral health call centre numbers at www.health.nsw.gov.au/oralhealth.

5 BUSINESSES AND PRACTITIONERS

5.1 Mandatory Participation Requirements

5.1.1 Businesses

- Company/Trading name
- Australian Business Number (ABN)
- Relevant bank details
- Certification of Public liability insurance to the value of $20 million*****
- Relevant Workers Compensation Insurance policy*****
- Radiation Management Licence***** (excluding Dental Prosthetists), and
- Completed Health Share vendor form*****. (http://www.healthshare.nsw.gov.au / or ring the Master File Maintenance Team on 1300 477 679 option)

5.1.2 Practitioners

- Australian Health Practitioner Regulation Agency (AHPRA) registration number and conditions of registration
- Certification of Professional indemnity insurance of $20 million*, and
- Working with Children Check number. (www.kidsguardian.nsw.gov.au)

Key: ***** indicates documents requiring uploading into the System.

5.2 Terms and conditions

5.2.1 Proof of Documentation

All mandatory documentation (*****) must be certified by an appropriately authorised person before being uploaded on the OHFFSS System.

5.2.2 Environmental Protection Agency

For those practitioners who offer OPGs under the Scheme, evidence of a current Environmental Protection Agency (EPA) licence (http://epa.nsw.gov.au/) will be required and uploaded into the OHFFSS System.

5.2.3 Maintaining Participation

To maintain approval to participate in the Scheme:

- Businesses must update their profiles on changes to: their contact and banking details; practitioner(s), service delivery type(s) and LHD(s); and the annual renewals of:
    - Public Liability Insurance certificate*
    - Workers Compensation Insurance policies*, and
    - Radiation Management Licence*.
- Practitioners must immediately update their profiles with any changes of their AHPRA registration status including AHPRA registration number and any conditions on registration; contact details; banking details (if applicable); and also the renewal of:
    - Professional indemnity insurance annually*, and
    - Working with Children Check (WWCC) every five (5) years.

5.2.4 Patient Care

All practitioners are required to:

- Review and be satisfied with the patient's medical history
- Review the treatment proposed (if provided) and if necessary to adjust the treatment plan according to the current condition, first consult with the LHD for approval
- Document the informed consent from the patient before carrying out any treatment that is covered by the voucher
- Complete all the required details of treatment provided on the voucher form (i.e. tooth number, surfaces, denture teeth replaced, and date of service)
- Ensure that the patient signs the voucher at completion of treatment verifying that they have received the treatment claimed, and
- Provide post-treatment instructions and any reasonable after care management.
- All practitioners understand they:
    - must fully discuss any treatment that is not covered by the voucher with the patient for which they will be charged (as part of a private agreement);
    - they may be asked to provide radiological evidence for all surgical extractions, and any pre-approved endodontic treatment;
    - they must provide at least three or more denture adjustments, as necessary, following the issue of a denture(s).

5.3 Businesses and Practitioners Joint Roles and Responsibilities

- All businesses and practitioners are required to:
    - Be compliant with current infection control standards (http://www.nhmrc.gov.au/guidelines-publications/cd33)
    - Cooperate with the LHDs in resolving complaints from patients and disputes about claims
    - Check that vouchers have not exceeded the expiry date and, if expired, contact the relevant LHDs prior to commencement of the treatment
    - Check the patient's identity, current Medicare Card, and Centrelink concession status if the patient is an adult before treatment is started

5.3.1 Processing of Vouchers

- To ensure payment the following must occur:
    - The patient must provide an original OHFFSS voucher that has been approved by a LHD (refer to Point 6)
    - The dental care outlined on the voucher must have been completed by the expiry date on the voucher, unless otherwise agreed with the LHD
    - All details of the voucher must be completed
    - The voucher must be forwarded to the LHD within 30 days after completion of treatment, and
    - The treatment must have been authorised by a LHD staff member.
- If payment is greater than the maximum entitlement, as identified in the Schedule of Fees, it must be approved by the LHD Manager or Clinical Director before the treatment is carried out
- If goods and services tax (GST) is to be claimed a tax invoice is to be submitted for processing as per LHD policy and procedures.
- Non-payment of a voucher may result if:
    - Dentures provided are non-compliant with TGA standards
    - There has been a surgical removal of a tooth that is not supported by a pre-surgical radiograph
    - A pulp extirpation has been provided where the voucher has specifically stated 'No Root Canal Therapy (RCT)'
    - The voucher is received after 30 days from the date treatment is completed
    - Treatment items have been provided after the voucher expiry date (unless prior authorisation has been obtained from the LHD)
    - Services have been provided by a business or practitioner not currently approved to participate in the OHFFSS
    - Treatment has been provided that is over and above that recommended
    - The treatment provided is not of a required standard, or
    - If treatment items used are not identified in the Schedule of Fees

6 LOCAL HEALTH DISTRICTS

6.1 Administration Requirements

Once a business or practitioner is approved in one LHD, other LHDs can engage that business or practitioner. Businesses and practitioners should therefore be advised that authorised officers from all LHDs and System administrators can access their profiles.

LHDs are required to:

- Use the OHFFSS System to process and communicate with private businesses and practitioners to approve participation in the Scheme
- Ensure that there is a designated employee who is responsible for the implementation of the Scheme
- Confirm via email that the business or practitioner has been approved to participate in the Scheme
- Ensure that all fields in the System have been completed
- Provide an explanation to the business or practitioner if they are not approved
- Request an Environmental Protection Agency (EPA) licence for those practitioners who have offered to provide OPGs
- Provide accurate and complete information to patients about the Scheme and the patient's right to choose an approved practitioner
- Issue voucher(s) with or without undertaking a clinical assessment
- Either post the voucher to the patient or hand to the patient at the time of the appointment
- If an initial appointment is not made for the patient by the LHD, the patient should be advised to make an appointment within ten working days
- Maintain a process of auditing and governing the efficient use of the Scheme, including periodic audits of relevant businesses and practitioners records. This auditing should encompass the following areas:
    - Financial accountability (errors of accounting and claiming) and
    - Clinical auditing (ensuring the quality of clinical care is within a reasonable standard and that accurate and complete medical records are kept for each patient and each visit).

Note that: NSW Health agencies may not apply for or pay for WWCCs on behalf of individuals (Section 5.3 Employment Checks – National Criminal Record Checks and Working with Children Checks PD 2013_028)

6.2 OHFFSS Voucher

The OHFFSS voucher is a combined authority, claim form, and treatment plan.

- The LHD must use the OHFFSS voucher that is required to have:
    - An oral health IT system unique ID authority number and bar code
    - Patient details
    - Date of issue
    - Maximum amount of the voucher as per Schedule of Fees, and
    - Treatment required (if applicable).

- The public dental practitioner should include on the voucher information relevant to the patient's clinical need:
    - Assessed treatment need and related tooth numbers,
    - Whether an OPG is authorised for the patient,
    - Number of teeth required for a denture, or
    - Indicate pre-prosthetic mouth preparation for clasps and rests if required.

6.2.1 Payment

- To ensure payment the following must occur:
    - Payment for one (1) diagnostic service per authorised voucher (episodic, general and denture) as per the Schedule of Fees
    - Issue of the appropriate voucher type for the service type required
    - The voucher was submitted for payment by an approved business or practitioner, and
    - The business or practitioner has complied with the policy's roles and responsibilities (refer to Point 5).
- The following may result in non-payment of the voucher:
    - The business and practitioner has not complied with the policy's roles and responsibilities (refer to Point 5)
    - Vouchers received more than 30 days after the treatment has been completed
    - Vouchers with treatment items that were provided after the voucher expiry date (unless prior authorisation has been obtained from the LHD)
    - Services provided by a business or practitioner that is not currently approved to participate in the OHFFSS
    - Treatment over and above recommendation
    - Treatment not to a required standard, or
    - Treatment items not included in Schedule of Fees.
- Once the above procedures have been followed, the LHD are required to:
    - Return any radiograph(s) supplied by the business or practitioner unless double radiographic films have been used, and
    - Forward the claim to the relevant LHD Manager, or nominee, for authorisation and HealthShare payment processing.

6.3 Quality Assurance

LHDs are accredited institutions and therefore undertake quality assurance activities on a regular basis. The operation of the OHFFSS and the care provided under the Scheme is included in these accreditation processes.

The NSW Ministry of Health, the Australian Dental Association NSW Branch and the Australian Dental Prosthetist Association NSW support the use of quality assurance measures.

The evaluation of the Scheme may include relevant Australian Council of Healthcare Standards clinical indicators and other quality activities.

Attachment A: Conditions of Access to Web-based Oral Health Fee for Service Scheme

The conditions of access set out below need to be read in conjunction with the Oral Health Fee for Service Scheme Implementation Procedures. Non-compliance with the conditions of access set out here and in that Policy Directive could lead to suspension or removal from the OHFFSS.

1. Access to the facility is via a user name and password. The user is responsible at all times for the proper use of an allocated password and for all access under the password, which should be changed regularly to prevent misuse.
2. To protect both business and practitioner personal information that is uploaded onto the OHFFSS web based system, users will only be able to view and edit their own profile.
3. It is the policy of NSW Health (the administrator of the Oral Health Fee for Service Scheme) that:
    - Access to the web-based scheme be monitored on an ongoing, continuous basis to guard against intentional inappropriate use and
    - Records of access are maintained and routinely audited to ensure appropriate use of the web based system.

Personal information – In agreeing to be registered with the OHFFSS, you acknowledge that your personal information will be stored and backed up securely and that only authorised Local Health District or OHFFSS administrators will have access to the information. Your personal information will only be used and disclosed for the purposes of the Oral Health Fee for Service Scheme or as lawfully required.

If at any time you have concerns about how your personal information is being used, accessed or disclosed, please contact the Local Health District's Privacy Liaison Officer or State-Wide OHFFSS Coordinator on 1800 938 133 or WSLHD-ohffss@health.nsw.gov.au .

Acceptance

In accepting entry I confirm that I have read, understood and will comply with the NSW Health Policy Directive on the Oral Health Fee for Service Scheme and Schedule of Fees, and agree to the conditions and requirements set out in that Policy Directive and Schedule of Fees. I agree that my use of the web-based administration tools will be in accordance with the conditions and requirements set out in the conditions of use and the Policy Directive. I understand and accept that my access and usage is liable to be monitored on an ongoing and continuous basis. I understand and accept that my registration on the OHFFSS may be suspended or removed if I breach the Policy Directive or the conditions of access.

If I provide dentures I will comply with the Therapeutic Goods Administration Standards (http://www.tga.gov.au/). I understand and accept that my participation in the Oral Health Fee for Service Scheme will be monitored on an ongoing and continuous basis.

To read the Oral Health Fee for Service Scheme Policy and Schedule of Fees, click on **Read** for the Policy and click on **Read** for the Schedule of Fees.

Click **Accept** to comply and to access the Oral Health Fee for Service Scheme and Schedule of Fees.

If you click on **Reject** it means that you do not wish to comply and you will not be able to proceed any further.

Attachment B: Conditions of Use to Web-based Oral Health Fee for Service Scheme

These conditions of use apply to staff of the relevant Local Health District and the NSW Ministry of Health who as part of their role, have access to the Web-based Oral Health Fee for Service Scheme system.

All staff are required to comply with the *Health Records and Information Privacy Act (HRIP) 2002* to protect the privacy of health information in NSW. All staff are also required to comply with the *Privacy and Personal Information Protection (PPIP) Act 1998* which covers other personal information such as employee records.

NSW Health is committed to safeguarding the privacy of patient, employee and personal information and has implemented measure, to comply with these legal obligations.

Guidance for staff in relation to their legal obligations is provided in the *NSW Health Privacy Manual for Health Information*. All staff are also bound by a strict code of conduct to maintain confidentiality of all personal and health information which they access in the course of their duties.

In addition to the legislative and policy related obligations, staff must comply with the following conditions of access:

1. Staff may only access patient/employee, personal or health information where this is required in the course of their employment.
2. Access to the OHFFSS web-based system is by staff employee number and password. The user is responsible at all times for the proper use of an allocated password and for all access under the password, which should be changed regularly to prevent misuse.
3. Personal and health information contained in the OHFFSS web based system must not be used or disclosed for improper purposes.
4. To protect both business and practitioner personal information that is uploaded onto the OHFFSS web based system LHD staff, unless approved to have super users rights, will only view and edit records of businesses and practitioners who are participating in the OHFFSS within their LHD.
5. It is the policy of NSW Health, the administrator of the Oral Health Fee for Service Scheme, that:
    - Access to the web-based scheme be monitored on an ongoing, continuous basis to guard against intentional inappropriate use and
    - Records of access are maintained and routinely audited to ensure appropriate use of the web based system.

If at any time you have concerns about how system information is being used, accessed or disclosed, please contact the State-Wide OHFFSS Coordinator on 1800 938 133 or WSLHD-ohffss@health.nsw.gov.au .

Acceptance

In accepting entry I confirm that I have read, understood and will comply with the NSW Health Privacy Manual for Health Information, the Code of Conduct (PD2015_049), the OHFFSS Policy Directive and these Conditions of Use. I understand and accept that my access and usage will be monitored on an ongoing and continuous basis.

To read the NSW Health Privacy Manual for Health Information (http://www.health.nsw.gov.au/policies/manuals/Documents/privacy-manual-for-health-information.pdf), click on **Read** and click on **Read** for the Code of Conduct PD2015_049. (http://www0.health.nsw.gov.au/policies/pd/2015/pdf/PD2015_049.pdf)

Click **Accept** to comply with NSW Health Privacy Manual for Health Information and Code of Conduct PD2015_049. If you click on **Reject** it means that you do not wish to comply and you will not be able to proceed any further.

SCHEDULE OF FEES FOR ORAL HEALTH FEE FOR SERVICE SCHEME
(IB2023_015)

IB2023_015 replaced IB2022_017

PURPOSE

This Information Bulletin provides information on the current Oral Health Fee for Service Scheme (OHFFSS) Schedule of Fees. Fees have been indexed in alignment with movement in the Department of Veteran's Affairs Fee Schedules of Dental Services.

The Schedule of Fees can be found on the NSW Health Oral Health webpage Oral Health Fee for Service Scheme.

KEY INFORMATION

This Information Bulletin is to be read in conjunction with NSW Health Policy Directive Oral Health Fee for Service Scheme (PD2016_018), and Australian Dental Association *The Australian Schedule of Dental Services and Glossary, (Twelfth Edition*).

Voucher limits

The maximum amounts payable for authorised vouchers are:

- Episodic Voucher: **$450.00 or as printed on voucher**
- General Voucher: **$1000.00 or as printed on voucher**
- Denture Voucher: **$1750.00 or as printed on voucher**

NSW Public Health Organisations may:

- raise or lower voucher limits in line with local policy
- pre-authorise and fund other Australian Dental Association items not listed in this schedule where it is applicable to an individual patient or model of care.

Note that actual limits are printed on each voucher.

ORAL HEALTH PATIENT RECORD PROTOCOL (GL2015_017)

GL2015_017 rescinds PD2008_024

PURPOSE

The Oral Health Patient Record has been updated to assist oral health care providers within NSW Health maintain records that meet the Dental Board of Australia Guidelines on Dental Records (July 2010).
(http://www.dentalboard.gov.au/Codes-Guidelines/Policies-Codes-Guidelines.aspx)

KEY PRINCIPLES

The Oral Health Patient Record has been reviewed and updated to reflect a contemporary view of patient centred care. The guideline applies to dentists, dental therapists, dental hygienists, oral health therapists, dental prosthetists and dental specialists.

USE OF THE GUIDELINE

The Oral Health Patient Record will result in a review of current work practices in such areas of odontogram, charting techniques and abbreviations. This will ensure that all Oral Health practitioners create and maintain a high level of quality in record keeping including detailed documentation of relevant patient information, both current and historical.

These practices are to serve the best interests of NSW residents who access public oral health services and that contribute to their safety, confidentiality and continuity of dental care. This guideline describes the base line requirements for oral health patient records whether they are in paper-based or electronic form.

1 BACKGROUND

1.1 About this document

The Oral Health Record Procedures provides a standard of documentation in clinical dentistry with a list of commonly accepted abbreviations and charting symbols for both paper based and electronic software programs across NSW. Electronic software programs will differ in charting methods and symbols. It is however prudent that these charting methods and symbols provide a clear definition of presenting condition(s), treatment required and treatment provided.

This document provides an overview of the key elements of an oral health clinical record:

- Medical history
- Examination and treatment planning
- Primary and permanent odontograms and
- Charting symbols and definitions.

1.2 Key definitions

Examination	Includes the examination of both soft and hard tissues, and findings are recorded using an odontogram and/or text. The charting needs to comply with the World Dental Federation (FDI) system and should include: (i) restored teeth (tooth code, surface/s involved and materials used) (ii) sound and unrestored teeth (iii) missing teeth (iv) hard tissue and soft tissue abnormalities (v) occlusion, including tooth mobility (vi) periodontal status including periodontal pocket depth, supra-gingival calculus, sub-gingival calculus and oral hygiene status and type of prosthetic appliances present.

1.3 Evaluation framework

LHDs to put in place an audit process to ensure compliance with the minimum requirements of this guideline.

1.4 Associated NSW Health policies and guidelines

It is the role and responsibility of treating dental practitioner and supporting dental staff to read the Oral Health Patient Protocol guideline in full and implement them accordingly. This guideline is to be read in conjunction with:

- Clinical Procedure Safety
- Consent to Medical Treatment – Patient information
- Health Care Records – Documentation and Management
- Privacy Manual
- Record Management – Department of Health
- Records_ Disposal Authority (DA 25) (Use of functional) by NSW Department of Health
- State Health Forms
- Student Training and Rights of Patients

Ministry of Health policies and guidelines are public documents and are located on NSW Health website. www.health.nsw.gov.au/

2 KEY ELEMENTS

2.1 Patient identification

Patient identification by the dental practitioner needs to be in compliance with NSW Health Clinical Procedure Safety policy.

To ensure compliance the dental practitioner and clinical team must undertake the time out procedure and note accordingly in patient's progress notes with relevant signatures.

2.2 Medical History

The patient dental record should document a medical history as taken by the dental practitioner.
A medical history should include the following elements:

- Positive and negative responses
- Any adverse reactions, allergies, or events

- Medical history updates are to be completed at the beginning of each course of care. Check verbally, and if there are:
  - No changes, document 'medical history checked, no update' (MH – nil update)
  - Amend changes to the existing history or if necessary document a new medical history.
- Each dental practitioner has to ensure and sign off that the medical history is completed to their satisfaction.

2.3 Consent for treatment

Obtaining consent for treatment needs to be in compliance with the NSW Health 'Consent to Medical Treatment – Patient Information' and Multilingual Health Resources by AHS, DoH and NGOs Funded by NSW Health (Guidelines for Production).

2.4 Emergency Care

Clinical notes should indicate the following elements:

- Chief complaint/reason for attendance
- Diagnostic data
- Clinical findings
- Radiograph(s) taken
- Results of investigations – imaging, vitality tests etc
- Management plan or treatment given.

2.5 Examination and Treatment Plan for a Course of Care

Clinical notes should indicate the following elements:

- Presenting complaint
- Past dental history
- Full dental charting of dentition on examination when providing a full course of care
- A separate charting of treatment required (which may be amended to note the progress of treatment)
- Notes regarding:
  - Soft tissues,
  - Extra-oral findings,
  - Intra-oral findings,
  - Periodontal health,
  - Preoperative and postoperative risks and treatment options,
  - Sterilization tracking labels, and
  - Brochures, fact sheets and Oral Health Fee for Service vouchers provided, if required.
- A treatment plan of appropriate detail.

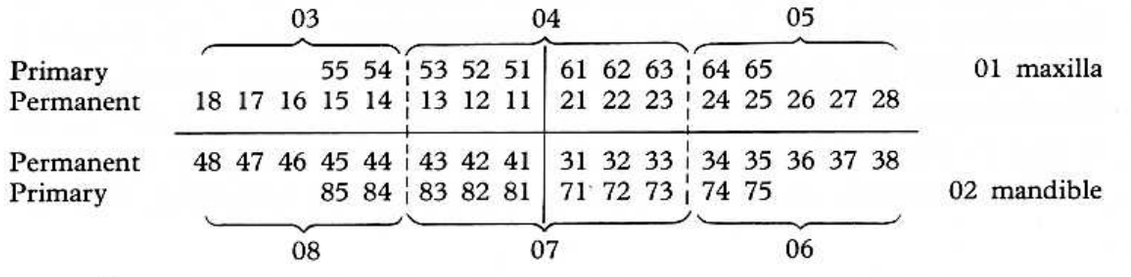
2.6 Charting and Tooth Identification

The Federation Dentaire Internationale (FDI) notation for recording tooth number is to be used (Refer to Diagram A), as follows:

Two digit codes for the jaws and sextants of the mouth are:

- 00 indicates the mouth
- 01 indicates the maxilla
- 02 indicates the mandible
- 10 to 40 indicate the quadrants in clockwise order starting on the top right.

Diagram A

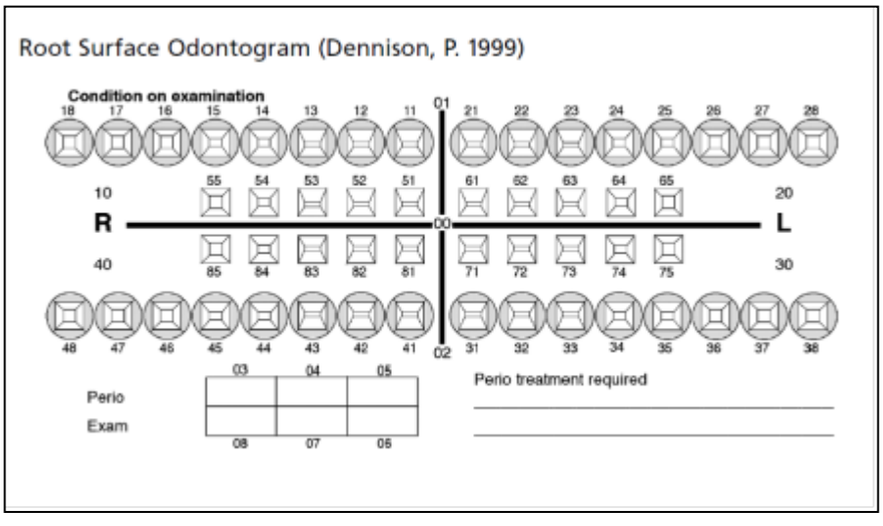


2.6.1 General Odontogram

The odontogram for permanent teeth may have root surfaces and a primary odontogram should be available where applicable (refer to Diagram B).

Diagram B

Dennison, P (1999) 'A Modified Odontogram to enable Root Surface Charting' Community Oral Health and Epidemiology, Westmead Centre for Oral Health, Faculty of Dentistry University of Sydney Australia.



2.6.2 Periodontal Charting

When a periodontal charting is required it should include the recording of:

- Recession
- Pocket depth
- Suppuration
- Bleeding on probing
- Furcation involvement
- Mobility.

2.7 Anaesthetics

Clinical notes should indicate the following elements:

- Type of anaesthetic used
- Amount of anaesthetic used
- Type of injection given
- Any adverse reactions, allergies, or events.

2.8 Restorations

Clinical notes should indicate the following elements:

- Tooth involved
- Surface/s involved
- Base/linings used
- Restoration material and shades used
- Unusual depth or other features
- Pin placement, if used
- Pulp exposure (size, location, mechanical/carious), if this has occurred.

2.9 Exodontia

Clinical notes should indicate the following elements:

- Tooth to be extracted
- Reasons for extraction
- Tooth extracted
- Radiographic evidence to support decision for extraction
- Any complications
- An indication if post-operative instructions were given
- An indication if haemostasis has been achieved
- Need for review, as required.

2.10 Minor Oral Surgery

Clinical notes should indicate the following elements:

- Reason for procedure
- Procedure undertaken including technique used
- Supporting test/data/symptoms
- Any complications
- An indication if haemostasis has been achieved
- An indication if post-operative instructions were given
- Need for review, as required.

2.11 Medication

Clinical notes should indicate the following elements:

- The type of medication prescribed
- Reason for administration of prescription
- The dose of medication and indication of the method of delivery
- If antibiotic prophylaxis is used, the time of administration and the time of commencement of treatment
- Any adverse reactions, allergies, or events
- Results of antibiotic sensitivity testing, as required
- Discussions with the patient's medical practitioner.

3 TERMS, ABBREVIATIONS AND SYMBOLS

Abbreviations and symbols may vary depending on the patient record type (paper or electronic).

ORAL HEALTH SPECIALIST REFERRAL PROTOCOLS (PD2011_071)

PD2011_071 rescinds PD2010_027.

PURPOSE

This policy statement and attached protocol aim to improve referral pathways from public and private medical and dental practitioners to public specialist oral health services by establishing clear and consistent patient flow pathways for eligible NSW residents who require specialist oral health services.

MANDATORY REQUIREMENTS

Referral centres and referring practitioners are to ensure compliance with specific oral health speciality referral criteria, as approved by Public Dental Services and the processes as detailed in the Oral Health Specialist Referral Protocol.

The oral health specialist referral form is to be completed by a referring practitioner when referring a patient to a specialist service.

IMPLEMENTATION

Chief Executives must:
- assign responsibility and personnel to implement the guidelines;
- approve specific public dental services specialist referral criteria.

Medical and Dental Practitioners, Oral Health Clinical Directors and Oral Health Managers must:
- promote efficient patient flow pathways;
- monitor the implementation of the policy and specific public dental services criteria.

Referral Centres must:
- comply with the responsibilities detailed at section 3.3

Local Oral Health Staff must:
- comply with public dental services approved specialist referral processes and specific public dental services criteria.

1. BACKGROUND

1.1 About This Document

This policy directive is aligned to the NSW Oral Health Strategic Directions 2005-2010, which sets the platform for oral health action in NSW into the next decade. The Oral Health Specialist Referral Protocols reflects the operating principles:

- Create better experiences for people using health services.
- Make smart choices about the costs and benefits of health services.

The Oral Health Specialist Referral Protocols aims to improve referral pathways from public and private medical and dental practitioners to public specialist oral health services. By standardising procedures and protocols between referring practitioners and specialist oral health services the policy will:

- increase the efficiency of specialist oral health services;
- improve the continuum of patient care;
- improve the level of feedback to referring practitioners.

The Oral Health Specialist Referral Policy and Protocols have been prepared by the Centre for Oral Health Strategy NSW and the State Oral Health Executive through a specialist referral review working group.

1.2 Key Definition

In this document the term:

- **Must** – indicates a mandatory action required that must be complied with.
- **Should** – indicates a recommended action that should be followed unless there are sound reasons for taking a different course of action.

NSW Public Dental Service

Throughout this document the term public dental service is used to describe the team of administration and clinical staff who provide public oral health services to eligible NSW residents.

1.3 Patient Management

As stated in NSW Health Policy Directive PD2008_056 'Priority Oral Health Program and List Management Protocols', dental treatment provided during a general course of care will depend on the patient's oral health needs, as determined by the treating clinician and as per public dental service's policies. In a general course of care the treatment that is provided should result in the patient being dentally fit.

Treatment flows depend on the severity and urgency of the condition; patients may be offered an appointment or placed on a list. List options are: assessment, treatment, referral and managed care. Should a patient require a specialist service following an assessment appointment, and they meet the clinical criteria for that service, a referral to a specialist Dental Officer can be made.

It is important that each dental patient referred for specialist consideration has a general dental clinician to act as his/her case manager. This clinician acts as the patient's advocate, first point of contact for specialist advice and follow-up and co-ordinator for referrals to other dental or medical specialists. Without a general dental practitioner as case manager, patients have the potential to undergo multiple cycles of specialist assessment and treatment, preventing other patients from accessing specialist assessments and treatments.

A guiding principle of the referral process, in both medical and dental practice, is that the patient remains under the clinical case management of the referring general practitioner. As such, the patient is to be managed at the referring oral health clinic for all emergency dental procedures, and for all presentations which are not covered by the referral and for ongoing management and follow-ups after the specialist course of care is completed.

1.4 Eligibility for Public Oral Health Services

The NSW Health 'Eligibility of Persons for Public Dental Care' policy directive defines eligibility for public dental care for NSW residents. Adult patients will require a valid health care card or pension card to qualify for specialist oral health care.

Only adults (18yrs and over) who are self holders of a valid Centrelink concession card are eligible for inpatient specialist dental services including orthodontic surgery and for non-admitted procedural dental specialist services such as endodontics, orthodontics, oral surgery, prosthodontics and periodontics.

All children and young persons (0-<18yrs) are eligible:

- to be referred for consultation;
- for the provision of non-admitted treatment in all specialties, except orthodontics;
- for admitted paediatric dental specialty services for conditions outlined in 11.2.1 – 11.2.4.

However, only children and young persons (0-<18yrs) who are self holders or whose parents/ guardians are holders of a valid Centrelink concession card, are eligible for admitted paediatric dental specialty services for conditions outlined in 11.2.5 and 11.2.6 and for any orthodontic specialty service.

Exemption to these eligibility criteria can only be made for patients for teaching purposes and those patients with special clinical needs as authorised by Clinical Directors of Local Health District Oral Health Services or their formally authorised delegate/s. For these cases a service charge may be applicable.

1.5 Related Policy Directives and Guidelines

This Policy Directive should be read in conjunction with:

- Prevention of Osteonecrosis of the Jaw (ONJ) in Patients on Bisphosphonate Therapies[1]
- Consent to Medical Treatment - Patient information[2]
- Correct Patient, Correct Procedure and Correct Site[3]
- Data collections - Disclosure of unit record data held for research or management of health services[4]
- Eligibility of Persons for Public Dental Care'[5]
- Medical Records in Hospitals and Community Care Centres[6]
- Oral Health Record Protocols[7]
- Priority Oral Health Program and Wait List Management[8]
- Student Training and Rights of Patients[9]
- Waiting Times and Elective Patient Management Policy[10]

2. ORAL HEALTH SPECIALIST SERVICES

2.1 Referral Centres

Public oral health services in NSW provide specialist dental care at the three major oral health teaching facilities (Referral Centres) which are mainly associated with the University of Sydney, Faculty of Dentistry.

[9] http://www.health.nsw.gov.au/policies/pd/2005/PD2005_548.html
[10] http://www.health.nsw.gov.au/policies/pd/2012/PD2012_011.html

These Referral Centres are:

- Sydney Dental Hospital (SDH), 2 Chalmers Street, Surry Hills 2010, telephone: 02 9293 3200.
- Westmead Centre for Oral Health (WCOH), Darcy Road, Westmead 2145 or PO BOX 533, Wentworthville 2145, telephone: 02 9845 7178.
- The Children's Hospital Westmead, Dental Department, Westmead, corner of Hawkesbury Road and Hainsworth Street, NSW 2145, 02 9845 2582.

Other NSW Local Health District Oral Health Services may also provide a limited range of specialist services. For further information contact the local Oral Health Service Call Centre (refer to http://www.health.nsw.gov.au/cohs/contacts.asp) closest to the patient's place of residence.

2.2 Specialist Service Type

The following specialist services are offered:

- General Anaesthesia
- Conscious sedation for dental procedures
- Endodontics
- Oral and maxillofacial surgery
- Oral radiology
- Oral medicine, oral pathology
- Orthodontics
- Paediatric Dentistry
- Periodontics
- Prosthodontics
- Special Care Dentistry

2.3 List Management

Referral Centres who place referred patients on a wait list for either assessment or treatment are required to inform both the patient and the referring practitioner. NSW Health has developed a policy directive for Waiting Times and Elective Patient Management, which identifies benchmark waiting times.

Note: that specialist waiting lists are not to be included in LHD general wait lists (refer to POHP and List Management Protocol Policy Directive).

3. REFERRAL PROCESSES

3.1 Reason for Referral

Referrals may be made for the following reasons:

- an opinion only, regarding a specific condition or particular aspect of the patient's care;
- management of a specific complaint or condition, subject to acceptance of the referral; or
- ongoing management of a patient whose oral health condition/overall medical status dictates that his/her oral health treatment needs be undertaken by a specialist clinician/institution, subject to acceptance of the referral.

3.2 Referring Practitioner Responsibilities

- Complete the oral health specialist referral form and write the date of the referral on the form.

- Ensure that all fields are completed for every patient. This includes:
  - patient's full name, address details and phone number;
  - Medicare card number, including the eleventh digit and expiry date;
  - any entitlement card numbers, stipulating type and expiry dates;
  - copies of relevant radiographs including OPGs (to avoid unnecessary repeat radiation exposure);
  - access issues and special requirements where relevant;
  - any medical test results; and
  - a brief medical history and indication of disability
- Ensure that the contact details of the referring practitioner are clearly recorded on the form.
- Ensure that the contact details (including telephone numbers) of the patient's general and specialist medical practitioner/s are clearly recorded on the form.
- When complete, post or transmit the referral form to the appropriate specialist service/referral centre.
- Send only one referral per clinical issue. That is, do not send a referral to multiple referral centres to increase the probability of an early outcome. Similarly, do not refer for multiple clinical issues on the same referral form, e.g TMJ, exodontia and endodontics, as this risks the referral being held up in one specialist department, while the second or third issue do not get prioritised.
- Inform the patient that waiting times for assessment and treatment usually apply, and that, until a specialist course of care commences, all dental treatment is to be managed at the local general dental practice level.

3.3 Referral Centre Responsibilities

- Acknowledge receipt of the referral in a timely manner.
- Log patient details into the NSW Health Information System for Oral Health (ISOH), attach the referral form to the patient's paper record and place a scanned copy into the patient's electronic record in ISOH.
- Review the referral (to a Specialist or Department Head) in accordance with the Specialist Referral Policy and Protocols and specific LHD referral criteria.
- Prioritise the patient according to identified need.
- Contact the patient to offer a consultation appointment. Inform the patient and the referring practitioner if wait lists are applicable for either consultation or treatment appointments.
- When an offer of assessment has been returned unacknowledged, the Referral Centre is to discontinue the referral and return the referral to the referring clinician for local management.
- Advise the referring practitioner of the outcome of the consultation/s and the proposed course of care, or the reasons for not proceeding with specialist service.
- Advise the referring practitioner on how to best manage the patient whilst waiting for a general anaesthesia if deemed required.
- Consult with the referring practitioner when proposed specialist care will impact on ongoing general oral health care and when necessary return the patient for general treatment to be completed before specialist services can commence. Maintain patient records by:
  - retaining a copy of the Specialist Referral Form and the original or duplicated radiographs as appropriate; and
  - attaching relevant documentation on the feedback process
- Comply with NSW Health Consent to Medical Treatment - Patient Information policy directive by informing the patient and/or carer/guardian about the risks and benefits of procedures such as intravenous sedation or general anaesthesia.

3.4 Referral Centre Caveats

- All referrals will be logged for consultation if they meet Specialist Referral criteria.
- Depending on the outcome of the specialist consultation, including further tests or analyses, a referral may not necessarily lead to treatment.
- Patients who do not meet the criteria for specialist referral will not automatically qualify for general treatment at the Referral Centre and will be returned to the referring clinic.
- Post-graduate trainees, students, registrars, or general dentists/therapists/hygienists may provide some or all of the treatment as appropriate under supervision of a specialist.

3.5 General Advice for Referred Patients

The Referral Centre should advise the referred patient and/or their carer/guardian that:

- they need to bring their valid Medicare card and any other entitlement cards (e.g. health care card or pension card) to their consultation appointment and their first treatment appointment;
- should a patient's eligibility status change during the course of treatment, they may be required to meet the costs of completing the treatment;
- if they are unable to consent to treatment a legal guardian must accompany them to the assessment appointment;
- treatment will continue only if patients actively maintain good oral health status, including compliance with recommended changes of behaviour (e.g. effective oral hygiene, cessation of nail-biting, wearing of functional appliances) and attendance for diagnostic tests;
- patients have a right to an interpreter or Aboriginal Liaison officer/health worker if they require assistance (Consent to Medical Treatment - Patient information PD). The interpreter or Aboriginal Liaison officer/health worker may attend the patient's appointments and the Referral Centre can organise this. (*Note: that this information is to be logged into ISOH.*);
- the initial specialist appointment is a consultation only to assess dental needs;
- if accepted for a specialist course of care, patients will invariably be placed on a treatment wait list, in accordance with the urgency of their assessed dental needs;
- treatment under oral sedation, intravenous sedation or general anaesthesia will be determined by the appropriate specialist service and not by the referring clinician.

4. GENERAL ANAESTHESIA FOR DENTAL PROCEDURES

The need for general anaesthesia (GA) represents the clinician's ultimate solution to treating a patient's dental problem. The decision to recommend general anaesthesia is not to be taken lightly as a risk of serious complications always exists. When deciding to place a patient under general anaesthesia, the treating dental clinician must consider the whole care of the patient.

To be exempt from a service charge, referred patients must hold a valid Centrelink entitlement card (e.g. valid health care card or pension card) (Point 1.4).

4.1 Key Referral Information

Prior to GA assessment appointments must be made to ensure a suitable treatment plan has been proposed and consented to, the patient's behaviour is such that a satisfactory outcome can be achieved and a home-care program is established which includes such aspects as tooth brushing instruction, referral to a dietician, instruction on the use of home fluorides and follow-up visits, as appropriate.

4.2 Index of Treatment Needs

Certain clinical situations strongly indicate the need for general anaesthesia, these are:
- severe odontogenic cellulitis or abscess/s;
- facial trauma;
- surgical management of pathology;
- multiple carious teeth requiring extraction and/or restoration.

Patients indicated for GA are to be assessed in accordance with the American Society of Anaesthesiologists (ASA 2008) categories of anaesthetic risk. These are:
- ASA Class 1 Health patient
- ASA Class 2 Mild to moderate systemic disease without significant limitations
- ASA Class 3 Severe systemic disturbance without limitations
- ASA Class 4 Life-threatening systemic disorder
- ASA Class 5 Moribund patient not expected to survive >24hrs
- ASA Class E Emergency patient

Most patients who are ASA 1 or 2 will be suitable for day-stay anaesthesia.

However, patients with more severe systemic disease (ASA 3 or 4) may need overnight hospital care to ensure that they are maintaining their airway, tolerating oral food and fluids, that any pain is satisfactorily managed and that there is no ongoing bleeding. This overnight hospitalisation would be in an acute or general hospital.

4.3 General Anaesthetic Services

General anaesthetic services for dental procedures are provided by a multidisciplinary anaesthetic and anaesthetic assistant workforce with specialist dental expertise in the management of the patient's presenting oral health condition (QG 2009).

Dental treatment made available under GA can be provided by a dental specialist, a general dentist who has been appropriately credentialed by local public dental services and/or a post-graduate specialist registrar under appropriate supervision.

The patient will have a pre-anaesthetic assessment with an anaesthetist prior to the GA to ensure that the patient is in an optimal state of health for the planned procedure (QG 2009).

The GA may be postponed if the anaesthetist determines risk factors such as:
- medications have not been attested by the patient, such as warfarin and/or bisphosphonate;
- respiratory tract infection; or
- patient has not fasted according to hospital instructions.

5. CONSCIOUS SEDATION FOR DENTAL PROCEDURES

Sedation for dental procedures (with or without local anaesthesia) includes the administration by any route or technique, of all drugs that result in depression of the central nervous system. Conscious sedation offers an efficient and effective way of providing the patient with profound anxiety relief and pain management during dental procedures.

For further information, refer to the Australian & New Zealand College of Anaesthetists, Faculty of Pain Medicine Australian and New Zealand College Of Anaesthetists, Gastroenterological Society of

Australia, Royal Australasian College of Surgeons, Australasian College for Emergency Medicine, College of Intensive Care Medicine of Australia and New Zealand, Royal Australasian College of Dental Surgeons, Royal Australian and New Zealand College of Radiologists Professional Document PS9 (2010): "*Guidelines on Sedation and/or Analgesia for Diagnostic and Interventional Medical, Dental or Surgical Procedures*".

To be exempt from a service charge, referred patients must hold a valid Centrelink entitlement card (e.g. valid health care card or pension card) (Point 1.4).

5.1 Key Information

The choice of general anaesthesia or conscious sedation will be decided at the specialist assessment/ consultation using specific criteria based on health assessment, treatment complexity, behavioural problems and an anxiety assessment.

Detailed instructions will be given to the patient before any appointment for sedation or general anaesthesia. The patient must have a responsible adult to drive them home after the procedure.

5.2 Index of Treatment Needs

Referral for Conscious Sedation procedures includes patients in the following categories:
- Paediatric.
- Dento-alveolar surgery.
- Special Care Dentistry.
- Dental and/or needle phobias.

Patients who are unsuitable for Conscious Sedation include:
- IV drug users.
- Methadone patients.
- Patients with psychiatric disorders.
- Patients with significant health problems, e.g. ASA III or higher.

6. ENDODONTICS

All referred patients must hold a valid Centrelink entitlement card (e.g. valid health care card or pension card). (Point 1.4)

Prior to referral for endodontics it is essential that:
- the tooth is functional, free of active dental caries and well temporised by the referring practitioner. This may require placement of an orthodontic band;
- the referring clinician understands and accepts responsibility for all emergency and other dental care of the patient whilst waiting for specialist treatment;
- all other restorative treatment is completed prior to referral.

Where the patient is advised that a tooth is assessed as endodontically untreatable, they will be returned to the referred clinician for management.

6.1 Key Referral Information

Teeth that can be added to an existing functional partial denture without detriment to a patient's oral condition will not be considered for endodontic treatment.

Additional factors that must be considered are the:

- status of the root canal *per se* and the reason for treatment (calcified, blocked, perforated, incompletely filled);
- condition of apical third of the root canal (i.e. open, closed, resorbed or eroded);
- strategic value of the tooth to the patient's future restorative needs, for example, as an abutment tooth for a denture;
- patient's medical and psychological conditions, age or infirmity which may impact on treatment provision or outcome;
- number of teeth already lost in the arch and presence of a partial denture;
- overall extent of treatment required in the mouth.

6.2 Index of Treatment Needs

Patients will be placed on a waiting list for definitive endodontic treatment according to the following Priority Codes:

6.2.1 Priority 1 (High Priority)

- traumatized and avulsed teeth. These include luxated, avulsed and fractured teeth;
- teeth with resorptive lesions or abnormalities. These include dens invaginatus & dens evaginatus, external or internal root resorption.

6.2.2 Priority 2 (Medium Priority)

- multi-rooted, restorable teeth important for function with difficult access to pulp chamber, or complications following attempted endodontic treatment, in a well maintained mouth;
- re-treatment cases, with history of pain, involving removal of root filling materials, procedural errors and cases involving surgery.

6.2.3 Priority 3 (Low Priority - Unlikely to be offered specialist care)

- single rooted teeth in a well maintained mouth that require straightforward endodontic treatment not necessarily requiring specialist attention;
- unopposed multi-rooted restorable functional teeth:
  - in a poorly maintained mouth with no prospects of sustainable improvement in periodontal condition, or
  - in a heavily restored mouth requiring multiple endodontic therapies.

7. ORAL AND MAXILLOFACIAL SURGERY

Oral and maxillofacial surgery offers treatment to patients requiring surgical management of trauma, developmental disorders or diseases involving the dento-facial, dento-alveolar or dento-maxillary complexes and associated structures.

To be exempt from a service charge, including anaesthetic, theatre and ancillary fees, referred patients must hold a valid Centrelink entitlement card (e.g. valid health care card or pension card). (Point 1.4)

7.1 Index of Treatment Needs

The scope of Oral and Maxillofacial Surgery Services is broad and includes:

7.1.1 Emergency treatment

- trauma - management of fractures of the facial skeleton including the primary and secondary management of hard and soft tissues and other injuries involving the mouth, jaws and associated structures;
- other - management of acute infections of the jaws and associated areas including complications following dental treatment, eg bleeding, infection.

7.1.2 Dento-alveolar surgery

- management of complex oral surgical procedures such as, endodontic surgery, removal of impacted teeth, management of benign tumours and cysts of the oral cavity, and oral surgical management of patients with significant medical problems

7.1.3 Orthodontic/Orthognathic Surgery

- the investigation, diagnosis and surgical correction of deformities of the face, jaws and related structures, including cleft lip and palate, utilising the principles of, and in association with, orthodontic management

7.1.4 Prosthetic and pre-prosthetic surgery

- surgical preparation of hard and soft tissues for prosthodontic treatments;
- the placement of implants into the jaws to provide retention for prostheses which replace missing teeth and/or missing tissues;

the placement of extra-oral implants can provide retention for a range of prostheses, such as maxillo-facial prostheses. These procedures are usually managed in conjunction with a maxillo-facial prosthodontist.

8. ORAL RADIOLOGY

This service provides intra-oral imaging for specific diagnostic needs, extra-oral planar and panoramic imaging, including cone beam volumetric imaging for:

- pathology screening and case work-up;
- oral surgery case work-up;
- prosthodontic case work-up including implant case work-up;
- orthodontic/Orthognathic case work-up;
- endodontics screening;
- paediatric dental screening; and
- periodontal screening.

With the advent of digital radiography, it is possible to take radiographs at referral centres or remotely, e.g. at acute care hospitals or private radiology practices, and have an oral radiologist or other dental specialist interpret the images. This electronic transmission or teleradiography may assist in rapid diagnosis, or even avoid patient travel.

9. ORAL MEDICINE/ORAL PATHOLOGY

Oral Medicine/Oral Pathology provide tertiary diagnostic and clinical services to the state of NSW by referral only. Services include:

- oral medicine/oral pathology;
- management of the severely medically-compromised patient requiring oral/dental care and treatment;
- management of conditions including the diagnosis of malignancy and treatment in conjunction with the Head and Neck clinical team;
- the investigation and management of diseases of the salivary glands;
- the diagnosis and management of patients with oral manifestations of auto-immune diseases;
- facial pain.

9.1 Key Referral Information

To be exempt from a service charge, referred patients must hold a valid Centrelink entitlement card, for example valid health care card or pension card (refer to point 1.4).

9.2 Index of Treatment Needs

Indications for referral are patients with:
- any form of suspicious oral lesion or disease;
- suspected cases of mouth/oral cancer and pre-cancerous conditions;
- complex oro-facial pain whose cause has defied explanation and treatment; and
- extensive or complex medical conditions that are best treated in a hospital environment, for example:
  - haemophiliacs,
  - post organ- and bone marrow-transplant recipients; and
  - patients who have had radiotherapy treatment to the head and neck region.

There are 3 priority categories as identified below:

9.2.1 Priority 1 (to be seen within two (2) working days/48 hours)
- suspected oral malignancy;
- severe, incapacitating (unable to eat or drink) oro-pharyngeal ulceration;
- severe, intractable, incapacitating oro-dental pain unrelieved by narcotic opiate agents;
- active dental/periodontal infection in a seriously immuno-compromised patient (chemotherapy or head and neck radiotherapy recipient, patients on significant immuno-suppressant therapy, especially anti-T-cell agents or cytotoxic drugs).

9.2.2 Priority 2 (to be seen at the next available appointment, or within four (4) weeks)
- significant intractable oro-pharyngeal ulceration or oro-dental pain unrelieved by narcotic analgesics;
- patients with suspected oral malignancy awaiting definitive radical surgery, radiotherapy or chemotherapy;
- prior to head and neck radiotherapy treatment;
- pre-transplant (organ or haematopoietic stem cell) or pre-heart valve replacement dental assessment.

9.2.3 Priority 3
- all other cases.

10. ORTHODONTICS

The criteria for referral of patients for public orthodontic services are as follows:
- orthodontic treatment will not be offered to patients who are not dentally fit, that is, who have active caries, chronic marginal gingivitis or whose oral hygiene is not sound;
- referrals must include details of the malocclusion, as listed in the table of treatment need (Table A), and a recent panoramic radiograph (OPG);
- if the patient is assessed as eligible for, and in need of, public orthodontic care the supervising Dental Officer should refer the patient to a designated Dental Officer for prioritisation of care. Note: A designated Dental Officer is a public dental officer who has sufficient orthodontic knowledge and expertise which includes:
  - the ability to recognise the need for interceptive care;
  - the ability to undertake minor orthodontics; and
  - the ability to prioritise severe cases for referral to specialists.

1.1 Key Referral Information:

To be exempt from a service charge, referred patients must hold a valid Centrelink entitlement card (e.g. valid health care card or pension card). (Point 1.4)

- Orthodontic treatment will only be offered to those patients who are dentally fit and who maintain an excellent standard of oral hygiene.
- If a patient does not maintain excellent oral hygiene during treatment and does not respond to an improvement program, treatment may be discontinued.
- Patients must bring a valid health care card or pension card to every visit.
- Any patient with a severe classification is likely to be accepted for treatment.
- Any patient with a moderate classification should be referred and assessed for suitability.
- Any patient with a mild classification will not be accepted for treatment.
- Any patient falling into the 'Other' category may be referred for assessment.
- All patients accepted for orthodontic treatment who are assessed as requiring a combined orthodontic/surgical (orthognathic) treatment must be a self holder or whose parents/guardians are holders of valid Centrelink concession card at the time of Request For Admission for surgery. If the patient under orthognathic treatment is no longer the holder or dependant of a Health Card Holder, then the patient's orthognathic surgery may be treated as private or compensable and the patient or parents/legal guardian will be responsible for payment of all fees raised by the hospital and providers. Such fees may include medication, bed costs, special nursing, surgical plates and screws, anaesthesia fees etc.
- The referring clinician should be able to recognise the need for early interceptive treatments and facilitate these treatments which may prevent more serious orthodontic problems in the future.
- The patient should be at an appropriate stage of development for the proposed orthodontic care.

10.2 Index of Treatment Needs

An internationally recognised system of classifying need, the Index of Orthodontic Treatment Need (IOTN) has been adapted. It is presented in table format for ease of use and understanding by referring clinicians (refer to Table A).

Seven occlusal traits have been listed:
- overjet
- overbite
- crowding
- crossbite
- reverse overjet
- hypodontia
- open bite

For each trait, there is a description of severe, moderate and mild. This will determine whether the patient is accepted for treatment.

Table A: Orthodontic Treatment Needs

MALOCCLUSION	SEVERE (eligible)	MODERATE (Refer for opinion)	MILD (Not eligible)
Overjet	> 7 mm	5 – 7 mm	< 5 mm
Overbite	100% coverage of lower incisor or complete to palate	more than 70% coverage of lower incisor	up to 50% coverage of lower incisor
Crowding	> 9 mm per arch	5 – 9 mm per arch	< 5 mm per arch
Crossbite	anterior/posterior crossbite with: ▪ enamel loss ▪ gingival trauma and/or anterior/posterior crossbite with functional shift	anterior/posterior crossbite of more than 2 teeth and/or unilateral posterior crossbite	anterior/posterior crossbite of 1-2 teeth with no functional shift
Reverse overjet	Presence of reverse overjet	edge-to-edge	
Hypodontia	multiple missing teeth with major orthodontic implications	one tooth missing with moderate orthodontic implications	Hypodontia with no need for orthodontic treatment
Open bite Anterior or Posterior	>4 mm	2 – 4 mm	< 2 mm
Other	Impacted/ectopic teeth other than third molars severe skeletal malocclusions/orthognathic cases facial deformities/congenital abnormalities/cleft lip and palate (CLD)		

2. PAEDIATRIC DENTISTRY

All children and young persons (0-<18yrs) are eligible to be referred for paediatric specialist consultation, for the provision of non-admitted treatment and for admitted services for conditions outlined in 11.2.1 – 11.2.4.

However, only children and young persons who are self holders or whose parents/guardians are holders of a valid Centrelink concession card, are eligible for admitted paediatric dental specialty services for conditions outlined in 11.2.5 and 11.2.6.

Exemption to these eligibility criteria can only be made for patients for teaching purposes and those patients with special clinical needs as authorised by Clinical Directors of Local Health District Oral Health Services or their formally authorised delegate/s. For these cases a service charge may be applicable.

11.1 Key Referral Information

For children in Group 6 (Point 11.2.6 below), attempts should be made to treat them using behaviour management techniques prior to referral. Referrals in this category should document these attempts to demonstrate which techniques have been successful and which have not worked.

11.2 Index of Treatment Needs:

The sub-sections below list conditions for which specialist paediatric dental services are provided at Sydney Children's Hospitals Specialty Network (Randwick and Westmead), Sydney Dental Hospital and Westmead Centre for Oral Health.

11.2.1 *Group 1: Emergency Care*

phone the department directly if necessary for all children and young persons aged 0-17 years, including:

- facial swelling or acute oro-facial infection;
- haemorrhage;
- dento-alveolar trauma.

11.2.2 *Group* 2: *Children/Young persons*

whose medical condition or general health is threatened if dental care is not provided, such as but not limited to:

- congenital/acquired cardiac condition;
- oncology, and/or;
- haematological diseases.

11.2.3 *Group 3: Children/Young persons*

with severe/chronic disease and/or functional disability, or with special health needs, such as:

- intellectually or physically disabled;
- requiring frequent medications.

11.2.4 *Group 4*: *Children/Young persons*

with congenital or acquired malformations of the jaws, face or teeth, orofacial pathology, such as:

- craniofacial malformations, e.g. clefts of lip and/or palate;
- dental anomalies, such as amelogenesis imperfecta, multiple supernumerary teeth;
- dento-alveolar pathology such as cysts, ulcers.

11.2.5 *Group 5: Children 0-5 years*

at high caries risk, such as:

- early childhood caries (either white spot demineralisation or cavitated lesions);
- requiring management under general anaesthesia or sedation.

11.2.6 *Group 6: Children/Young persons*

with behaviour management difficulties, such as:

- children over 6 years of age with extreme dental anxiety requiring management under general anaesthesia or sedation.

3. PERIODONTICS

The criteria for referral of patients for periodontic services are:

- Assessment and management of periodontitis.
  - patients must demonstrate a commitment to good oral hygiene, smoking cessation and attendance at appointments.
- Specialist consultation for reasons other than periodontitis as follows:
  - pre-surgical consultations;
  - management of soft tissue lesions;
  - assessment for crown-lengthening;
  - management of oral manifestations of systemic disease;
  - assistance with treatment planning etc.

12.1 Key Referral Information

Patients with gingivitis only are generally not accepted for treatment in the specialist department.

4. PROSTHODONTICS

Referring practitioners are advised, when practical, to discuss the referral with a specialist before referring their patient. It is essential that the patient has received a course of comprehensive care to ensure no pathology remains and the only remaining treatment need is that for specialist consideration.

If there is found to be outstanding treatment needs other than those specifically addressed in the referral, these will be directed back to the referring clinic, resulting in delayed specialist treatment.

13.1 Key Referral Information

- Patients who have lost their dentures, who are dissatisfied with a recently fabricated denture or who have only one or two teeth missing do not need a specialist prosthodontic referral. These are general denture services which are within the capability and responsibility of Local Health Districts.
- The referring practitioner remains responsible for the oral health and well being of the patient, including pain relief during the waiting period. Provision of temporary restorations is essential to ensure the stability of the remaining dentition while awaiting a specialist appointment.
- Any additional laboratory costs arising from specialist treatment are to be borne by the patient. The patient must be made aware of this prior to the referral.
- Ocular prostheses (prosthetic eyes) are provided by ocular prosthetists and not by maxillofacial prosthodontic specialists.

13.2 Index of Treatment Needs:

Patients will be considered for:

13.2.1 *Fixed dental prosthodontics*

crown and bridge work for dentate and partially dentate patients, for example:

- excessive incisal/occlusal wear;
- coronal restoration of endodontically treated teeth;
- over-closed vertical dimension; and
- cases requiring cast-metal based dentures which are not responsive to local efforts.

13.2.2 *Removable prosthodontics*

in cases identified below:

- a history of serious problems, chronic clinical complaints or dissatisfaction where all generalist efforts have been exhausted, for example:
  - chronic non-retention;
  - chronic denture soreness; and
  - inability to wear an otherwise satisfactory prosthesis.
- A medical condition such as
  - undergoing head and neck radiotherapy;
  - salivary hypofunction/xerostomia;
  - severely atrophic maxillary or mandibular ridges;
  - flabby ridges;
  - severe gag reflex; and
  - significant anatomical defects such as mandibular or maxillary tori or cleft palate.

13.2.3 *Fixed and/or removable prosthodontics*
for complex cases involving
- precision attachments;
- osseo-integrated implants; and
- hybrid therapies.

13.2.4 *Complex cases may include:*
- gross occlusal wear not consistent with the patient's age;
- advanced tooth wear resulting from uncontrolled erosion, attrition, abrasion;
- occlusal collapse, or
- where restorative treatment will require multi-disciplinary management.

13.2.5 *Jaw function and oro-facial pain*
where there is no untreated pathology

13.2.6 *Chronic TMJ dysfunction*
it is essential that the referring practitioner has commenced occlusal splint therapy and advised the patient on other pain relieving actions, e.g moist heat packs when the case is acute.

13.2.7 *Specialist dental prosthetic treatment*
is provided to patients with oro-facial deformities, such as:
- intraoral - dentures, speech appliances or other appliances for alveolar resections, hard or soft palate fenestrations, cleft palate, mandibular resection and deviation, velo-pharyngeal incompetence, glossectomy of deformities resulting from surgical resection, reconstruction and/or radiotherapy;
- maxillo-facial - these mostly involve developmental or acquired facial disfigurement in which plastic surgery is contraindicated and a cosmetic prosthesis is required. Typically these cases involve an auricular, nasal or orbital prosthesis.

5. SPECIAL CARE DENTISTRY

The Referral Centres offer special services to a diverse client group with a range of disabilities and complex additional needs. This includes individuals and groups who have a physical, sensory, intellectual, mental, medical, emotional or social impairment or disability or, more often, a combination of a number of these factors.

14.1 Key Referral Information

- If the patient is unable to consent for his/her own dental treatment, the treatment plan will need to be discussed and consent for treatment signed by the legal guardian prior to commencement of care. Ability to consent must be noted in the referral and, if the patient does not self-consent, the name and address and contact details of the legal guardian must also be provided.
- A parent/carer/guardian is required to be present at all appointments for those patients who are unable to consent, or have significant physical or communicative disability.

14.2 Index of Treatment Needs

To achieve positive outcomes for the referred patient, the Referral Centres offer special services to address specific medical and/or social needs. These Referral Centres need the commitment of the patient/carer/parent/guardian to aspire to good oral hygiene[11] and attendance of appointments.

[11] Good oral hygiene is achieved by the effective removal of dental plaque through twice daily tooth brushing including interdental areas and using fluoride toothpaste and augmented with antimicrobial agents (eg. mouthwashes). Individuals must be instructed in the most appropriate technique of oral health care that includes professional feedback and reinforcement to prevent relapse and disease progression (Löe, 2000)

14.3 Special Care Dentistry Services

Specialist services are as follows:

- Persons with mental illness/disorder/condition or disability (behavioural, and/or intellectual) who are not suitable for routine dental care or are living in:
  - aged residential care (retirement villages) or nursing homes;
  - hostels, group homes or boarding houses;
  - the community with their families or with help from professional carer.
- Persons who are homeless.
- Persons with serious medical conditions.
- Persons with physical disabilities (unable to walk unattended by carers, or using wheelchairs, walking frames, callipers, scooter or other mobility aid.
- Persons with sensory disabilities of a severity which preclude routine attendance at Public Oral Health Clinics.

6. SHORTENED TERMS

ASA	American Society of Anaesthetists
CJD	Creutzfeldt-Jakob Disease
CLD	Cleft lip and palate
GA	General Anaesthesia
HIV	Human Immunodeficiency Virus
HIV/AIDS	HIV/Acquired Immune Deficiency Syndrome
IOTN	Index of Orthodontic Treatment Needs
OPG	Panoramic Radiograph
POHP	Priority Oral Health Program
SDH	Sydney Dental Hospital
TMJ	Temporomandibular Joint
WCOH	Westmead Centre for Oral Health

7. DEFINITION OF TERMS

Term	Definition
In-patient	Someone who stays overnight or for some time in a hospital for treatment or observation (Collins 2004 pg 198)
Non-admitted	The type of clinical service provided to a non-admitted patient in a non-admitted patient service event, such clinical services that are included are; allied health and/or clinical nurse specialist; dental; imaging; medical; obstetrics and gynaecology; paediatrics; pathology; pharmacy; psychiatric; surgical and emergency department (Australian Institute of Health and Welfare 2005)
Dental Caries	A chronic multifactorial life style based oral disease of microbial origin affecting the hard tissues of the tooth, commonly known as dental decay or cavities. Dissolution of the calcification tissues of the tooth by acid produced from ingested refined carbohydrates and micro-organisms in dental plaque. The process by which cavities are formed in teeth by gradual destruction of enamel and dentine. (Barnett, L.V 2000)

DENTAL AMALGAM CLINICAL USE AND DISPOSAL (GL2020_015)

GL2020_015 rescinded GL2011_002

GUIDELINE SUMMARY

This Guideline provides recommendations on the clinical use and the safe disposal of dental amalgam when treating patients in public dental clinics.

It is to be read with *NSW Health Clinical and Related Waste Management for Health Services* (PD2017_026).

KEY PRINCIPLES

NSW Health supports the specific measures outlined in the Minamata convention, by firstly improving oral health through systems and health promotion support, minimising the need for dental restorations. Where dental restorations are needed, current evidence-based approaches are supported, and cost-effective mercury free alternative materials are available to dental practitioners.

This Guideline also provides amalgam disposal practices to support environmental best practice to minimise the release of mercury compounds generated from dental clinics.

CLINICAL USE OF AMALGAM

Existing amalgam restorations remain safe and should not be removed or replaced with alternative restorative materials unless deemed strictly necessary by the dental practitioner. There is no evidence to justify the removal of dental amalgam restorations to relieve other systemic medical conditions or treat medical conditions (other than a proven allergy).

Cost effective, mercury-free alternative materials are available to dental practitioners to support modern evidence-based approaches to restorative care. These alternative materials should be favoured when treating patients who are pregnant, especially in the first trimester, breastfeeding mothers and those patients with severe renal disease and children under the age of 15.

Only pre-encapsulated amalgam is used when dental practitioners deem its necessity based on the specific medical and dental needs of the patient.

If placing or removing dental amalgam, clinical measures to reduce exposure to mercury vapour would include the use of rubber dam, ample water supply and evacuation.

WASTE MANAGEMENT OF DENTAL AMALGAM

The Minamata Convention on Mercury outlines measures to minimize the emission of mercury from dental practice into the environment to protect human health and the environment.

All clinics should be equipped with dental units that have amalgam waste traps that comply with ISO 11143.

Amalgam and amalgam-filled extracted teeth should not be placed in the ‘general’, yellow ‘contaminated’, or ‘sharps’ disposal containers, where contents are often incinerated.

Dental clinics should collect, store and ensure amalgam waste is sent to a licensed mercury waste processing facility for mercury recovery. These facilities recycle the mercury present in all the dental amalgam waste. If necessary, the Environment Protection Authority should be contacted for specific requirements for the disposal of mercury.

The Guideline can be downloaded from
https://www1.health.nsw.gov.au/pds/Pages/doc.aspx?dn=GL2020_015

EMERGENCY DEPARTMENT DENTAL REFERRALS (GL2023_005)

GL2023_005 rescinded GL2010_008

GUIDELINE SUMMARY

This Guideline provides direction on making appropriate dental follow-up referrals from NSW Health hospital Emergency Departments (EDs).

This Guideline is to be read in conjunction with the NSW Health Policy Directive *State Health Forms* (PD2009_072), NSW Health Policy Directive *Eligibility of Persons for Public Oral Health Care in NSW* (PD2017_027) and NSW Health Policy *Priority Oral Health Program (POHP) and Waiting List Management* (PD2017_023).

KEY PRINCIPLES

Dental conditions feature as a common reason for presentation to NSW Emergency Departments (ED). Information on the management of dental emergencies, within EDs can be accessed through the Agency for Clinical Innovation's Emergency Care Institute webpage on *Dental Emergencies*.

At the point of discharge some patients may require further dental care related to their initial presentation at the ED. Without adequate follow-up care, these patients may re-present to the ED.
Commonly this may include patients that have presented with:

- Dental trauma
- Swelling of the face or neck of dental origin
- Swelling in the mouth of dental origin
- Significant bleeding from a dental origin
- Difficulty opening jaw and/or swallowing as a result of a dental infection
- Difficulty breathing due to a swelling of dental origin.

A discharge summary is to be provided to the patient for follow up dental care. The patients discharge summary must include:

- Details about the presenting condition
- Test completed (such as imaging, blood pathology)
- Details about the management of the presentation and any medications administered

Some patients presenting to the ED may be eligible for a referral to NSW public dental clinics.

Patients requiring routine dental care should seek care from their private dental practitioner or at a NSW public dental clinic (eligibility criteria apply). Patients are eligible to access public dental clinics if they meet all section criteria, on the *Dental Referral for Emergency Departments to NSW Public Dental Clinics* form. This includes all children under 18 and adults with a Pensioner Concession Card, a Health Care Card or a Commonwealth Seniors Health Card. This criterion is also outlined in the NSW Health Policy Directive *Eligibility of Persons for Public Oral Health Care in NSW* (PD2017_027).

If a referral to a NSW public dental clinic is required, the state-wide form *Dental Referral for Emergency Departments to NSW Public Dental Clinics* is to be used. This form is to be given to the patient on discharge.

Contact details for public dental clinics are on the form. In most cases the patient will be required to contact the public dental clinics. Vulnerable or priority patients may require staff assistance. The patient is required to bring the form to their dental appointment.

The Guideline can be downloaded at
https://www1.health.nsw.gov.au/pds/Pages/doc.aspx?dn=GL2023_005

EARLY CHILDHOOD ORAL HEALTH GUIDELINES FOR CHILD HEALTH PROFESSIONALS, 3rd EDITION (GL2014_020)

GL2014_020 rescinds GL2009_017.

PURPOSE

The Early Childhood Oral Health Guidelines (the Guidelines) aim to improve the health and wellbeing of children in NSW by integrating oral health into general health interventions provided by child health professionals. The Guidelines add value to the NSW Personal Health Record, which includes oral health information for parents and a requirement to "lift the lip" and check for signs of dental disease during Child Health Checks.

KEY PRINCIPLES

The key principles of the Guidelines are that child health professionals should:

1. Advise pregnant women to visit a dentist for a dental examination and restoration of all active decay.
2. Provide preventive interventions to pregnant women and to new parents/caregivers.
3. Lift the lip of children aged 0-5 years to examine the upper front teeth and look for early signs of tooth decay (e.g. white or brown spots that don't brush off) and existing cavities.
4. Assess child's level of risk for oral disease. Provide preventive interventions to new parents/caregivers.
5. Advise parents/caregivers to reduce the frequency of sugar intake by limiting night time on-demand feeding after six months.
6. Advise mothers and carers to avoid transfer of oral bacteria to their child by maintaining good oral health themselves and by not placing food, utensils, dummies or teats into their own mouths and then into their child's mouth.
7. Provide dietary counselling to parents/caregivers that is specific to the child and their family and monitor compliance.
8. Provide oral hygiene and fluoride advice to parents/caregivers.
9. Provide information on teething to new parents/caregivers.
10. Provide an oral health assessment to a child by their first birthday.
11. Refer children at high risk for tooth decay to an Oral Health Call Centre, Early Childhood Oral Health Coordinator or Private Dentist.
12. Advise parents to talk to their children about dental visits in a positive way.
13. Provide oral health education for all child health professionals.

USE OF THE GUIDELINE

The Guidelines provide support material for child health professionals about oral health that complements their existing expertise by:

- Providing accurate oral health information to parents of children aged 0-5 years
- Assessing levels of oral disease risk for children aged 0-5 years
- Making decisions about appropriate referrals to oral health services.

To download the Guideline please go to
http://www.health.nsw.gov.au/policies/gl/2014/GL2014_020.html

EARLY CHILDHOOD ORAL HEALTH (ECOH) PROGRAM: THE ROLE OF PUBLIC ORAL HEALTH SERVICES (PD2013_037)

PD2013_037 rescinds PD2008_020.

PURPOSE

Oral Health is essential for health and wellbeing and early childhood is the time when most lifetime habits are established. It offers the greatest opportunity for prevention of disease, which, in turn, can contribute to better health in adulthood. This policy sets the framework for Public Oral Health Services in NSW to work collaboratively with key partners to implement the Early Childhood Oral Health Program in order to improve the oral health of the population.

MANDATORY REQUIREMENTS

- All child health professionals receive core oral health training and have access to regular periodic updates in oral health.
- All members of the oral health team are educated and trained to address the issues of children aged 0-5 years and are responsive to the prioritisation process for children who are at risk of Early Childhood Caries (ECC), including siblings.
- Referral information and supporting resources are available and accessible to child health professionals.
- Culturally appropriate oral health information and resources are available to Aboriginal people.
- Child health professionals who refer children receive timely feedback from the treating oral health professional.
- Administrative structures and procedures support the referral and feedback processes.

IMPLEMENTATION

An overview of responsibilities of key parties required in implementing this policy:

Centre for Oral Health Strategy (COHS) NSW:

- Develop, promote and review state-wide resources & training packages.
- Engage with Aboriginal Health personnel and communities in the development of culturally specific resources.
- Promote education of oral health personnel in early childhood oral health.
- Maintain a high level of consultation & liaison with key stakeholders.
- Monitor ECOH Program uptake.
- Monitor oral health outcomes.

LHD Oral Health Managers and Clinical Directors:

- Allocate adequate resources to implement and sustain the ECOH program.
- Support ongoing professional development for oral health staff.
- Prioritise 0-5 year olds and all eligible family members, who are in the ‘high risk’ category.
- Focus actions on higher risk groups, such as Aboriginal communities and others as identified by epidemiological and/or socio-demographic data.
- Ensure that administrative structures and procedures support referral, appointment, treatment and feedback processes where appropriate.
- Provide preventive information, resources and treatment to improve the oral health status of high risk groups.
- Ensure all children referred by a child health professional are enrolled in the Information System for Oral Health (ISOH).

ECOH Coordinators (or delegated Oral Health Professional):

- Train and provide periodic updates for child health professionals, including Aboriginal Health personnel.
- Distribute ECOH resources & relevant supporting information to both child health professionals and public oral health professionals.
- Monitor ECOH program uptake at the LHD level.
- Train oral health teams in ECOH prioritisation and appointment protocol.
- Participate in ECOH professional development sessions.
- Build collaborative LHD partnerships between oral health and general health professionals.
- Provide timely and accurate reports to LHD Management and to COHS.
- Provide timely feedback to referring agents.

Oral Health Clinicians:

- Provide timely feedback to referring professionals/agencies.
- Implement a family centred model of oral health care that recognises eligible family members for dental treatment where one family member has been referred for prevention and early intervention under the ECOH Program.
- Distribute resources and relevant material that support the ECOH program to parents/carers of young children.
- Liaise with and support the ECOH coordinator and participate in ECOH professional development sessions.

Oral Health Intake/Reception:

- Prioritise referrals from the ECOH Program.
- Record all children who enter the oral health service with a referral from a child health professional as a referral during their Priority Oral Health Program (POHP) triage in ISOH.
- When required, liaise with ECOH coordinators, child health professionals and oral health clinicians as required to facilitate a family centred approach to oral health care.

1. BACKGROUND

Early childhood caries (ECC) is a serious dental condition occurring during the preschool years of a child's life when developing primary (baby) teeth are especially vulnerable. ECC can occur as soon as the first tooth erupts. During the first 12 months post-eruption susceptibility of teeth to decay is high.

It can be a devastating condition often requiring hospitalisation and dental treatment under general anaesthesia (GA). The majority of children on GA waiting lists in NSW are under the age of 5 years. In 2010 - 2011, 1,509 children aged between 0-4 years of age received dental treatment under general anaesthesia in NSW[13].

The pain, psychological trauma, health risks, and costs associated with restoration of carious teeth for children affected by ECC can be substantial.

Family circumstances, such as low socio-economic background, increase the risk of ECC. Thus, to be more effective and efficient, a holistic family-oriented approach is necessary.

The evidence strongly shows that ECC is one of the few chronic diseases that, if preventive messages are implemented, can be mostly prevented.

[13] Centre for Epidemiology and Evidence. Health Statistics New South Wales. Sydney: NSW Ministry of Health. Available at www.healthstatus.nsw.gov.au Accessed (Thursday, 4 April 2013).

Oral health checks are recommended during child health checks at 6-8 months, 12 months, 18 months, and 2, 3 and 4 years of age[14].

2. DEFINITION OF EARLY CHILDHOOD CARIES (ECC)

The disease of ECC is defined as "the presence of 1 or more decayed (non-cavitated or cavitated lesions), missing (due to caries), or filled tooth surfaces" in any primary tooth in infants and preschool children[15]. In children younger than 3 years of age, any sign of smooth-surface caries is indicative of severe early childhood caries. Major contributing factors include prolonged and/or frequent bottle feeding, especially at night.

3. ASSOCIATED DOCUMENTS

This Policy Directive should be read in association with the following documents:

- Early Childhood Oral Health Guidelines for Child Health Professionals, 3rd Edition: GL2014_020.
- Pit and Fissure Sealants: Use of in Oral Health Services in NSW: PD2013_025.
- Oral Health – Eligibility of Persons for Oral Health Care in NSW: PD2009_074.
- Priority Oral Health Program and List Management Protocols: PD2008_056.

It should also be consistent with whole of government policies & plans:

- Healthy Mouths Healthy Lives: Australia's National Oral Health Plan 2004-2013
- National Partnership Agreement on Closing the Gap in Indigenous Health Outcomes Implementation Plan
- National Partnership Agreement for Oral Health
- Oral Health 2020: A Strategic Framework for Dental Health in NSW
- Department of Health and Aging MBS Primary Care Items: Healthy Kids Check

4. PRINCIPLES

4.1 Oral health is essential for health and well-being and must be integrated into the 'general' health agenda.

4.2 Poor oral health can have a serious impact on quality of life and good oral health in infancy and early childhood contributes to better health in adulthood.

4.3 Dental caries is a multifactorial disease and in early childhood is linked strongly to family behaviours and practices. Oral health services need to prioritise all eligible family members where one child is at high risk.

4.4 Intervening early makes good economic sense. Interventions targeted at young children will have much higher economic returns than later interventions. Policies that focus on the treatment of established problems or conditions are not sustainable.

4.5 Primary teeth are important for normal development, function and health. If children lose their primary teeth too early there can be an adverse effect on self-esteem, eating and the position of the adult teeth.

4.6 Generally, child health professionals[16] have more opportunities to engage with and influence new parents, and to conduct risk assessments, than do oral health professionals.

[14] "My First Health Record" Personal Health Record, NSW Health 2007. SHPN (PHCP) 060174 ISBN 1741870178.
[15] American Academy of Paediatric Dentistry.
[16] Any health professional who works with children, including General Practitioners, Paediatricians, Child & Family Health Nurses, Aboriginal Health Workers, Speech Therapists, Dieticians, Drug and Alcohol Workers, and others as identified.

5. IMPLEMENTATION PLAN

Training

Procedure	Who	When	How
• Provide child health professionals, including Aboriginal Health personnel, with core ECOH Program training and annual oral health updates	ECOH Coordinators	When required	Train the trainer model developed by COHS.
• Provide oral health teams with professional development in early childhood oral health	COHS	In conjunction with ECOH Program roll-out	Regional in-services, supported by DVD
• Provide oral health teams with training in referral and feedback procedures	ECOH Coordinators	Prior to implementation. Include in AHS orientation & training programs	Develop local LHD protocols
• Provide ECOH Program participants with access to supporting state-wide policies, guidelines and resources	COHS	As appropriate	ECOH Policy Directive, evaluation of resources, development of culturally specific resources for Aboriginal and CALD communities

Referral and feedback

Procedure	Who	When	How
• Check the mouth and assess the risk for dental disease in children aged 0-5, following participation in ECOH Program training	Child health professionals	Child Health Checks and other opportunistic interventions	As per ECOH guidelines
• Document findings and refer children at risk of dental disease to oral health services, using either paper-based or electronic referral system		Following identification of risk of dental disease	Use referral template provided in ECOH guidelines
• Prioritise referrals from the ECOH Program	Oral Health Services	First client contact	Through the Priority Oral Health Program (ISOH) referral protocols
• Routinely collect statistics on total number of referrals received	Oral Health Services	Quarterly	Through LHD data collection processes
• Provide timely feedback to referring professionals/agencies	Oral Health Professional	Following the child's appointment	Develop local LHD protocols

Monitoring

Procedure	Who	When	How
• Record all children who enter the oral health service with a referral from a child health professional as a referral during their Priority Oral Health Program (POHP) triage	Oral Health Services	During POHP triage	Tick "Do you have a referral from an NGO, Community Health, GP, DoCS?"
• Monitor ECOH Program uptake • Report to COHS in a timely and uniform manner	Oral Health Managers & ECOH Coordinators	Quarterly	Through LHD data collection processes
• Monitor the number of families participating in the ECOH program	Oral Health Services, COHS	As appropriate	Refer to Waiting list protocol. Participation in population oral health surveys
• Develop an indicator that identifies ECOH referrals	COHS	After general release of ISOH version 7	Through ISOH

PRIORITY ORAL HEALTH PROGRAM (POHP) AND WAITING LIST MANAGEMENT (PD2017_023)

PD2017_023 rescinds PD2008_056.

PURPOSE

This policy directive outlines the processes of dental triage, clinical assessment, and waiting list management for NSW residents who access public oral health services.

MANDATORY REQUIREMENTS

Public oral health services managed by NSW Local Health Districts (LHD) and Specialty Networks (SN) must prioritise and manage patient flows according to the processes set out in this Policy Directive.

IMPLEMENTATION

Chief Executives are responsible for:

- Ensuring that this Policy Directive is implemented throughout the Local Health District/Specialty Health Network.
- Supporting the efficient and equitable delivery of oral health services including proactive management of demand.
- Regularly evaluating oral health service performance and ensuring that relevant reporting requirements are met.
- Ensuring that oral health services communicate effectively with patients and carers and treat all clients with respect and dignity.

Oral Health Service Clinical Directors and Service Managers are responsible for:

- Ensuring that clear administrative and clinical procedures are in place to facilitate the implementation of the Policy Directive.
- Conducting quality assurance activities to ensure that the triage, clinical assessment and waiting list management procedures and timeframes outlined in this Policy Directive are adhered to.
- Ensuring that excellent customer service practices are in place to facilitate effective and timely communication with patients. All patients and carers must be treated with respect and dignity.

Oral Health Contact Centre Staff are responsible for:

- Ensuring that excellent customer service practices are in place to facilitate effective and timely communication with patients. All patients and carers must be treated with respect and dignity.
- Ensuring that all patients are triaged in accordance with this Policy Directive.
- Ensuring that patient encounters are documented accurately and appropriately.

Dental Practitioners are responsible for:

- Complying with the procedures and clinical criteria set out in this Policy Directive.
- Prompt and appropriate communication with referring Medical Practitioners regarding the management of a referred patient.
- Contributing to the performance of the oral health service by providing services to patients in an efficient, conscientious manner.
- Providing excellent customer service to patients and carers.
- All patients and carers must be treated with respect and dignity.

Referring Health Practitioners are responsible for:

- Ensuring that adequate demographic and clinical details are provided when referring patients to oral health services.
- Initiating prompt and appropriate communication with oral health services should there be a change in indications for treatment or change in a patient's health with implications for treatment.

Patients and carers should:

- Seek public dental care by telephoning an oral health contact centre for triage.
- Inform the oral health contact centre of any change in patients' oral health complaint.
- Attend pre-treatment appointments as required by the oral health service (such as a clinical assessment appointment) and attend all appointments for treatment.
- Clearly communicate with oral health service staff:
    - Any change of address or other contact details
    - Inability to attend an appointment
    - Any change in decision to undergo a procedure

1 BACKGROUND

1.1 About This Document

The Priority Oral Health Program and Waiting List Management Policy Directive has been developed to promote clinically appropriate, consistent and equitable management of patient access and waiting lists in NSW public oral health services.

1.2 Introduction

There is no Commonwealth scheme similar to Medicare that provides universal access to dental services. NSW Health provides a public dental system offering a range of services to children as well as adults who meet the eligibility criteria outlined below.

All children under 18 years of age in NSW are eligible for general dental services. To be eligible, adults must hold or be listed as a dependent on one of the following valid Australian Government concession cards:

- Health Care Card,
- Commonwealth Seniors Health Care Card or
- Pensioner Concession Card (includes Centrelink and Department of Veteran Affairs).

These criteria are outlined in more detail in the NSW Health *Eligibility of Persons for Public Oral Health Care in NSW* policy directive (PD2016_050).

Providing oral health care to eligible patients and the effective management of waiting lists is a priority for the Government and NSW Health. Public dental services are provided according to criteria that prioritise emergency situations, as well as patient groups in most need and at highest risk of disease.

Access to public dental services is mostly via an oral health contact centre, through which eligible patients are triaged and given a clinical priority depending on the seriousness of their condition. There is high demand for public dental services and therefore priority is given to the treatment of patients with urgent conditions within clinically appropriate timeframes. Patients with non-urgent conditions may be required to wait on a waiting list for care.

It is recognised that a patient may need to be re-triaged if their condition changes or deteriorates while on a waiting list. At the time of triage, patients and/or carers should be informed of what to do if their condition changes or they become concerned while waiting for care.

Patients and/or carers who are concerned about urgent medical conditions at point of contact should be encouraged to seek appropriate care through a General Practitioner, Aboriginal Medical Service or Hospital Emergency Department.

NSW Health services must actively manage access to oral health services in compliance with the contents of this document.

1.3 Key Definitions

Term	Definition
"must"	Indicates a mandatory action requiring compliance by staff at public health facilities, in accordance with a legislative requirement and/or policy directive.
"should"	Indicates a recommended action that should be followed unless there is a sound reason for taking a different course of action.
Adult	A person 18 years of age or over.
Assessment appointment	An appointment where the treating practitioner diagnoses the patient's clinical condition and may provide treatment to stabilise the condition. The patient may then be assigned to an appropriate waiting list.
Assessment waiting list	A waiting list that patients are placed on after triage until an assessment appointment is made.
Assessment waiting time	Waiting time between the date the patient is placed on the assessment waiting list and the date an offer of care is made and/or the date they attend an assessment appointment.
Child	A person less than 18 years of age.
Comprehensive course of care	An appointment or series of appointments following a comprehensive examination (usually item number 011 or 012) that addresses all of the patient's oral health needs.
Episodic course of care	A limited course of care provided with the intent of only addressing a specific, clinically urgent patient presentation (usually following a limited examination, item number 013).
Failure to Attend (FTA)	A patient has failed to attend a scheduled appointment when they: a) Do not arrive prior to the appointment time; or b) Do not ring to cancel the appointment
Oral health emergency	An oral health emergency is defined as dental trauma or injury; significant bleeding in the mouth; swelling of the face; swelling in the neck or mouth; or acute difficulty opening jaw and/or mouth. Dental pain by itself is not considered an oral health emergency.

Term	Definition
Practitioner	Dental Hygienist, Dental Officer, Dental Therapist, Oral Health Therapist, Dental Prosthetist or Specialist Dentist working in public oral health services.
Recall waiting list	The recall waiting list is only for patients waiting for treatment review of a specific clinical need within a defined timeframe where follow up dental care is required.
Recommended Maximum Waiting Time (RMWT)	A waiting period that oral health services must attempt not to exceed prior to an offer of care or an appointment being made. A RMWT is specified for all assessment and treatment waiting lists.
Specialist services	Services provided by a dental practitioner who is registered with the Dental Board of Australia as a specialist in a recognised oral health speciality.
Specialised services	Services provided by an oral health practitioner who has had specialised training or experience.
Treatment waiting list	A list that patients are placed on to wait for an appointment for a comprehensive course of care.
Treatment waiting time	Waiting time between the date the patient is placed on the treatment waiting list and the date a treatment appointment is made.
Triage	A phone or face-to-face interview using standard questions designed to determine a patient's oral health needs.

2 GENERAL DENTAL AND ORAL HEALTH SERVICES

2.1 Contact and Triage

Triage is the systematic prioritisation of patients according to the urgency of their need for care and is used to allocate oral health assessment and treatment priorities. Triage is an integral feature of the NSW Health system and allows limited resources to be allocated on the basis of clinical need and socioeconomic risk-factors. More information regarding triage can be found in the *Triage of Patients in NSW Emergency Departments* policy directive (PD2013_047).

All patients seeking access to public oral health services must be triaged by telephone, in person or by correspondence via a Local Health District or Specialty Health Network oral health contact centre. The patient is triaged and assigned an assessment priority code and then either wait listed or given an appointment, depending on the priority assigned and service capacity. A patient's triage priority is determined by a number of criteria including clinical condition, acuteness of any symptoms, and socioeconomic factors. The triage process utilises a standardised questionnaire, resulting in a triage code. The triage code will be assigned according to the patient's highest priority condition.

In addition to the telephone triage, patient referrals can be received from medical and allied health practitioners and through Local Health District/Specialty Health Network-specific strategies for priority populations (e.g. Early Childhood Oral Health, Out of Home Care).

2.1.1 Re-Triage Of Patients with Deteriorating Conditions

It is recognised that a patient may need to be re-triaged if their condition changes, deteriorates or additional relevant information is received. The purpose of re-triage is to acknowledge any change in clinical condition of the patient and reassign a new triage category if appropriate. Patients and/or carers should be informed at the time of triage what to do if their condition changes or they become concerned while waiting for care.

2.1.2 Telephone Advice

Oral health contact centre staff cannot provide clinical advice to the public. If the caller is requesting oral health clinical information, a senior dental practitioner may be asked to speak with the caller if available.

If the Triage Officer identifies that a caller requires general medical advice they should direct the caller to phone their General Practitioner or call the National Triage Telephone Advice Line (*Healthdirect Australia*) on 1800 022 222.

If the Triage Officer identifies that the call may be a medical emergency, they should direct the caller to hang up and phone 000 for assistance.

If the Triage Officer identifies that a caller is ringing about a mental health problem, they should direct the caller to phone the NSW Mental Health Line on 1800 011 511.

2.1.3 Rationale For Recommended Maximum Waiting Times

The *Priority Oral Health Program and Waiting List Management* policy directive has been developed to promote clinically appropriate, consistent and equitable management of oral health patients and waiting lists in NSW public oral health services and has been approved by the State Oral Health Executive Committee (SOHE).

Categorisation of both children and adult oral health patients by clinical priority is required to ensure they receive care in a timely and clinically appropriate manner. The priority codes and associated criteria are detailed in sections 2.1.4 Adult Triage Codes and 2.1.5 Child Triage Codes of this document.

The recommended maximum wait times used throughout this document are considered clinically appropriate in consideration of the likelihood of the patient's condition to:

- Deteriorate quickly to the point that it may become an emergency, or
- Impact on other medical conditions, or
- Impact the patient's general health and well-being

If a patient has a condition that has the potential to deteriorate quickly or become an emergency, they will be prioritised for care over a patient whose condition has less potential to become an emergency.

2.1.4 Adult Triage Codes

Priority	Adult Triage Criteria	Recommended Maximum Waiting Time
1*	• Patients with dental trauma or injury • Patients with symptoms of suspected dental origin that may include: o Swelling of the face or neck o Swelling in the mouth o Significant bleeding from the mouth o Difficulty opening jaw and/or swallowing ** Priority 1 patients should be given the earliest possible appointment and concurrently advised to attend an emergency department if they experience an acute deterioration prior to their appointment, or to seek medical attention if otherwise concerned.*	**24 hours**
2	Patients referred from a specialist medical practitioner requiring specific life-saving medical care (e.g. radiotherapy, chemotherapy, organ transplant, heart surgery or urgent assessment for specialist service)	**3 days**
3a**	• Patients with pain of suspected dental origin causing disturbed sleep • Patients who have had an ulcer for 3 weeks or more ***Priority 3a patients should be given an appointment, and concurrently advised to consider seeking medical attention from a general practitioner if their condition deteriorates, or to re-contact the contact centre to be re-triaged.*	**1 week**
3b^	• Patients with pain of suspected dental origin during waking hours *^Priority 3b patients should be given an appointment or waitlisted, and concurrently advised to consider seeking medical attention from a general practitioner if their condition deteriorates, or to re-contact the contact centre to be re-triaged.*	**1 month**
3c	• Patients who have a denture request involving missing upper front teeth that is required because: o There is no existing denture, **OR** o The existing denture causes pain, **OR** o The existing denture falls out while talking • Patients who are pregnant	**3 months**

4. DENTAL CARE **4.71**

Priority	Adult Triage Criteria	Recommended Maximum Waiting Time

4	For adult patients who meet one or more of the criteria below:
	• Has a serious medical condition **AND**:
	  o Takes medication regularly for this medical condition, **OR**
	  o Sees a doctor regularly for this medical condition, **OR**
	  o Has been hospitalised in the last 12 months for this medical condition
	• Has a physical or intellectual disability
	• Uses a wheelchair or is unable to leave home
	• Patient has the following living conditions:
	  o Homeless
	  o Boarding house/refuge/rehabilitation facility
	  o Institution/group home
	  o Care facility (hospice/aged care facility)
	• Arrived as a refugee within the last 12 months
	• Identifies as an Aboriginal and/or Torres Strait Islander
	• Referred from a medical practitioner
	• Referred from an Aged Care Assessment Team (ACAT)
	• Meets the criteria for a LHD-specific referral pathway
		6 months

5	For adult patients requesting a check-up with one of the following concerns: • Extractions • Needs fillings or complains of a broken filling • Broken or chipped tooth • Bleeding or sore gums • Loose teeth • Other denture requests including broken plate or clasp • Ulcers for less than three weeks^^ • Crown and bridge • Scale and clean • Clicking/grating in jaw joint • Halitosis (bad breath) ^^*these patients will be given an appointment or placed on a waitlist and at the same time advised to see their medical practitioner for symptomatic management and to assess for medical causes of mouth ulceration.*	**12 months**
6	For patients who request a check-up without any of the above concerns.	**24 months**

2.1.5 Child Triage Codes

Priority	Child Triage Criteria	Recommended Maximum Waiting Time
1*	• Dental trauma or injury • Symptoms of suspected dental origin that may include: o Swelling of the face or neck o Swelling in the mouth o Difficulty opening jaw and/or swallowing o Significant bleeding from the mouth o Fever and/or refusing food and fluids ** Priority 1 patients should be given the earliest possible appointment and concurrently advised to attend an emergency department if they experience an acute deterioration prior to their appointment, or to seek medical attention if otherwise concerned.*	**24 hours**
2	Referral from a specialist medical practitioner for patients who require specific life-saving medical care (e.g. radiotherapy, chemotherapy, organ transplant, heart surgery or urgent assessment for specialist service)	**3 days**
3a**	• Symptoms of suspected dental origin that may include: o Swelling in the mouth o Pain in the mouth causing disturbed sleep o Ulcers in the mouth ***Priority 3a patients should be given an appointment, and concurrently advised to consider seeking medical attention from a general practitioner if their condition deteriorates, or to re-contact the contact centre to be re-triaged.*	**1 week**
3b^	• Pain in the mouth during waking hours *^Priority 3b patients should be given an appointment or waitlisted, and concurrently advised to consider seeking medical attention from a general practitioner if their condition deteriorates, or to re-contact the contact centre to be re-triaged.*	**1 month**

4. DENTAL CARE 4.73

Priority	Child Triage Criteria	Recommended Maximum Waiting Time
3c	• Children 0-5 years of age • Referral from the Department of Family and Community Services (FACS) or Agency providing services to children under temporary care (includes Out Of Home Care). • Symptoms of suspected dental origin that may include: o Decayed tooth (may need filling or extraction) o Minor bleeding or sore gums o Over-retained primary tooth o Severe crowding affecting speech/eating o Broken or chipped tooth o Broken or chipped filling	**3 months**
4	For child patients who meet one or more of the criteria below: • Has a serious medical condition **AND**: o Takes medication regularly for this medical condition, OR o Sees a doctor regularly for this medical condition, OR o Has been hospitalised in the last 12 months for this medical condition. • Has a physical or intellectual disability. • Uses a wheelchair or is unable to leave home. • Patient reports one of the following living conditions: o Homeless or Out of Home Care o Refuge/rehabilitation facility o Institution/group home • Arrived as a refugee within the last 12 months. • Identifies as an Aboriginal and/or Torres Strait Islander. • Meets the criteria for a LHD-specific referral pathway.	**6 months**
5	• For patients requesting a check-up with one of the following concerns: o Loose teeth o Crowded teeth o Halitosis (bad breath) o Scale and clean • Child has a referral letter from: o Aboriginal Health Services (e.g. LHD AHW) o Aboriginal Community Controlled Health Services o Child and Family Health Nurse o Medical Practitioner o Practice Nurse o Private Dentist o Public Health Service (e.g. Allied Health, Maternity, Public Hospital)	**12 months**
6	For patients who request a check-up without any of the above concerns.	**24 months**

2.2 Clinical Assessment

A clinical assessment is performed by a dental practitioner to confirm the clinical care priority of the patient. When the clinical care requirements of the patient are confirmed by the practitioner, one of the following courses of actions can occur:

a) An episodic course of care is provided, then the course of care is closed.

b) An episodic course of care is provided, then the course of care is closed and the patient is placed on a waiting list for other treatment needs.

c) The patient is placed on a treatment waiting list for their treatment needs.

d) No treatment is required.

2.3 Treatment Pathways

2.3.1 Episodic Care

The scope of episodic care is to provide relief of pain, treatment of infection, or to address dental trauma only.
Episodic care is provided after clinical need has been confirmed at the clinical assessment appointment, either at a public dental clinic or through the Oral Health Fee for Service Scheme (OHFFSS). In some limited circumstances, such as when a dental practitioner is not available to provide a clinical assessment, an OHFFSS voucher may be issued. More information about the OHFFSS can be found in NSW Health Policy Directive PD2016_018.

2.3.2 Comprehensive Care

The scope of comprehensive care is to address all treatment needs of the patient, as appropriate.

All adults should be offered a course of comprehensive care after coming off a treatment waiting list. Where possible, children should receive a full comprehensive course of care after being appointed from triage. LHD/SN’s must use the definitions of the codes and clinical criteria outlined in the tables below.

2.3.3 Adult General Dental Treatment Waiting List Codes

Priority Code	Clinical Categorisation	Criteria	Recommended Maximum Waiting Time
A	Confirmed Medical Priority	The patient has been referred from a medical practitioner who has requested a dental examination preceding treatment for a medical condition. The condition should be of equal significance to: • Head and neck cancer • Other cancers that require radiotherapy, chemotherapy or significant immunosuppression • Transplant surgery • Cardiac surgery • Intravenous antiresorptive therapy	**2 weeks**
B	Pregnancy	The patient presents with poor oral health during pregnancy.	**3 months**
C	Chronic Disease/ Medically Compromised*	• At risk of developing endocarditis • At risk of developing medication-related osteonecrosis of the jaw • Has a significant psychiatric illness (e.g. requiring recent hospitalisation) • Dementia • Degenerative diseases • Has coagulopathy • Is living with HIV • Patient has poorly controlled diabetes • Patient has Special Needs • Significant Salivary hypofunction • Organ transplants / immunosuppressed **Other conditions of equal clinical significance may be considered in consultation with a Clinical Director.*	**6 months**

Priority Code	Clinical Categorisation	Criteria	Recommended Maximum Waiting Time
D	Urgent Denture Needs	The patient is confirmed to have urgent denture needs due to: • No existing denture and missing maxillary anterior teeth • Existing maxillary denture that is displaced whilst speaking • No existing maxillary denture with social impairment, or where lack of denture will result in damage to supporting structures	**9 months**
E	High Treatment Needs	• Three or more teeth present with carious lesions • Periodontal Screening & Recording Code 3 or greater • All other denture needs not included in Code D	**12 months**
F	Low Treatment Needs	• All other assessed treatment needs	**24 months**

2.3.4 Child General Dental Treatment Waiting List Codes

Priority Code	Clinical Categorisation	Criteria	Recommended Maximum Waiting Time
A	Confirmed Medical Priority	Situations where failure to provide dental treatment would delay the commencement or progress of urgent medical treatment.	**2 weeks**
B	Urgent Treatment Needs	• Special need patients who have extensive treatment needs • Dental anomalies are present that require management • Dental anomalies are present in the permanent dentition	**3 months**
C	High Treatment Needs	• Carious lesions and/or periodontal disease are present	**6 months**
D	Low Treatment Needs	• All other assessed treatment needs	**12 months**

3 SPECIALIST / SPECIALISED ORAL HEALTH SERVICES

LHD/SN's may operate specialist and/or specialised child and adult services that are prioritised according to the tables below. Specialist and specialised services are those identified in the *Oral Health Specialist Referral Protocols* Policy Directive (PD2011_071). The clinical priority categories in the tables below align with the Australian National definitions for elective surgery urgency categories.

It is recognised that there may be slight variation in the waiting times for different specialties based on clinical staging.

3.1 Specialist/Specialised Dental Referral Waiting List Codes

Priority	Definition	Recommended Maximum Waiting Time
1	Assessment clinically indicated within 7 days	**7 days**
2	Assessment clinically indicated within 30 days	**30 days**
3	Assessment clinically indicated within 90 days	**90 days**
4	Assessment clinically indicated within 365 days	**365 days**

3.2 Specialist/Specialised Dental Treatment Waiting List Codes

Priority	Definition	Recommended Maximum Waiting Time
X	Procedures clinically indicated within 30 days	**30 days**
Y	Procedures clinically indicated within 90 days	**90 days**
Z	Procedures clinically indicated within 365 days	**365 days**

4 MANAGED CARE PROGRAMS

Managed care programs seek to improve health outcomes for particular patient groups. Adults and children who receive care under managed care programs may be placed on a recall list. Recall lists are only for patients that need review of a specific clinical need within a defined timeframe.

It is recommended that patients who require recall are allocated only by dental practitioners following a course of care, consultation or referral/review.

Local guidelines should be established to ensure a structured approach to managed care.

5 ADMINISTRATIVE PROCESSES

5.1 Movement of Patients between Local Health Districts

When a patient moves to a locality serviced by another LHD/SN:

- The previous LHD/SN oral health service must advise the receiving service of the patient's current waiting list status, if requested; and
- The transferred waiting list status must include the original listing date to avoid disadvantaging the patient.

Due to funding and reporting arrangements, oral health care will normally be provided by the LHD/SN in which a patient lives. However, LHD/SN's may have inter-district arrangements that allow for patients to receive care in a bordering district to facilitate accessibility to an appropriate service.

5.2 Management and Auditing Of Waiting Lists

Managing waiting lists is a key priority for the Government and NSW Health. LHD/SN's should have appropriate staff training programs, protocols and processes in place to ensure a high standard of data quality is maintained within oral health information systems.

Waiting list monitoring should be undertaken on a regular basis (at least monthly).

Measures should be put in place to ensure that documentation provides a clear audit trail that can identify:

- Any changes made to a patient's wait list status and type
- Patients who have completed their treatment and should be removed from the waiting list
- Duplicate list entries
- Whether waiting times are within timeframe

Any one patient should only be waiting on one type of treatment waiting list (the highest priority that they meet the clinical criteria for) at any point in time.

5.3 Missed or Cancelled Appointments.

1.	Type of Non-Attendance	2.	Definition
3. 4.	**Failure to Attend (FTA)**	5. a) b)	A patient has failed to attend a scheduled appointment when they: do not arrive prior to the appointment time; or do not ring to cancel the appointment (Refer to UTA)
6. 7.	**Unable to Attend (UTA)**	8.	A patient or carer has notified the service prior to the appointment time that the patient will not be able to attend for the appointment. The patient's reason for nonattendance should be documented.
9. 10.	**Dental Organisation Cancelled Appointment (DOC)**	11.	The oral health service cancels or reschedules an appointment. An apology and explanation should be given to the patient in these circumstances.

- Local processes should be implemented to minimise/manage non-attendance.
- Patients must be fully informed that a requirement for ongoing care is to inform the oral health service if they are unable to attend their scheduled appointment.
- A patient who has two (2) FTA appointments during a course of care may have their course of care discontinued. The LHD/SN should exercise discretion on a case by case basis to avoid disadvantaging patients in cases of a genuine hardship, misunderstanding and other unavoidable circumstances.
- LHD/SN's should have an active strategy to identify and assist vulnerable persons who regularly fail to attend (FTA) appointments without adequate prior notification, for example people with a mental illness, the frail and aged, and people experiencing homelessness.
- When the patient contacts the oral health contact centre after an FTA they may be required to re-register their oral health needs via a POHP triage. Local LHD/SN policies regarding patients who FTA their appointments should be complied with.

SMOKING CESSATION BRIEF INTERVENTION IN ORAL HEALTH SETTINGS (PD2021_016)

PD2021_016 rescinds PD2021_014 and PD2015_030

POLICY STATEMENT

Tobacco smoking is a leading cause of preventable chronic disease, including periodontitis and oral pharyngeal cancer, and premature death in Australia. Tobacco use is more prevalent in disadvantaged groups who are served in public oral health settings. Dental practitioners and dental assistants in NSW public oral health settings can play a pivotal role in engaging with patients and supporting them to modify their risk practices. Dental practitioners must consider providing brief advice and support to patients, through smoking cessation brief interventions as appropriate to the clinical situation.

SUMMARY OF POLICY REQUIREMENTS

Dental practitioners and dental assistants are expected to be appropriately trained in delivering smoking cessation brief interventions. Mandatory training is available via *My Health Learning*.

All patients aged 14 years and over are to have their use of tobacco or other similar substances assessed and recorded in the oral health record, unless doing so would be clinically inappropriate.

Where the setting is appropriate, all patients who smoke are to be approached in a nonjudgmental way about their smoking and be provided advice to quit. Dental practitioners must record the smoking cessation advice offered in the patient's oral health record.

Consenting patients are to be offered a referral to a smoking cessation support service. Oral health executives must ensure that supporting resources are available. Local health districts and the Ministry of Health are to monitor local smoking cessation brief intervention activities.

Go to https://www1.health.nsw.gov.au/pds/Pages/doc.aspx?dn=pd2021_016 to view the Smoking Cessation Brief Intervention in Oral Health Settings Policy and Procedures.

ORAL HEALTH: CLEANING, DISINFECTING AND STERILISING (PD2013_024)

PD2013_024 rescinds GL2005_037.

The purpose of this policy directive is to provide minimum standards for cleaning, disinfecting and sterilizing in oral health care settings for the maintenance of a safe and healthy environment for patients, visitors and staff. This policy must be read in conjunction with NSW Health Infection Control Policy PD2007_036 and Hand Hygiene Policy PD2010_058.

MANDATORY REQUIREMENTS

NSW Health is committed to ensuring health and safety for patients in the oral health care setting and providing a healthy working environment for all oral health employees. This includes adopting and maintaining infection prevention processes that minimise the risk of oral health patients and oral health providers acquiring a health-care associated or occupational infection. For this to be achieved NSW Local Health Districts must implement the 'Oral Health: cleaning, disinfecting and sterilizing standard operating procedures', and:

- successfully promote and implement the Oral Health cleaning, disinfecting and sterilizing procedures through annual auditing processes;
- implement facility wide auditing of oral health practices, which is reported to the Local Health District Chief Executives; and
- set the example: Chief Executives, Health Service Executives, Directors of Clinical Governance, Oral Health Managers and Oral Health Clinical Directors implement and sustain infection prevention practices in all patient care activities.

All health care services and health care workers have a common law duty of care to take all reasonable steps to safeguard patients, staff and the general public from infection. The *Work Health and Safety Act 2011*[17] (WH&S) prescribe the employer's duty of care to provide a safe and healthy working environment for all employees and other persons on their premises.

The *WH&S Act* also prescribes responsibilities for managers (who manage WH&S within the areas they are responsible for) and employees (who must cooperate with the employer and not put anyone at risk by their acts or omissions). There is also a requirement for employers to provide the information, instruction, training and supervision necessary to ensure the health and safety of employees at work.

IMPLEMENTATION

The policy directive and standard operating procedures are to be used in the public dental services, as well as providing guidance to private oral health facilities, such as universities, TAFE and private practices. To implement the policy effectively the following roles and responsibilities are required.

Roles and Responsibilities

NSW Ministry of Health

- Ensure the mandatory requirements and standards of this policy are monitored and acted on accordingly.

Chief Executives of Local Health District

- Assign responsibility and personnel to implement the cleaning, disinfecting and sterilization processes identified in Oral Health: cleaning, disinfecting and sterilizing standard operating procedures.

[17] http://www.comcare.gov.au/laws__and__regulations/ohs_act,_regulations__and__code

Oral Health Clinical Directors and Oral Health Managers

- Provide oral health clinicians, patients and visitors with the means to perform infection control processes;
- Provide support to oral health line managers to implement and sustain infection control processes in oral health settings; and
- Manage oral health staff/s who doesn't comply with the policy, in accordance with NSW Health policy directives for staff performance management.

1. BACKGROUND

The Oral Health: cleaning, disinfection and sterilizing standard operating procedures' document has been developed in accordance with the NSW Health Infection Control Policy[18]; Acts and Regulations that define the registration requirements for Dentists, Dental Therapists, Dental Hygienists, Oral Health Therapists, Dental Prosthetists and Dental Technicians[19][20]; available scientific evidence; and consultations with key stakeholders.

The standard operating procedures (SOP) was developed by the Centre for Oral Health Strategy NSW and State Oral Health Executive through a working group consisting of representatives from Department of Health, Local Health Districts and Infection Control Experts. The SOP was reviewed by the NSW Health Healthcare Associated Infections (HAI) Expert Advisory Group and the Clinical Excellence Commission for accuracy.

In this standard the term:
Must – indicates a mandatory action required that must be complied with.
Should – indicates a recommendation action that should be followed unless there are sound reasons for taking a different course of action.

The SOP is to be read in conjunction with the following NSW Health policies and programs:

- Environmental Cleaning[21]
- Hand Hygiene[22]
- Hand Hygiene In Out Patient Care[23]
- HIV, Hepatitis B and Hepatitis C – Management of Health Care Workers Potentially Exposed[24]
- HIV, Hepatitis B or Hepatitis C – Health Care Workers Infected[25]
- Incident Management[26]
- Infection Control Management of Reportable Incidents[27]
- Infection Control Policy[28]
- Infection Control Policy: Animals as Patients in Health Organisations[29]
- Infection Control Policy: Prevention & Management of Multi-Resistant Organisms (MRO)[30]
- Infection Control Program Quality Monitoring[31]

- Waste Management Guidelines for Health Care Facilities[35]
- Work Health and Safety: Better Practice Procedures[36]

2. GOAL

The goal of this standard operating procedure document is to identify processes that aim to provide a safe clinical environment that protects the health and wellbeing of all patients who access public dental services and all dental staff.

3. KEY DEFINITIONS

Anti-reflux valve	is a valve that only allows liquid to flow one direction. Previously known as Anti-retraction value.
Cleaning	is the physical removal of soil and organic matter from surfaces and other objects using a detergent and water. Cleaning reduces the numbers of microbes on surfaces and prevents multiplication with the production of many organisms by removing organic matter. A clean dry surface is generally hostile to the reproduction of microorganisms.[37]
Clinical Area	is an area that is made of one or more collocated dental surgeries.
Clinical Waste	is waste which has the potential to cause sharps injury, infection or offence. When packaged and disposed of appropriately there is virtually no public health significance. Clinical waste contains the following types of waste: • sharps; • human tissue (excluding hair, teeth and nails); • bulk body fluids and blood; • visibly blood stained body fluids and visibly blood stained disposable material • and equipment; • laboratory specimens and cultures; • animal tissues, carcasses or other waste arising from laboratory investigation or for medical or veterinary research[38].
Decontamination	is a process that renders equipment, or environmental surfaces safe to handle by cleaning and disinfection or sterilization (PD2007_036).
Disinfection	means the destruction of pathogenic and other kinds of micro-organisms by thermal or chemical means. Disinfection is less lethal than sterilization, because it destroys the majority of recognised pathogenic micro-organisms, but not necessarily all microbial forms (eg bacterial spores). Disinfection does not ensure the degree of safety associated with sterilization processes. (PD2007_036 page iv).

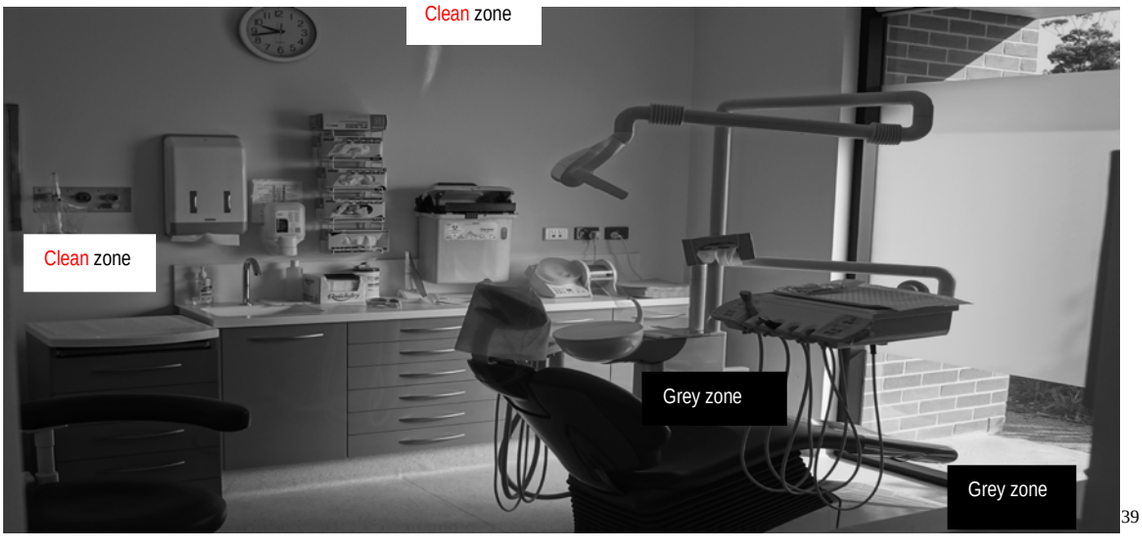
[37] http://www.health.nsw.gov.au/policies/pd/2012/PD2012_061.html
[38] http://www.health.nsw.gov.au/policies/PD/2005/PD2005_132.html

Four-handed dentistry	is the cooperative action of the treating clinician and assistant to significantly enhance overall productivity, efficiency and effectiveness.
NSW Health Services	consists of staff employed in all Local Health Districts, all statutory health corporations, the Ambulance Service of NSW, Institute of Medical Education and Training, Health Technology, Health Support and any declared affiliated health organisations.
Operating Area	is the area set aside as the primary working area includes patient's mouth, bracket table and dental assistant's kit.
Patient	includes (but is not limited to) a person who is accessing medical or health services or who is undergoing any medical or health procedure.
Sharp	is any object capable of inflicting a penetrating injury, which may or may not be contaminated with blood and/or body substances. This includes needles and any other sharp objects or instruments designed to perform penetrating procedures (PD2007_036 page v).
Sterile	is free from all living micro-organisms, usually described as a probability (eg the probability of a surviving microorganism being 1 in 1 million) (PD2007_036 page v).
Sterilization	is the destruction of all living organisms, including spores (PD2007_036 page v)
Surgery Zones	are developed to keep the surgery as clean as possible during the course of treating patients. The zones are clean, grey and dirty.
Technical Procedures	are those procedures carried out by dental technicians within the dental laboratory.

4. DENTAL AND CLINICAL PRACTICE

4.1 Surgery Zones

The surgery zones are designated as clean, grey and dirty and are to be identified in the clinical area (refer to picture below). Clean zones are where no contaminated items enter. The grey zone is centred on the patient's mouth and includes the clinician and assistant work surfaces. Dirty zones are where contaminated instruments are placed to start the cleaning and/or disinfection and/or sterilizing process. Dirty zones are not in the surgery.



[39]

[39] Nepean Blue Mountains dental clinic Penrith taken by J Conquest

4.2 Placement of equipment

Equipment should be positioned as follows:

- primary work surface (grey zone), usually on top of the assistant's cart and on the bracket table, where instruments and equipment of direct relevance to the appointment should be placed;
- when using equipment that cannot be sterilized such as amalgamators and curing lights, barrier film/s and/or disinfection must be carried out as per manufacturer's instructions after each patient;
- all other items that are not involved in the procedure such as the clinical record, patient notes, radiographs, computer key board and mouse must remain in the clean zone. To access these items in the clean zone gloves must be removed and hand hygiene performed;
- if other items, equipment or consumables are required during the procedure they should be retrieved by the assistant by:
  - using transfer forceps that are cleaned and disinfected between patients, or single use only, and stored in the clean zone; or
  - removing gloves and performing hand hygiene before and after retrieving equipment.

Exemptions may occur depending on the design of the dental unit as some equipment may be attached to the unit, such as the curing light and would therefore remain in the grey zone. This equipment must be covered with a barrier film to minimize bacterial/microbial load. Decontamination of this equipment must be carried out as per the manufacturer's instructions.

4.3 Dental practice processes

Clinicians and assistants should be trained in four handed dentistry techniques to improve safety and performance as it is considered to be the ideal way to deliver of care[40] [41].

4.3.1 Pre-plan, pre-set, pre-dispense, reprocessing, dispense

All instruments should be set up and materials dispensed prior to treatment commencing and remain in their sterile pack until the patient is seated in the dental chair. This reduces the need to enter drawers or cupboards during an appointment.

Adherence to the following guidelines is recommended:

- all materials should be pre-dispensed, where appropriate. (Some volatile materials deteriorate quickly in air, so should be prepared for dispensing, but not dispensed.);
- hand hygiene must be performed immediately prior to the procedure commencing and after finishing (refer to 5 moments for hand hygiene[42]), and appropriate personal protective equipment shall be used. Please refer to NSW Health Hand Hygiene[43] and Infection Control Policy – Standard & Additional Precautions for personal protective equipment (PPE) requirements;
- materials that require hand mixing should be mixed on a single sheet of non-porous clean paper; and
- a bib, tray or paper towel should be used to define the work surface. Pre-set/pre-dispensed items should be placed on the primary work surface.

[42] http://www.hha.org.au/home.aspx
[43] http://www.health.nsw.gov.au/policies/pd/2010/PD2010_058.html

4.4 Methods of Limiting Contamination

4.4.1 Dental dam

The use of dental dam is an effective measure in confining and limiting contamination.

Silicone dams must be used for patients who have a known sensitivity or allergy to latex.

4.4.2 Suctioning

Effective suctioning at the tooth site will markedly reduce contamination from aerosol. This is achieved by:

- using a four-handed technique with a trained dental assistant;
- utilising high speed evacuation suction tips that have a posterior and anterior end. Suction tips must not be reversed during a procedure. If the other end of the tip is required, a new tip must be used; and
- disposable single use low speed suction tips may be pre-bent to increase effectiveness.

Cleaning of suction is guided by the manufacturer's 'Instructions for Use'. Detergents and disinfectants must be registered with the Therapeutic Goods Administration (TGA) and listed on NSW State Contract.

5. DENTAL CLINIC EQUIPMENT

5.1 Chair controls

The chair should be pre-set at the commencement of treatment. Where possible the chair should be foot controlled allowing adjustment at any time, however if the chair is hand controlled then barrier film must be used.

The entire chair including the controls located on the back of the head rest or the side of the chair must be wiped clean with neutral detergent and water and/or detergent wipes at the conclusion of the appointment. Single use barrier film may be used in addition to this procedure, but must not be used instead of this procedure.

5.2 Lights

The patient light should be pre-set at the commencement of treatment. Only the handles of the overhead light should be touched, and these must be covered with barrier film where light sensor controls are not in place. The barrier film must be changed between patients. The light and handles must then be wiped clean with neutral detergent and water at the conclusion of the appointment and between patients (NSW Health Infection Control Policy).

5.3 Mouth rinsing

Spittoons must not be used. If mouth rinsing is required the mouth can be rinsed with a triplex and high-speed suction or a funnel connected to the high speed suction. Funnel attachments must be sterilized between patients or single use only. Following impressions, a two-cup technique may be used by patients to rinse their mouth. The used cups are to be disposed of into general waste whilst their contents can be discarded into a designated dirty sink in a utility/disposal room or by suction.

5.4 Hand Hygiene - Clinical Sinks[44]

'Hand washing should be undertaken in dedicated (clean) sinks preferably fitted with non-touch taps (or done with a non-touch technique) and not in the (contaminated) sinks used for instrument cleaning. If touch taps are used the taps may be turned on and off with a paper towel' (ADA 2008a).

Hands must not be washed in a sink which is used for processes such as:

- instrument cleaning
- disposal of blood, body substances or chemicals
- cleaning of impressions and impression bowls
- flushing of lines
- where bleach or other antiseptic solutions are disposed

5.5 Air, water and suction lines

Air, water and suction lines[45],[46] must be flushed for a minimum of **2 minutes** at the start of the day and for **30 seconds** after each patient.[47]

5.5.1 Air

Triplex heads must be wiped clean with neutral detergent and water and covered with a barrier film after each use.

Triplex tips must be changed after each patient use and sterilized or if disposable these need to be discarded after each use.

5.5.2 Suction

Suction lines should be non-convoluted with a flat bore and not covered with woven fabric. Suction lines should be flushed thoroughly with water after each patient and at the end of the day using neutral detergent or following manufacture's 'Instructions for Use'.

5.5.3 Water

All dental equipment which supplies water to the oral cavity is to be fitted with anti-reflux valves. Routine maintenance of anti-reflux valves is necessary to ensure their effectiveness. Manufacturer's 'Instructions for Use' must be considered to establish an appropriate maintenance routine.

Australian Dental Association Inc. state that 'sterile irrigants such as sterile water or sterile saline as a coolant are required for surgical procedures such as dentoalveolar dental implant placement'.

Water for tooth irrigation during cavity preparation and for ultrasonic scaling should be of no less than potable standards as identified in the Australian Drinking Water Guidelines 2011.[48] When treating immunocompromised patients, it is recommended that water from dental unit waterlines contain less than 200 colony forming units per mL. Bacterial levels can be tested using commercially available test strips or through commercial microbiology laboratories.[49]

5.6 Transportation of Instruments

Where dental care is provided in a location separate to the sterilization, all sterilized instruments and equipment must be transported in metal or rigid plastic (puncture proof) containers with secure lids to prevent damage and/or spillage. There are to be separate dedicated containers for sterile and contaminated instruments/equipment that are clearly labelled and in a different colour to identify its contents.

The labels must be worded 'clean' or 'dirty'. These containers should be cleaned with neutral detergent and water and are to be dedicated for this purpose only. All transport equipment shall be maintained in a clean, dry state, and in good working condition.

Public Dental Services must provide all staff with personal protective equipment to undertake this task.

The motor vehicles used to transport equipment should have adequate means of segregation between 'clean' and 'dirty' instruments.

6. DENTAL PROSTHETICS/LABORATORY

6.1 Clinical Area[50]

6.1.1 Mixing of impressions

For mixing of impressions, a flexible bowl and spatula are used. The flexible bowl and spatula must be cleaned with neutral detergent and water and dried after use.

6.1.2 Cleaning of Impressions/Prosthesis[51]

When taking an impression either single use trays or sterilized metal trays must be used. All impressions must be rinsed clean with neutral detergent and running water to remove all debris. A neutral detergent must be used according to the manufacturer's instructions for the cleaning of impressions and dental prostheses. This process must occur prior to transportation from the clinical area. If a designated sink is not available in the clinical area an alternative location must be provided.

Public Dental Services must consider the DOHA guideline statement; *'Although the efficacy of disinfection of dental materials is still undetermined, standard precautions must be applied whenever people handle dental material. The most important step is the thorough cleaning of material that has contacted oral tissue (e.g. impressions). Thorough rinsing with tepid running water, followed by the application of a neutral detergent and further rinsing, should continue until all visible contamination is removed'*[52].

6.1.3 Transportation of Dental Prosthesis Impressions

Transportation to the laboratory of any items is to be placed in a designated container with a lid or single use sealable plastic bag. Such containers and lids or bags must be single use or cleaned and decontaminated before and after use. The container/s or bag/s must be marked identifying the disinfecting procedure for the impression or dental prostheses that has been undertaken.

[51] http://www.health.gov.au/internet/main/publishing.nsf/content/icg-guidelines-index.htm
[52] http://www.health.gov.au/internet/main/publishing.nsf/content/icg-guidelines-index.htm

6.1.4 Polishing

For all items and appliances it is recommended that:

- fresh pumice must be used to polish each patient's dental prostheses and must be discarded after use;
- the pumice tray must be cleaned after each use;[53]
- denture polishing brushes and denture mops should be cleaned as per the manufacturer's 'Instructions for Use', and
- detergents and disinfectants must be registered with the Therapeutic Goods Administration (TGA) and listed on NSW State Contract.

6.1.5 Minor Adjustments

Where possible, denture adjustments are to be done in the laboratory. Dentures and dental prostheses are to be cleaned with a neutral detergent and water before extra oral adjustments.[54] Minor adjustments may be performed at the chair side in the surgery over a bin. Reusable burs used for adjustments must be cleaned and sterilised after use in accordance with manufacture's 'Instructions for Use'. Single use burs must be discarded at the chair-side in the sharps container.

6.1.6 Return to the Clinic[55]

Dental prostheses and appliances must be cleaned with neutral detergent and water before leaving the laboratory for patient areas.

Items must be transferred in sealed containers or in single use sealable plastic bags with appropriate identification. If disposable containers are not used and reusable containers are used, they must be cleaned between uses.

6.2 Radiographs

Between patients the head of the x-ray tube must be wiped down with neutral detergent and water after each use. Single use barriers must be used on parts that come into contact with non-intact skin or mucous membrane. All parts including lead aprons must be thoroughly cleaned with neutral detergent and water after each use and stored dry.[56]

Radiographic films should be covered by single use barrier envelopes or be single use films, which are wiped over with neutral detergent prior to processing.[57]

6.3 Extra-Oral Radiological Equipment

Single use barrier film must be used for extra-oral radiological equipment,[58] such as bite piece for OPG, chin rests, head frames, cephalostat earpieces and extra-oral cassettes and are to be thoroughly cleaned with neutral detergent and water after each use.

6.4 Use of Covers or Sheaths on Radiological Equipment

Single use barrier film designed to protect the equipment must be disposed of between patients. Barrier film use does not negate the need to clean the equipment after each patient.[59] Manufacture's 'Instructions for Use' must be followed.

GROWTH ASSESSMENT AND DIETARY ADVICE IN PUBLIC ORAL HEALTH SERVICES (GL2019_001)

PURPOSE

This document introduces routine measurement of height and weight of patients in public oral health services, as part of addressing the NSW Premier's priority on Tackling Childhood Obesity to reduce childhood overweight and obesity by 5% by 2025.

This document complements the NSW Health Guideline *Growth Assessment in Children and Weight Status Assessment in Adults* (GL2017_021). It provides specific directions on the implementation of growth assessment and dietary advice for children in public oral health services.

KEY PRINCIPLES

A strategic direction under the NSW Premier's priority on Tackling Childhood Obesity is the routine collection of height and weight across NSW Health Services. Routine weight status assessment and management by public oral health services, including the provision of brief advice and referral pathways to healthy lifestyle programs, is important for inter-professional collaboration to address the issue of childhood obesity.

This Guideline provides the recommended approach for public oral health services to implement routine growth assessment and advice into clinical care. This includes:

- Professional development for staff (Section 2);
- Processes for growth and dietary assessments (Section 3);
- Provision of brief intervention for children above a healthy weight (Section 4.1);
- Provision of dietary and physical activity advice to address both oral health and obesity risk (Section 4.2), and;
- Referral pathways and processes for children identified as being outside of a healthy weight status (Section 5).

Successful implementation of this Guideline will require oral health service to establish partnerships with other key health services in their Local Health District, such as Health Promotion, to obtain additional support for staff and patients.

USE OF THE GUIDELINE

Public oral health staff should be aware of the recommended professional development (Section 2), and the processes for:

- Measuring and recording height and weight of patients (Section 3);
- Providing an appropriate brief intervention (Section 4); and
- Providing referrals to other health services (Section 5).

Public oral health service managers and clinical directors should support staff in completing recommended professional development, and in the implementation of the measurement of height and weight, brief interventions, and referrals as part of standard clinical practice.

The Growth Assessment and Dietary Advice in Public Oral Health Services guideline can be downloaded from: https://www1.health.nsw.gov.au/pds/Pages/doc.aspx?dn=GL2019_001

TELEDENTISTRY (GL2020_019)

GUIDELINE SUMMARY

This Guideline provides a framework for the use of teledentistry-enabled models of care by NSW Health Districts. Specifically, this Guideline is designed to provide information for live patient – provider teledentistry interactions and store-and-forward episodes and to establish standard item codes for teledentistry services.

KEY PRINCIPLES

- Provide a framework for teledentistry utilisation in NSW public dental services for:
  - Live patient and provider teledentistry services
  - Store and forward teledentistry services
- Establish standard item codes for teledentistry services
- Establish a consistent approach to recording and reporting of teledentistry episodes

USE OF THE GUIDELINE

This Guideline is intended for use by NSW Health public dental and medical organisations which provide teledentistry services.

- Support public dental services to use teledentistry to improve access to oral healthcare
- Clinicians should follow these guidelines when providing teledentistry-enabled services
- Standardise the use of item codes for recording teledentistry utilisation
- Dental clinicians should use the described, standard teledentistry item codes when providing treatment
- Teledentistry services should be monitored, evaluated and improved

The Teledentistry guideline can be downloaded from:
https://www1.health.nsw.gov.au/pds/Pages/doc.aspx?dn=GL2020_019

EMERGENCY DEPARTMENT PATIENTS AWAITING CARE (PD2018_010)

PD2018_010 rescinds PD2010_075.

PURPOSE

The purpose of this Policy is to outline the mandatory requirements and procedures for emergency department (ED) staff for patients, their families and carers immediately following the triage process and while awaiting the commencement of clinical care and medical assessment in the ED.

Although this Policy seeks to provide guidance on the clinical safety and care of patients while they are waiting; of equal importance is the outcome of patient satisfaction related to the waiting environment. Factors identified by patients, families and carers related to poorer waiting experience include lack of communication in general whilst waiting, uncertainty about waiting times and lack of information about the functions of the ED. Communication and early symptom management have been identified as key measures to prevent patients from leaving without being seen following triage1; which is an important monitoring measure of quality in the ED environment. Medical, nursing, clerical, allied health and other ED support staff all have a role in ensuring clear communication for patients and their families.

This Policy does not seek to outline the triage process – please refer to NSW Health policy PD2013_047 Triage of Patients in NSW Emergency Departments for information on triage in NSW.

MANDATORY REQUIREMENTS

All NSW Public Health Organisations must ensure that local processes are in place which comply with this Policy and support the mandatory requirements detailed here:

- This Policy applies to all adult and paediatric patients, following triage in the ED waiting for clinical care to commence and/or medical assessment, regardless of their location.
- In addition to the parameters of this Policy; people brought to the ED involuntarily for the purpose of initial health assessment, care and treatment, will be cared for in accordance with the relevant legislative framework for example The Mental Health Act 2007 (NSW) or the Crimes (Administration of Sentences) Act 1999.
- Undifferentiated patients can be at risk of deterioration – for those located in the waiting room, lack of supervision adds to this risk. Ensuring the safety of patients in the waiting room is the responsibility of the senior medical and nursing staff in charge of the shift.
- The ED waiting room should be a pleasant, safe environment where patients, families and carers can be comfortable. When designing or redesigning ED waiting rooms, emphasis should be on ensuring that adequate signage, a culturally appropriate setting and access to toilets and refreshments are accommodated.
- Regular communication with waiting patients is essential, particularly in relation to ED processes and waiting times. Communication should be via a range of methods that accounts for the patient and family/carer's understanding of information and any cultural, language, social or disability requirements that are identified.
- Patients waiting for clinical care to commence and those accompanying them may become frustrated, particularly in the absence of regular communication. Local practices that focus on taking action to recognise and respond to escalating behaviour are safer, for both patients and staff, than those that rely solely on managing behaviour that has already become aggressive or violent.
- NSW Health has a zero tolerance policy[2] to violence and aggression where, as far as reasonably practicable, action will be taken to prevent and mitigate aggressive behaviour and violence. Appropriate action will be taken to protect staff, patients and visitors from the effects of such behaviour, while ensuring clinical services continue to be provided.

[1] Ibanez, G. Guerin L. Simon N. Which improvements could prevent the departure of left-without-being-seen patients? *Emerg Med J 2011, 28: 945-947*

[2] NSW Health Policy 2015 Preventing and Managing Violence in the NSW Health Workplace - A Zero Tolerance Approach (available at http://www1.health.nsw.gov.au/PDS/pages/doc.aspx?dn=PD2015_001)

- Clinical care of waiting patients may commence according to locally endorsed and statewide clinical pathways whilst the patient is in the waiting room or other area of ED awaiting medical assessment. Regular reassessment of the patient's clinical condition should occur, particularly if the waiting time exceeds the allotted triage category maximum waiting time. Documentation of all assessments and clinical care commenced must be entered into the patient's health care record.
- During triage and any interaction with ED staff, patients and families/carers should be encouraged to speak up if they feel their condition is deteriorating whilst waiting for examination, this is especially true in departments where constant patient observation is not possible in the waiting room. Where a patient's deterioration in condition has been detected by ED staff, established local clinical emergency response system processes should be followed.
- ED clinicians retain responsibility for the overall clinical management of patients transported to ED via Ambulance; this occurs as soon as the patient enters the ED. In recognition of occasions of Transfer of Care delays between Ambulance and ED staff, this Policy outlines a shared care responsibility for the care of patients.
- Local processes should be in place to monitor numbers of patients who 'Did not Wait' for treatment following triage, including rates for Aboriginal and non-Aboriginal patients. Strategies to address issues identified should be implemented and evaluated.

IMPLEMENTATION

Local Health District Chief Executives are responsible for:

i. Assigning responsibility, personnel and resources to implement this policy.
ii. Establishing mechanisms to ensure that the Mandatory Requirements are applied, achieved and sustained as usual processes for patients awaiting care. This should include nomination of an executive sponsor to support staff responsible for implementation of this policy.
iii. Ensuring that any local policy reflects the requirements of this policy and is written in consultation with hospital executive, Clinical Governance Unit, ED senior management, and clinical staff.

Emergency Department Patients Awaiting Care Procedures

1. BACKGROUND

1.1 About this document

This Procedure document supports and further explains the mandatory requirements of the Emergency Department Patients Awaiting Care policy statement through the following components:

- The waiting room environment; including safety.
- Procedure for managing waiting patients; including communication, assessment and escalation of care.
- Guidance on patients who arrive with other services staff such as NSW Police, NSW Ambulance and custodial officers.
- Patients who decide not to wait for treatment.

This procedure applies to all patients, following triage in the emergency department (ED) awaiting clinical care to commence and/or medical assessment, regardless of their location.

Key definitions

Key Definitions are only included in this section where there may be multiple uses for terminology used and so detailed here to provide clarification on the use in this document.

Absconding Patient	For the purposes of this document, an absconding patient refers to an involuntary patient detained under the Mental Health Act 2007 or the Mental Health Forensic Provisions Act, who leaves an Emergency Department, without permission, or a voluntary patient who leaves an Emergency Department who is considered at risk.
Did Not Wait	Refers to a patient who decides not to wait for clinical care to commence or medical assessment following triage in the emergency department
Medical assessment	For the purposes of this document, medical assessment also indicates assessment by a Nurse Practitioner
Transfer of Care	Transfer of Care is defined as the transfer of accountability and responsibility for a patient from an ambulance paramedic to an emergency department clinician. Transfer of Care is deemed complete when clinical handover has occurred, the patient has been offloaded from the ambulance stretcher and the care of the paramedics is no longer required.

2. THE WAITING ROOM ENVIRONMENT

2.1 Waiting room design

Waiting rooms are areas specifically for patients, families and carers before and after clinical care. Waiting rooms that are not comfortable have been demonstrated to play a key role in patients leaving the ED before treatment[3]. In light of this, specific attention should be given to the design of the waiting room including making modifications and improvements. Waiting areas should not be cluttered with posters and unnecessary signs as this creates confusion for those visiting the ED.

The waiting room should be well lit with access to natural light if possible.

If able to be accommodated; EDs and waiting rooms should be designed with unobstructed views of the entrances and exits. An open plan design allows staff to visually monitor the movements within and outside the waiting room as well as changes in patients' conditions. Similarly waiting room and triage staff should be visible to patients and relatives in the waiting room, which then allows patients to interact with staff when they have concerns and updates. An open visual environment allows staff to quickly assess the waiting area at any given time. Reception and triage areas should have convex mirrors or CCTV in place to ensure reception and triage staff can see all parts of the waiting room.

The use of different coloured seating or different areas of seating as a visual cue indicating where the patient is in the triage process may be used. Chairs should be comfortable, easy to clean and robust. Consideration should be given to multimedia activities that can provide some distraction in the waiting room including the use of televisions and videos. Consideration should also be given to provision of a mobile device charging station.

For further guidance on waiting room design and NSW requirements please see Chapter 15 of Protecting People and Property: NSW Health Policy and Standards for Security Risk Management in NSW Health Agencies. Additionally, information is available in the Australasian Health Facility Guidelines – Emergency Unit document.

[3] Ibanez, G. Guerin L. Simon N. Which improvements could prevent the departure of left-without-being-seen patients? Emerg Med J 2011, 28: 945-947

2.1.1 Wayfinding

Clearly visible wayfinding solutions directing patients, families and carers to the various areas within the ED must be used. Wayfinding plays a major role in the coordination of safety, process and patient flow in the ED[4].

Wayfinding solutions should be in culturally specific languages of the cultural groups that predominately access the hospital's services. It should include the use of universal pictorial symbols and also consider the use of braille symbols.

2.1.2 Access to toilets and refreshments

EDs should make provision for adequate access to toilets and refreshments within or in close proximity to the ED. Facilities for people with a disability, parents with babies and young children should also be factored into the design and location of the toilets and refreshments. Larger EDs should consider access to cafes and vending machines thereby providing 24 hour access to refreshments. Smaller EDs may have access to vending machines or other means of providing refreshments.

The NSW Health Framework 'Healthy food and drink in NSW Health facilities for staff and visitors' provides best practice guidelines to increase the availability of healthy options to make the healthy choice an easy choice for our staff and visitors. It provides guidance on appropriate options in vending machines (e.g. no sugary drinks and including everyday snacks such as dried fruit or lightly salted nuts).

The positioning of both toilets and refreshments is important and the design should not impede the flow and movement within the waiting room.

2.1.3 Considerations for Aboriginal patients

Section 4.1 acknowledges the higher rates of Aboriginal patients who choose not to wait for treatment in ED when compared to non-Aboriginal patients. An important contributor to this issue is Aboriginal patients feeling safe to stay and wait. The use of local Aboriginal art in ED waiting rooms can provide links to culture and community; advice should be sought on appropriate art from the local Aboriginal community. If available in the hospital, relatives may access the designated Aboriginal waiting room for families and carers. If no room exists, a culturally appropriate space within the local hospital should be identified.

Patients identifying[5] as Aboriginal people should be provided with information regarding access to Aboriginal Health Workers that may be available. Access to any of these services may include referral pathways for patients that present out of business hours.

2.1.4 Cultural and age appropriate considerations

EDs should seek to cater for all community specific needs; this will be based on the demographic of the local population and will include information in languages other than English that relate to the local community's needs.

Ideally there should be a dedicated waiting area for children that is easily observable by staff, and where possible with age appropriate play equipment. Where there is not a separate waiting area, there should be processes in place that, where possible, children can be fast tracked out of the waiting room area. Art that specifically caters to the engagement of children should be considered.

[5] NSW Health policy PD2012_042 Aboriginal and Torres Strait Islander Origin - Recording of Information of Patients and Clients (available at http://www1.health.nsw.gov.au/pds/ActivePDSDocuments/PD2012_042.pdf)

2.2 Waiting room personal safety

2.2.1 Organisational safety factors

Procedures to identify and manage risks in the clinical environment must be developed and implemented, in consultation with staff and other duty holders. For more information see NSW Health Protecting People and Property - Policy and Standards for Security Risk Management in NSW Health Agencies.

The occurrence of an incident of aggressive behaviour is to be reported and reviewed with the required timeline in accordance with the PD2014_004 Incident Management Policy and local management procedures.

2.2.2 Environmental safety factors

Factors for consideration when assessing potential risks in ED waiting rooms include:

- Areas of first contact should be designed to prevent unauthorised entry and provide security and protection for staff members, patients and visitors while still allowing good communication.
- Main public entry access doors must be able to be secured and fitted with Closed Circuit Television (CCTV) cameras and intercom systems for after-hours access and be able to be secured remotely.
- Procedures and physical design/layout must reflect the specific risks identified for that ED environment, ensuring effective and safe access and egress from the ED.
- Consideration should be given to any objects or furniture that may be used to cause injury. Objects like this should be fixed appropriately e.g. television screens and brochure stands.
- Consideration should be given to the installation of physical barriers to aggression such as security screens for triage and clerical staff and must be appropriate to the environment, i.e. provide protection for staff but not reduce the ability for patients or their carers to clearly communicate with staff.
- Triage, reception, and interview rooms must include duress alarms, fixed and/or mobile alarms as appropriate. All staff working in EDs must have and wear a mobile duress alarm.
- Triage, reception and interview rooms must have two doors to allow for appropriate access and exit and where possible have doors that swing outwards.
- Access to clinical areas from the waiting room must be controlled, e.g. doors are secured by swipe card access, with entry by permission of clinicians.

When patients presenting to an ED are considered to be at risk, or who have a particular security need, a risk assessment to identify and address the identified security risks must be undertaken. These patients may include (but are not limited to):

- victims of sexual assault[6]
- victims of domestic violence[7]
- patients affected by the use of drugs or alcohol
- patients with mental illness or mental disorder
- patients in custody
- patients who are confused or cognitively impaired
- patients with developmental disability
- children at risk of harm[8]. 298(16/03/18)

[6] NSW Health Policy PD 2005_607 Sexual Assault Services Policy and Procedure Manual (Adults) (available at http://www1.health.nsw.gov.au/pds/ActivePDSDocuments/PD2005_607.pdf)

[7] NSW Health Policy PD2006_084 - Identifying and Responding to Domestic Violence, Section 12.1 Emergency Departments (available at http://www1.health.nsw.gov.au/pds/ActivePDSDocuments/PD2006_084.pdf)

2.2.3 Response to escalation

Where patients, or their carers/guardians, present a known risk to the health and safety of staff or others, a patient alert (or file flag) should be added to the health care record. Where a patient alert is added there must be an up to date management plan documented in the health care record to ensure those staff managing the presenting individual can do so in a safe and appropriate manner. Information on current individuals with patient alerts must be highlighted during clinical handover.

Staff should use de-escalation techniques to prevent and address escalating behaviour. Where de-escalation is not successful or a staff member continues to feel unsafe, the following actions should occur:

- Use of personal space and environmental awareness to keep safe.
- Calling for back up from colleagues, including from more senior staff.
- Activating duress alarms to alert the duress (code black) response.
- Scanning the environment for dangerous items.
- Identifying exits.
- Activating the process for calling the police where a matter involves a weapon or continues to escalate.

Where a duress alarm is activated summoning the organised response, the duress response team must be multi-disciplinary and led by clinicians with assistance by security staff if necessary. Security staff should act under the direction of the lead clinician and undertake actions consistent with the scope of their role.

2.2.4 Education and Training

Staff working in or moving through ED waiting rooms must maintain awareness of personal safety at all times. All staff are responsible for engendering a workplace health and safety culture. Staff working within the ED setting are to be provided with training, consistent with the standards set out in PD2017_043 Violence Prevention and Management Training Framework for NSW Health Organisations, to ensure they are equipped to de-escalate or manage violent/aggressive behaviour. This training must include team based training.

3 CARING FOR WAITING PATIENTS

3.1 Customer Service Approach for frontline ED staff

Frontline ED staff includes reception, triage, nursing, medical, porters and allied health staff who interact with patients at all stages of their journey. These staff are often the first contact patients and their families/carers will have with the health system and hospital; a specific focus on patient experience, customer service and welcoming, caring communication is an important part of their role.

Education resources such as online learning, videos and locally delivered resources which allow for simulation training should be provided (at state and local level) and will support the maintenance of a high standard of interaction with all patients by staff.

Utilising a customer service approach in ED reception areas will also assist in minimising common issues in ED such as patients who “Did Not Wait” for treatment, escalating behaviour and patient dissatisfaction with their ED experience. Review of these types of incidents in NSW EDs is often traced back to unclear or perceived uncaring interactions with staff at the beginning of the patient’s journey.

Local investment in real time opportunities for patients, families and carers to provide feedback on their ED experience should be considered. 298(16/03/18)

[8] NSW Health Policy PD2013_007_Child Wellbeing and Child Protection Policies and Procedures for NSW Health (available at http://www1.health.nsw.gov.au/pds/ActivePDSDocuments/PD2013_007.pdf

3.2 Communication with waiting patients and families/carers

Patients and families/carers should have access to information outlining the ED process, including information brochures and/or audio visual information. Communication should be via a range of methods that accounts for the patient and family/carer's understanding of information and any cultural, language, social or disability requirements that are identified[9].

Patients from culturally and linguistically diverse backgrounds and patients with a disability should be provided with specific information regarding their ED stay including access to Social Workers and interpreters.

Patients and families/carers should be provided with regular, ongoing communication regarding changes to waiting times and their management. In many cultures, family members have a specific role or responsibility to carry out on behalf of the family member in the ED and these needs should be understood and accommodated where possible by ED staff. Patients may be informed of alternatives to ED care for their condition for example, general practitioner and medical centres if clinically appropriate.

Patients must be encouraged to speak with the triage/waiting room nurse prior to leaving the ED prior to medical assessment.

All communication should be documented in the patients' health care record.

3.3 Assessment of waiting patients following triage

Clinical care may commence whilst the patient is in the waiting room. Patients may be identified by the triage nurse as appropriate for initiation of care according to locally endorsed and statewide clinical pathways.

Regular reassessment of patients should occur, particularly if they wait longer than the allotted triage category time. This may include regular visual observation and haemodynamic observations where appropriate.

Documentation of the initiation of care and patient assessment must be completed in the patient health care record.

ED processes should facilitate early contact with senior medical and nursing decision makers to ensure that relevant tests are ordered and treatment commenced as soon as possible after arrival.

The waiting room nurse or Clinical Initiatives Nurse (CIN) (where these roles exist) should be responsible for the regular reassessment and initiation of care of waiting room patients. The CIN may function under the direction of the triage nurse or according to local policies. Where there is no CIN or waiting room nurse, local processes must be in place to ensure safety of patients in the waiting room.

High risk patients should be positioned in a highly visual area of the waiting room and moved to an appropriate clinical area as soon as possible. This may include patients at risk of harm to themselves/others or at risk of absconding. Vulnerable patients including children or elderly patients or those unable to self advocate in the waiting environment must to be allocated to an area of the ED where appropriate supervision by ED staff is available.

Staff should be trained on how to identify patients at risk of highly contagious infectious diseases and to quickly isolate patients and/or provide masks and other personal protective equipment to prevent the spread of disease.

[9] NSW Health Policy PD2017_001 Responding to Needs of People with Disability During Hospitalisation (available at http://www1.health.nsw.gov.au/pds/ActivePDSDocuments/PD2017_001.pdf)

3.4 Escalation of care for waiting patients

Recognition of a patient's deterioration may occur through patients, families, carers and ED staff who assess the patient following triage.

Deterioration in condition may be recognised through:

- Physiological abnormality including falling or trending 'outside of the flags' on the standard patient observation chart.
- New or progressive clinical symptoms that require more urgent medical review.
- Deterioration in mental state.
- Escalation in behaviour.
- Patient, family or caregiver concern.

Any waiting patient whose condition deteriorates should be managed in accordance with the local clinical emergency response system processes[10] including notification to senior ED clinical staff and documentation in the health care record.

Patients and families/carers should be informed of how to contact a staff member should they feel that the patient's condition is deteriorating whilst waiting for care to commence.

Should a patient or visitor who deteriorates in the waiting room need assistance to a more appropriate location manual handling must be in accordance with Work Health and Safety safe working practices.

3.5 Patients arriving with other services staff

3.5.1 Patients who arrive by ambulance

The ED is responsible for the overall clinical management of any patient transported by ambulance as soon as the patient enters the department[11]. The following principles apply for these patients:

- Local strategies should be in place to support early offload of ambulances.
- Local systems should be implemented to monitor the number of patients in the ambulance bay to assist in quality care delivery, safety and patient flow.
- Clinical care should commence in accordance with locally endorsed or statewide clinical pathways as appropriate.
- Following triage, patients suitable to be transferred into the waiting room are to be offloaded and appropriate clinical handover undertaken.
- Patients remaining on an ambulance stretcher for longer than 30 minutes or who have escalating care requirements are to be managed according to local clinical emergency response system processes.
- If a delay in Transfer of Care of the patient between paramedics and ED clinicians occurs, a shared care responsibility exists for monitoring and communicating changes in the patient's clinical condition, between Ambulance and ED staff. The triage nurse should inform the Paramedic of an appropriate staff member to contact should the patient deteriorate whilst on the stretcher.

---

[10] NSW Health Policy PD2013_049 Recognition and Management of Patients who are Clinically Deteriorating (available http://www1.health.nsw.gov.au/pds/ActivePDSDocuments/PD2013_049.pdf)

[11] ACEM Statement of Responsibility for Care in Emergency Departments (2012) http://www.acem.org.au/getattachment/1e5b1137-43b5-4304-af42-de4c00884d01/Statement-on-Responsibility-for-Care-in-Emergency.aspx

- A joint risk assessment should be undertaken by ED clinical staff and paramedics for patients with mental health issues who have been voluntarily brought to the ED but for whom presenting paramedics have safety concerns.
- All care is to be documented in the patient's health care record.

3.5.2 Patients who arrive with Police

For people presenting in Police custody or detained under the Mental Health Act/ Mental Health Forensic Provisions Act, Police are to provide a comprehensive verbal handover to the triage nurse or assessment clinician. The handover discussion should focus on:

- Facilitating the effective and safe management of the person.
- Maintaining the safety of staff, other patients and visitors.
- Include a risk assessment of the likelihood of the person's behaviour escalating to become a safety issue; particularly once any mechanical restraints are removed and/or police withdraw.

These processes will assist with expediting handover of patients to ED staff from Police at the earliest opportunity.

Presenting police are to clearly communicate with clinical staff whether to notify police prior to the person being discharged from the ED. ED staff are to ensure this information is conveyed to staff as part of safe clinical handover between shifts and upon ward transfers.

People brought to the ED under the Mental Health Act by Police are not to be handed over to NSW Health security staff only. Security staff should act under the direction of the lead clinician and undertake actions consistent with the scope of their role.

3.5.3 Patients who arrive with custodial officers

Patients arriving from custody should be assessed and managed in the same manner as other patients. If a private section of the ED is available, they should wait there with custodial officers. ED staff can contact Justice Health & Forensic Mental Health Network (JH&FMHN) clinicians if required, especially for those custodial patients requiring ongoing nursing care on discharge, as many custodial sites do not have 24 hour nursing care. Patients transferred from an adult correctional or juvenile justice centre will have a letter with them titled 'Information for Hospital Staff: Healthcare for People in Custody' including contact phone numbers.

4 PATIENTS WHO DECIDE NOT TO WAIT FOR TREATMENT

The term "did not wait" (DNW) or equivalent is used to describe patients who leave whilst awaiting clinical care or medical assessment to commence. These patients have been triaged and may or may not have had initial nursing assessments and observations as part of the triage process. DNW patients represent an important subset of the ED patient population in relation to quality of care for both access to and the process of ED care delivery[12].

Signage must be prominently placed in ED waiting areas advising patients to notify the triage staff if they leave the ED whilst awaiting clinical care to commence or medical assessment.

ED clinical staff should discuss the safety implications of leaving without being medically assessed with the patient and family/carers. Communication of safety implications should be in line with guidance in Section 3.1 Communication with waiting patients and families/carers. A senior clinician must be notified of any concerns about patient's safety. Documentation of conversations with the patient, family/carers and senior clinician is to be recorded in the patient's health care record. 298(16/03/18)

[12] EMERGENCY MEDICINE — RESEARCH The Medical Journal of Australia ISSN: 0025-729X 3/17 December 2007 187 11/ 12 626-629 ©The Medical Journal of Australia 2007 www.mja.com.au

Notification to a senior ED clinician and documentation should also be undertaken if the triage nurse is concerned for patients who choose to leave without notifying staff.

Health practitioners should be mindful of their obligations with regard to Section 27 of the Children and Young Persons (Care and Protection) Act 1998, which requires mandatory reporting by health care workers where there are reasonable grounds to suspect a child is at risk of significant harm.

Health practitioners should also be mindful of whether the Mental Health Act provisions may be applied to the patient. Involuntary patients detained under the Mental Health Act who have absconded are able to be apprehended and returned to the ED in accordance with the Act. Notification of incidents should be as per PD2014_004 Incident Management Policy

4.1 Monitoring of rates of patients who 'Did not Wait'

EDs should maintain a local auditing system to monitor trends in rates of DNW. Review of data should also be undertaken by Aboriginal and non-Aboriginal patients as there is significant evidence in the literature of higher rates of DNW among Aboriginal patients presenting to ED[13] [14]. Addressing this issue is in line with the Australian Commission on Safety and Quality in Healthcare's guidance on Improving care for Aboriginal and Torres Strait Islander People.

Locally designed strategies to manage identified reasons for patients who DNW should be implemented with outcomes reviewed. Consideration may be given to follow up of patients who DNW who are considered to have high risk issues or are from a vulnerable patient group.

EMERGENCY DEPARTMENT - NOTIFICATION OF SPECIALIST OR VMO REGARDING PATIENTS ADMITTED THROUGH THE ED (GL2011_003)

GL2011_003 rescinds GL2005_026.

PURPOSE

The purpose of these guidelines is to provide advice on the development of hospital mechanisms for the notification of Specialists or Visiting Medical Officers of patients admitted through the Emergency Department.

KEY PRINCIPLES

Mechanisms should be in place for the appropriate Visiting Medical Officer or Staff Specialist to be notified of each hospital admission through the emergency department. The notification should be made by the rostered medical officer attending to the patient in the emergency department, prior to the end of his or her shift. In hospitals with specialty registrars, this notification can be made to the appropriate registrar.

All relevant medical practitioners should be educated regarding the need for compliance with the above guideline.

USE OF THE GUIDELINE

Following the recommendation of the State Coroner, these guidelines should be incorporated into written hospital policy in relation to the notification of admitting Visiting Medical Officers or Staff Specialists regarding patients admitting through the emergency department.

The Guideline can be downloaded at http://www.health.nsw.gov.au/policies/gl/2011/GL2011_003.html

TRIAGE IN NSW EMERGENCY DEPARTMENTS (PD2013_047)

PD2013_047 rescinds PD2008_009.

PURPOSE

The purpose of this policy is to outline the key components of triage of patients presenting to Emergency Departments in NSW hospitals including the role, key responsibilities and the processes that support efficient and safe triage.

This policy does not seek to outline the clinical components of this process; clinical information related to triage is as indicated by the Australasian College for Emergency Medicine's (ACEM) policy[15] and guideline[16] on triage and the College of Emergency Nursing Australasia (CENA) Position Statements on Triage.[17,18]

This policy should be read in conjunction with NSW Health Policy **PD2010_075 *Emergency Department Patients Awaiting Care***

MANDATORY REQUIREMENTS

- Triage is an essential function of an Emergency Department (ED). Triage (or an alternative local 'sorting' process by a senior ED clinician) should be the first interaction a patient has in the ED.
- ED and hospital processes must support the ability of triage to be carried out within five minutes or less so as not to delay other patients awaiting triage. This includes limiting the responsibilities and additional tasks required of the Triage Nurse, where appropriate, so that focus can remain on timely triage of patients as they enter the ED.
- The triage process encompasses a brief clinical assessment of the patient on arrival to the ED to determine the priority for clinical care. Assignment of triage category reflects the clinical urgency of the patient's condition.
- The patient's level of urgency is indicated using the Australasian Triage Scale (ATS) and the Triage Nurse determines (in consultation with relevant ED and Ambulance staff if required) the most appropriate place for the patient to commence or wait for further treatment.
- It is recognised that triage is a dynamic process and may require that the patient be re-triaged if their condition changes or deteriorates prior to being seen by a treating clinician.
- The physical location and environment of triage must ensure the safety of staff and patients and accommodate privacy for the assessment of patients.
- The process of Triage involves the application of high-level patient assessment skills and knowledge to determine the patient's degree of urgency to see a treating clinician – it is for this reason that triage in NSW EDs should be carried out by Registered Nurses. It is not appropriate for clerical/administrative staff to undertake triage. In Hospitals with ED role delineation level 1 & 2, there may be occasional circumstances where an Enrolled Nurse is the first point of contact for a patient arriving in the ED. Contingencies for this occurring are described in section 2.5 - Triage Education.

15 ACEM Policy on the Australasian Triage Scale **http://www.acem.org.au/getattachment/693998d7-94be-4ca7-a0e7-3d74cc9b733f/Policy-on-the-Australasian-Triage-Scale.aspx**
16 ACEM Guidelines on the implementation of the Australasian Triage Scale in Emergency Departments **https://www.acem.org.au/getattachment/d19d5ad3-e1f4-4e4f-bf83-7e09cae27d76/G24-Implementation-of-the-Australasian-Triage-Scal.aspx**
17 CENA Position Statement: Triage Nurse http://www.cena.org.au/wp-content/uploads/2014/10/CENA_Position_Statement_Triage_Nurse.pdf
18 CENA Position Statement: Triage and the Australasian Triage Scale http://www.cena.org.au/wp-content/uploads/2014/10/2012_06_14_CENA_-_Position_Statement_Triage.pdf

- Registered Nurses undertaking the triage role must demonstrate and maintain clinical expertise in emergency nursing and have appropriate training in the triage role; the requirements of which will be determined locally. Please see section 2.5 Triage Education for further information on 'expertise in emergency nursing.

IMPLEMENTATION

Local Health District and Specialty Health Networks are responsible for:

i. Assigning responsibility, personnel and resources to implement this policy.
ii. Establishing mechanisms to ensure that the essential criteria are applied, achieved and sustained as usual processes for triage; this should include nomination of an executive sponsor.
iii. Ensuring that any local policy reflects the requirements of this policy and is written in consultation with responsible executive, Clinical Governance unit, ED senior management, and senior clinical staff.
iv. Providing opportunity for Registered Nurses to complete local triage education programs; ensure adequate supervision for Registered Nurses learning the triage role and demonstrate local processes for the ongoing evaluation of triage practice.

1. BACKGROUND

1.1 About this document

Triage is an essential function of an Emergency Department (ED) and must be the first interaction a patient has in the ED. This Procedure Document supports and further explains the mandatory requirements of the *Triage in NSW Emergency Departments Policy* through the following components:

- The purpose and role of Triage.
- Use of the Australasian Triage Scale.
- Re-triage of patients with deteriorating conditions.
- Triage location and safety requirements.
- Triage education.
- Triage of Ambulance patients.
- Telephone advice.
- Mass Casualty Disaster and Triage.

1.2 Key definitions

For the purpose of the Policy Statement and this Procedures Document, the following definitions apply:

Acuity:
Acuity is a synonym for urgency, and they can be used interchangeably. An acuity-based description should answer the question: "This patient should wait for assessment and treatment by a treating clinician no longer than….".

Australasian Triage Scale (ATS):
The Australasian Triage Scale (ATS) is a 5-point scale that is designed for use in hospital-based emergency services throughout Australia and New Zealand. It is used to help sort patients by clinical urgency.

Competency:
Competency refers to the consistent application of knowledge and skill to the standard of performance required in the workplace. It is also the ability to consistently perform work activities; applying skills and knowledge; to agreed standards over a range of contexts and conditions.[19]

Complexity:
Complexity relates to the difficulty of the presenting problem and the resources involved in finding a solution to the problem. A low ATS category with a highly complex problem may consume more resources and workload than a high urgency but low complexity presentation.

Emergency Triage Education Kit (ETEK):
The Emergency Triage Education Kit (ETEK) is a teaching resource that aims to provide a consistent approach to the educational preparation of Australian emergency clinicians for the triage role. In particular the ETEK has been designed to promote the correct use of the ATS. The ETEK can be accessed via: **http://www.health.gov.au/internet/main/publishing.nsf/Content/casemix-ED-Triage+Review+Fact+Sheet+Documents**

Re-triage:
The process of re-triage involves an assessment of the waiting patient who has not been assessed by a clinician responsible for care within the time frame allocated by the initial triage category. The purpose of re-triage is to identify and escalate the care of a patient whose condition is deteriorating, reassign an appropriate triage category and prioritise clinical resources to manage the patient.

Streaming:
Streaming is a predetermined method of allocating patients to a particular treatment cohort during the triage process based on specific criteria. Such criteria may include urgency or complexity, age or presenting problem. Streaming may include allocation to a specific area within the ED, a specific set of resources (eg. medical and nursing teams) or to a patient service external to the ED (eg. specialty clinic). The practice of streaming patient presentations from the point of triage into appropriate care areas is shown to result in improvements in waiting times and ED length of stay.

Transfer of Care:
Transfer of Care in this policy refers to the NSW Health key performance indicator of the percentage of patients arriving by ambulance whose care is transferred from paramedics to ED staff within 30 minutes of arrival. Transfer of Care is defined as the transfer of accountability and responsibility for a patient from an ambulance paramedic to a hospital clinician.

Triage:
Triage is the process of assessment of a patient on arrival to the ED to determine the priority for medical care based on the clinical urgency of the patient's presenting condition. Triage enables prioritisation of limited resources to obtain the maximum clinical utility for all patients presenting to the ED. The triage nurse applies an Australasian Triage Scale category in response to the question: "This patient should wait for assessment and treatment by a treating clinician no longer than….".

1.3 Legal and legislative framework

Duty of Care

By engaging with a patient as they present to the ED, the Triage Nurse enters into a health professional-patient relationship. The Triage Nurse shares the responsibility of the hospital to ensure that patients who present to the ED are offered an appropriate assessment of their urgency of treatment requirements.

[19] http://www.hwa.gov.au/sites/uploads/national-competency-report-final-20120410.pdf.

All nurses should have an understanding of basic legal principles, which include consent, the elements of negligence, definition and sources of the standards of care, and how policies and guidelines can influence practice to maximise patient safety. There is an expectation that the Nurse performing the role of triage will have adequate experience, training and supervision to perform the role. The employing institution also has a responsibility to ensure that triage staff are adequately prepared to perform the role.

Patients who 'Did Not Wait' for treatment following Triage

Patients may choose to leave the hospital without being seen by the treating clinician in the ED; if the patient is competent, the Triage Nurse cannot prevent them from leaving. However, the Triage Nurse has a responsibility to advise the patient of the consequences of such a decision, and appropriate documentation recording this event should be completed (see 'Documentation' section below). Issues must be escalated to the appropriate senior ED clinician in charge of the department as required.

Patients who have a cognitive impairment (e.g. from drug use, alcohol use, a head injury, mental illness, delirium or patients at risk of suicide or with self-harm ideation) are at risk from adverse events in such situations. The Triage Nurse must therefore consider their duty of care in such cases. The Triage Nurse must be aware of and fulfil his or her responsibilities with these patients and abide by any local policies or protocols. For the purposes of triage, a rapid re-triage and/or escalation to senior ED staff may be indicated.

Documentation

Medical records are a method of communication for health care team members and are a contemporaneous record of events. They must be accurate, clear and succinct. It is also expected that the records will be easily accessible and able to be understood[20].

Minimum information that is required to be recorded for any triage episode include the following:
- Date and time of triage assessment.
- Name of the Triage Nurse.
- Presenting problem.
- Relevant clinical assessment findings and limited relevant history.
- Initial triage category allocated.
- Area the patient is allocated or streamed to within the ED.
- Diagnostic, first aid or treatment initiated at triage.
- Type of visit code.

Any change in the patient's condition prior to being seen by the treating clinician must be documented clearly. If re-triage is required; documentation should include:
- The time of re-triage.
- Reason for the re-triage.
- Information about escalation of the patient's change in condition to relevant senior ED staff.

Documentation regarding patients that choose to leave the ED without treatment should detail as much information as is available, including the following:
- Information given to the patient or carer regarding the need to stay for treatment.
- Advice given regarding alternative or ongoing care.

[20] NSW Health Policy 2012_069 Health Care Records – Documentation and Management available **http://www.health.nsw.gov.au/policies/pd/2012/PD2012_069.html**

- The name and position of the clinician that concerns were escalated to.
- The patient's condition on departure.
- The time that the patient left.
- Any action that was taken subsequent to the patient leaving.
- Any other relevant information.

2. COMPONENTS OF THE TRIAGE PROCESS

2.1 The Purpose and role of Triage

Triage is a critical component in the delivery of emergency care, and is the first point of contact and assessment in the patient's ED journey.[21] The purpose and role of triage is to first identify patients with life-threatening or emergency conditions and initiate appropriate interventions (eg. emergency first aid as per local protocols), then second, allocate the patient to an appropriate area or stream within the ED.

ED and Hospital processes must support the ability of triage to be carried out within five minutes so as not to delay other patients awaiting triage. This includes limiting the responsibilities and additional tasks required of the Triage Nurse, where appropriate, so that focus can remain on timely triage of patients as they enter the ED.

Triage is used to determine the patient's clinical urgency; it is not an indicator of complexity of the patient's condition and should not be used as a substitute for this.

Triage involves rapid patient assessment, interpretation of the clinical history and physiological assessment, while objectively discriminating between the ATS categories of urgency. Triage decision-making is inherently complex, made under conditions of uncertainty and with limited or obscure information.

Assessment of clinical urgency is achieved by observation of general appearance, collection of a focused history to identify presenting problem and clinical risk and collections and interpretation of physiological data using a primary survey approach.

It is the responsibility of the Triage Nurse to escalate and engage further assistance from senior ED clinical staff where appropriate.

It is recognised that the triage process relates to managing the queue of patients who present for treatment. Currently this is done consistently by Triage Nurses, however EDs may choose to implement strategies to manage the queue according to local needs (for example, decision making clinicians seeing patients immediately on arrival to the ED).

It is important that the Triage Nurse is competent in identifying and promoting cultural safety for patients that are triaged including access to interpreter services, notification of Aboriginal Liaison Officers where appropriate and is able to access culturally appropriate information regarding triage and the waiting room for patients.

Use of the Australasian Triage Scale

In all NSW EDs, emergency nurses perform the triage role using the ATS. The ATS is a five-point scale used to prioritise patients. An ATS category from one to five is allocated according to the maximum time the Triage Nurse determines the patient can wait for emergency care.

[21] Hodge, A., et al., *A review of the quality assurance processes for the Australasian Triage Scale (ATS) and implications for future practice.* Australasian Emergency Nursing Journal, 2013. **16**(1): p. 21-29.

The Triage Nurse applies an ATS category in response to the question *"this patient should wait for assessment and treatment by a treating clinician no longer than..."*.

ATS Category	Treatment Acuity (maximum waiting time)	Performance Indicator Threshold*
ATS 1	**Immediate**	**100%**
ATS 2	**10 minutes**	**80%**
ATS 3	**30 minutes**	**75%**
ATS 4	**60 minutes**	**70%**
ATS 5	**120 minutes**	**70%**

**Performance Indicator Threshold represents the percentage of patients assigned ATS Category 1 through to 5 who commence clinical assessment and treatment within the relevant waiting time from their time of arrival.*[22]

2.3 Re-triage of patients with deteriorating conditions

It is recognised that triage is a dynamic process and may require that the patient be re-triaged if their condition changes, deteriorates or additional relevant information is received prior to being seen by a treating clinician.

Such relevant information may be received via a source such as: interpreters, Drs letter, family members, past medical records etc.

The process of re-triage involves an assessment of the waiting patient who has not been reviewed by a clinician responsible for care. The purpose of re-triage is to acknowledge any change in clinical condition of a patient and assign a relevant triage category. A patient may be assessed as requiring a higher acuity triage category (due to deterioration).

Documentation is to occur detailing the assessment, application of a new triage category, and necessary discussions or escalation of the patient's condition to a senior ED clinician (Registered Nurse, Medical Officer, Team Leader).

Patients and/or carers should be informed at the time of triage what to do if their condition changes or they become concerned while waiting for care and how the triage system works to prioritise care.

All waiting patients should be regularly assessed by either the Triage Nurse or Clinical Initiatives Nurse (CIN) if available; particularly if the waiting time exceeds the allotted triage category maximum waiting time.

2.4 Triage location and safety requirements

The triage environment must provide safety for the public, the Triage Nurse, staff and patients of the ED. The triage environment must take into account the potential risk of aggressive behaviour of patients or their relatives.

[22] ACEM Policy on the Australasian Triage Scale **http://www.acem.org.au/getattachment/693998d7-94be-4ca7-a0e7-3d74cc9b733f/Policy-on-the-Australasian-Triage-Scale.aspx**

The environment:

- Must be immediately visible and well sign posted.
- Must allow for clear visibility of the waiting room by the Triage Nurse.
- Must have access to an area for patient examination and provision of first aid.
- Must be designed to maximize the safety of the Triage Nurse, staff and patients (eg. duress alarms, egress routes for staff exiting the triage room and access to security personnel).
- Should enable and facilitate patient privacy (a private consultation room is recommended for patient examination).

2.5 Triage education

It is recognised that triage should be completed by *specifically trained and experienced RNs*[23] as:

> *… clinical decisions made by triage nurses require complex cognitive process. The Triage Nurse must demonstrate the capacity for critical thinking in environments where available data is limited, incomplete or ambiguous.*[24]

The Registered Nurse must demonstrate clinical expertise in emergency nursing prior to commencing triage education and training.

The LHD will determine the baseline level of clinical expertise expected of a prospective Triage Nurse; however, new graduate (transitional) nurses should not be eligible to undertake a triage education program. The following is recommended as baseline clinical expertise:[25]

- One-two years full time ED nursing experience (this does not include the New Graduate year).
- Successful completion of the NSW Health '*Transition to Practice, Emergency Nursing Program'* or equivalent transitional program.
- Completion of the Clinical Excellence Commission (CEC)[26]
  - Between the Flags program
  - D.E.T.E.C.T.
  - D.E.T.E.C.T. junior
- Advanced Life Support accreditation
- NSW Health Paediatric Clinical Practice Guidelines e-learning package.[27]

Local decision making should be applied by ED Nursing Managers, Clinical Nurse Consultants and Nurse Educators on readiness of nurses to undertake the triage role where appropriate. Local systems should be in place for Recognition of Prior Learning to ascertain an equivalent level of the development of clinical expertise.

It is the responsibility of the LHD Executive, the Medical Director of the ED (or equivalent), the Nurse Manager of the ED (or equivalent) and LHD Nursing Education service to ensure an adequately resourced, locally relevant, comprehensive triage training and assessment program. It is recommended that the program should encompass the following elements:

- It should be based on the *Emergency Triage Education Kit*[28] (ETEK).
- It should not teach ETEK in isolation, but use it as part of a training and competency based triage program.

[23] **Australasian College for Emergency Medicine (2006) *Policy on the Australasian Triage Scale***
[24] **College of Emergency Nursing Australasia (2009) *Position Statement Triage Nurse***
[25] **Health Policy Priorities Principle Committee (2011) *Australian Triage Process Review***
[26] **Clinical Excellence Commission (2013) *Between the Flags***
[27] **NSW Ministry of Health (2010) Paediatric Clinical Practice Guidelines e-learning package**
[28] **Australian Department of Health and Aging (2009) *Emergency Triage Education Training Kit***

- It should include information about local procedures, processes and nuances.
- It should provide supernumerary support during practical triage training.
- It should ensure that novice triage nurses have access to senior medical and nursing staff for support as they learn the triage role (either in person or via appropriate telecommunications).

At the completion of a triage training program, the Triage Nurse must be able to demonstrate knowledge and/or competence as follows:[29]

- Recall the science and practice of triage.
- Outline the Australian health care system.
- Describe the role of the Triage Nurse.
- Apply the ATS.
- Relate the legislative requirements and considerations.
- Discuss epidemiology and population health.
- Demonstrate effective communication skills including use of electronic medical record systems where appropriate.
- Application of the primary and secondary surveys.
- Apply and synthesize an assessment and triage decision making process by the following presentation types:
  - Trauma.
  - Medical and surgical emergencies.
  - Older persons emergencies and delirium identification.
  - Paediatric emergencies.
  - Obstetric and gynaecological emergencies.
  - Mental health emergencies and the *Mental Health Act 2007*.
  - Rural and isolated triage practice.
  - Environmental emergencies.
- Discuss quality and safety in health care and apply it to triage decision making.
- Discuss cultural safety issues and ensure cultural competence of triage staf.f

It is recognised that in hospitals with ED role delineation level 1 & 2, there may be occasional circumstances when an Enrolled Nurse is the first point of contact for a patient arriving in the ED.

For these contingencies, hospitals must:

1. Have clear processes established in order to rapidly notify a registered nurse of the patient's arrival.
2. Note that Registered Nurses are responsible for formal triaging in all circumstances.
3. Establish training for those Enrolled Nurses likely to encounter these circumstances so that they are equipped to identify high acuity patients.

Ongoing evaluation of performance, updates of clinical practice and professional development must be in place to ensure currency of knowledge and practice for the role of Triage Nurse.

2.6 Triage of Ambulance patients

Patients arriving to the ED via ambulance will be assessed and triaged as per normal ED triage procedures.

Some LHDs may have local protocols in place for rapid triage/triage bypass of specific clinical groups (e.g. ST Elevation Myocardial Infarction, Trauma, Sepsis and Stroke). LHDs are required to ensure that all triage staff are aware of local protocol agreements relating to the triage of specific clinical groups within their ED.

[29] Adapted from **College of Emergency Nursing Australasia (2009) *Position Statement Triage Nurse***

Following triage assessment, the Triage Nurse will determine the most appropriate location within the ED to facilitate transfer of care of patients presenting by ambulance and release of paramedics from care of the patient. This will include allocation of patients to defined clinical areas within the ED or transfer to the waiting room where appropriate, particularly low acuity and low complexity patients for whom staying on the ambulance stretcher is not necessary.

To facilitate Transfer of Care, a clinical handover using a structured approach such as 'IMIST AMBO', must occur between the treating Paramedic and accepting ED clinician. Transfer of Care is deemed complete only when this clinical handover has occurred and the patient has been offloaded from the ambulance stretcher and/or the care of the ambulance paramedics is no longer required.

In the event, that the patient is unable to be offloaded from the ambulance stretcher to an appropriate location within the ED, joint care and monitoring of the patient by ED staff and paramedics will continue until the patient can be offloaded. Transfer of Care should occur as soon as possible.

2.7 Telephone advice

It is not the role or responsibility of the Triage Nurse to provide clinical telephone advice to the public, carers and non-health professionals who may telephone the ED in an attempt to seek emergency and other medical advice.

If the Triage Nurse identifies that a caller is requiring general medical advice they should direct the caller to phone the National Triage Telephone Advice Line (*healthdirect Australia*) on 1800 022 222. If the Triage Nurse identifies that the call may be of an emergency nature, the Triage Nurse should direct the caller to hang up and phone 000 for assistance. If the Triage Nurse identifies that a caller is ringing about a mental health problem, they should direct the caller to phone the NSW Mental Health Line on 1800 011 51.

2.8 Mass Casualty Disaster and Triage

This procedure document outlines the process for ED triage under 'usual' circumstances.

Mass casualty triage, while similar, is distinct from the triage process that has been described in this document. During mass casualty incidents, or 'disasters' the triage process may change. This decision will be made by a hospital disaster controller, or their delegate.[30]

DIRECT ADMISSION TO INPATIENT WARDS FROM EMERGENCY DEPARTMENT
(PD2009_055)

PURPOSE

Timely and efficient handover of clinical care of admitted patients from the Emergency Department medical staff to in-patient medical staff is essential for the safe and effective care of each patient and for maintaining the effective operation of the Emergency Department. An essential component of this transition of responsibility for the clinical care of the patient is timely confirmation of acceptance of the clinical handover by the relevant inpatient clinical team.

This policy directive seeks to avoid delays in the admission of patients from the Emergency Department through the application of a clear local protocol in each hospital. As smaller rural hospital Emergency Departments do not have full time separate Emergency Department medical staff and are supported by general practitioners who also care for admitted patients, this policy directive applies to public hospitals with Emergency Departments designated as level 3 or above.

The key benefit of the development and use of a local protocol is that it provides a prior written agreement developed locally by clinicians setting out which clinical unit/team accepts which patients.

Application of this policy directive will enable a timely and clinically appropriate direct admission of a patient from the Emergency Department where an inpatient clinical team has not confirmed acceptance of the admission of the patient under that team within two hours of the clinical decision that the patient requires admission to the hospital.

MANDATORY REQUIREMENTS

Each hospital must have in place by 31 October 2009 an agreed written local protocol that sets out a decision framework for the transfer of care of a patient requiring admission from the Emergency Department to an inpatient clinical team/unit.

The key components of the local protocol are set out in – *Key Components Local Protocol – Admission Decision Framework*. Where a hospital already has a local protocol, the protocol should be reviewed to ensure that it complies with this policy directive.

The local protocol should be reviewed on a six monthly basis and also updated when the clinical service mix of the hospital materially changes.

IMPLEMENTATION

Chief Executives are to ensure a written local protocol as described in this policy and its associated documents is in place for all hospitals designated level 3 or above with Emergency Departments.

Local protocols should be developed by a local hospital executive lead governance group with input from Emergency Department senior medical staff, clinical units/teams and the Medical Staff Council. This consultative process will ensure that gaps in the draft framework are identified and addressed and that the requisite clinical engagement and commitment occurs.

KEY COMPONENTS LOCAL PROTOCOL – ADMISSION DECISION FRAMEWORK

1. A comprehensive list of clinical conditions for which the hospital is able to provide inpatient care and the clinical team/unit that primarily provides inpatient care for each listed clinical condition. This list will be based on the clinical team/unit skill set.

2. The senior medical staff who are appointed and credentialed to accept admissions in each clinical team/unit listed.

3. If a hospital does not have the facilities or skills to admit certain patients, this should also be clearly stated and an appropriate networked hospital identified which will accept such patients.

4. A clearly set out admission process for patients presenting with co-morbidities, undifferentiated illness or conditions involving more than one clinical discipline (eg. the protocol may set out that a joint admission should occur).

5. An agreed mechanism for ongoing review, improvement and further development of the protocol as issues arise (e.g. a periodic standing agenda item for local clinical unit and medical staff council meetings)

6. A clearly defined dispute resolution process for dealing with unforeseen circumstances with these circumstances then informing the ongoing review and improvement process. The dispute resolution process must NOT delay the admission of a patient from the Emergency Department and transfer of care to an inpatient clinical team in accordance with the protocol.

7. A clear written outline of the agreed admission decision process for patients in the Emergency Department requiring admission to the hospital. The process should comply with the following principles.

Emergency Department inpatient admission process principles

8. Following assessment in the Emergency Department, a senior doctor in the Emergency Department will:
   a. decide if the patient requires admission;
   b. determine the condition(s) necessitating admission;
   c. apply the agreed local protocol to determine the clinical team under whose care the patient will be admitted;
   d. request the clinical team to accept the admission.

9. In situations where there is not agreed acceptance of the admission by the inpatient consultant or team, discussion should take place at the most senior clinical level possible, preferably consultant level, based on the agreed local protocol.

10. If the appropriate admitting team for the patient is unable to be determined by the above steps in the required time frame, then the most senior medical officer who has seen the patient will make the admission decision. In the emergency department the specialist emergency physician would be the most senior medical officer. If an emergency physician is not on duty, another senior medical officer (specialist, registrar or CMO) who has seen the patient will make the decision.

11. A reasonable time for conclusion of this decision-making process would be no more than 2 hours from the time of the clinical decision that the patient requires admission.

- This process must result in a clear decision to admit the patient under a specific consultant or clinical team. The decision-maker must then notify the admitting team. The admitting team will accept the patient once this decision is made. An inpatient consultant who remains unwilling to accept the patient after all these steps have been followed may elect to see the patient and having done so, take personal responsibility for discussing with, and arranging admission under, another consultant.

- Occasions requiring the most senior doctor to make a contested decision to admit the patient under a specific consultant or clinical team must be the subject of a subsequent review at the local hospital level to determine whether further refinement of the local protocol is required, as part of the ongoing review, improvement and further development of the local protocol.

- Should the patient subsequently require transfer to another clinical unit after admission from the Emergency Department under the local protocol, the clinical team on call will arrange this. The local protocol should include prior agreement about processes to expedite the transfer of such patients between units where

This checklist can be used to review the implementation of this policy directive.

NSW RURAL ADULT EMERGENCY CLINICAL GUIDELINES (GL2022_004)

GL2022_004 rescinds GL2020_004

GUIDELINE SUMMARY

This Guideline is provided to assist early appropriate clinical management of acute and lifethreatening conditions, and to relieve pain and discomfort, for patients at hospitals where medical officers are not immediately available.

KEY PRINCIPLES

The Guidelines reflects evidence based best clinical practice and expert consensus opinion to standardise initial clinical management of specific adult conditions.

A graduated clinical response is required, dependant on:

- Severity of the presenting emergency condition e.g. the clinical response to patients with mild to moderately severe asthma is different to that of a patient with immediately life-threatening asthma.
- Level of training and expertise of the nursing staff who initiate the management of the patient i.e. Registered Nurses with advanced clinical training will practice more advanced interventions.
- Legal requirements for Nurses who initiate treatment and administer medications based on medication standing orders.
- Need for flexibility to respond to input from senior clinical staff and medical officers to accommodate local circumstances

Alignment with the principles outlined in the First Line Emergency Care Course (FLECC) for Registered Nurses. These nurses have advanced knowledge and skills; and have been deemed competent to carry out these advanced roles using contemporary assessment and ongoing credentialing processes.

The Guidelines can be used by any First Line Emergency Care Course (FLECC) credentialed nurse in the following settings:

- Emergency Department in the absence of a medical officer
- In inpatient areas where a medical officer is not immediately available for patients who fall into the “Clinical Review” or “Rapid Response” criteria of the NSW “Between the Flags” program. Implementation is to occur in conjunction with the activation of the local clinical emergency response system (CERS).

When a Registered Nurse who is recognised as a First Line Emergency Care Course credentialed nurse uses these Guidelines, the designated Medical Officer will be notified immediately.

Medication standing orders contained and utilised in the Guideline will be reviewed and authorised by the designated medical officer as soon as possible (within 24 hours) and the medical officer will countersign the record of administration on the patients’ medication chart.

Enrolled Nurses and Registered Nurses who are not First Line Emergency Care Course credentialed can use these Guidelines to inform assessment and management, however are not permitted to undertake shaded interventions that require First Line Emergency Care Course credentialing unless formal previous recognition of prior learning has been granted.

These Guidelines can be commenced on any adult patient who meets the clinical severity prompt criteria on any specific condition within the guidelines.

In circumstances where the patient meets more than one guideline the most life-threatening condition must take priority and the most appropriate corresponding guideline commenced.

The Guidelines can be downloaded from:
https://www1.health.nsw.gov.au/pds/Pages/doc.aspx?dn=GL2022_004

RESPONDING TO SEXUAL ASSAULT (ADULT AND CHILD) POLICY AND PROCEDURES (PD2020_006)

PD2020_006 rescinds PD2005_614 and PD2005_607

PURPOSE

This Policy Directive provides policy and practice guidance to NSW Health services in responding to children, young people and adults who have, or may have, been sexually assaulted and their families, carers and significant others. It details the functions and governance of NSW Health Sexual Assault Services and clarifies the responsibilities of other NSW Health services in responding to sexual assault.

SUMMARY OF MANDATORY REQUIREMENTS

This Policy requires that Local Health Districts (districts) and Speciality Health Networks (networks):

- Prioritise the health, safety and wellbeing of people who have experienced sexual assault (adult and child).
- Provide an integrated response to sexual assault within a public health approach.
- Adhere to the identified principles of intervention for responding to sexual assault.
- Comply with key reporting requirements related to sexual assault.
- Follow identified procedures and protocols for responding to sexual assault in Emergency Departments.
- Deliver services in ways that increase health, safety and wellbeing and minimise harm. This includes services seeking to prevent re-traumatisation and to ameliorate the impact of sexual assault on the person who has experienced it and their families/significant others.
- Deliver services in a way that is culturally safe and responds sensitively to people's needs, including the experiences of identified population groups with specific vulnerabilities and additional barriers to accessing services.
- Collaborate with interagency partners at local and district levels in responding to sexual assault.
- Ensure every district has at a minimum one Level 4 (or Level 6) Sexual Assault Service (SAS) within their geographic boundaries which provides 24 hour integrated psychosocial, medical and forensic crisis responses for both adults and children as well as the full range of other identified elements of the SAS service model. For a SAS to qualify as a Level 4 as per the NSW Health ***Guide to the Role Delineation of Clinical Services*** it will meet the identified minimum requirements.
- Apply the clinical processes, practices and management requirements for SASs set out in the Responding to Sexual Assault (adult and child) Policy and Procedures, including information sharing and records requirements.
- Comply with the NSW Health **Violence, Abuse and Neglect (VAN) Service Standards**.

IMPLEMENTATION

Chief Executives are responsible and accountable for:

- establishing mechanisms to ensure the directives and requirements of the *Responding to Sexual Assault (adult and child) Policy and Procedures* are applied, achieved and sustained;
- ensuring NSW Health staff understand and are aware of their obligations in relation to the *Responding to Sexual Assault (adult and child) Policy and Procedures* and related policies and procedures;
- ensuring resources are available to deliver and meet the directives and requirements of the *Responding to Sexual Assault (adult and child) Policy and Procedures*;

- ensuring that NSW Health staff are trained to operationalise and implement the *Responding to Sexual Assault (adult and child) Policy and Procedures*;
- communicating with the Ministry of Health through the Prevention and Response to Violence, Abuse and Neglect (PARVAN) Unit on reporting, communications and performance in relation to the *Responding to Sexual Assault (adult and child) Policy and Procedures*; and
- ensuring NSW Health staff are advised that compliance with the *Responding to Sexual Assault (adult and child) Policy and Procedures* is part of their patient / client care responsibilities.

Managers of NSW Health SAS and other NSW Health services specified in the *Responding to Sexual Assault (adult and child) Policy and Procedures* are responsible for:

- ensuring the requirements of the *Responding to Sexual Assault (adult and child) Policy and Procedures* are disseminated and implemented in their service; and
- monitoring implementation and compliance with the *Responding to Sexual Assault (adult and child) Policy and Procedures*.

NSW Health workers are responsible for:

- Implementing and complying with the directives and requirements of the *Responding to Sexual Assault (adult and child) Policy and Procedures.*

For the complete *Responding to Sexual Assault (Adult and Child) Policy and Procedures* document go to:
https://www1.health.nsw.gov.au/pds/Pages/doc.aspx?dn=pd2020_006

DOMESTIC VIOLENCE - IDENTIFYING AND RESPONDING (PD2006_084)

The *Policy and Procedures for Identifying and Responding to Domestic Violence* (2003) http://internal.health.nsw.gov.au/pubs/p/pdf/procedures_dom_violence.pdf provides a framework for informing domestic violence responses for staff in hospitals and community health services. This document's child protection focus has been improved by amendments as detailed below.

It is important to note the inclusion of the following additional text in *section 3.1 Identification of domestic violence* (page 9), procedures section after the paragraph commencing "*Ask about safety*":

"*Ask about child safety:*

- *Do you have children? (If so) have they been hurt or witnessed violence?*
- *Who is/are your child/ren with now? Where are they?*
- *Are you worried about your child/ren's safety?*

Health workers must make a report to the Department of Community Services Helpline on 133 627 where he or she has reasonable grounds to suspect a child is at risk of harm."

Procedures in *Section 3.2.2, Counselling interventions with victims* (page 13) have also been amended by deleting and replacing dot point six under "*Assess safety*" with the following text:

"*Are there children involved? Who is/are your child/ren with now? Are they safe? Was/were your child/ren nearby when your partner was violent to you?" Health workers must make a report to the Department of Community Services Helpline on 133 627 where he or she has reasonable grounds to suspect a child is at risk of harm (refer to Section 4.5 – Children and domestic violence)"*

It is recommended that any hard copies of the document *Policy and Procedures for Identifying and Responding to Domestic Violence* (2003) in circulation also be amended accordingly.

Living with domestic violence has a serious impact on short- and long-term psychological, emotional and physical health of victims and their children. The aim is to help reduce the incidence of domestic violence through the provision of primary and secondary prevention health care services, and to minimise the trauma that people living with domestic violence experience, through tertiary prevention approaches including ongoing treatment and follow-up counselling.

The term "domestic violence" is used to refer to abuse and violence between adults who are partners or former partners. NSW Health has existing policies and strategies that address other forms of violence that are commonly experienced. Health workers may find this policy can provide guidance in responding to situations where similar dynamics occur, in particular the section on legal responses for domestic violence.

The policy and procedures were developed by the NSW Department of Health in consultation with Area Health Services, interagency partners and non-government organisations.

A core component of the policy is routine screening for domestic violence, which is to be implemented for women attending antenatal and early childhood health services and women aged 16 years and over attending mental health and alcohol and other drugs services in accordance with the policy. *Routine screening for domestic violence in NSW Health: an implementation package* provides the screening protocol, guide for managers and the learning program:
http://www.health.nsw.gov.au/publications/Publications/Domestic_Violence_Screening.pdf

DOMESTIC VIOLENCE – MEN'S BEHAVIOUR CHANGE PROGRAMS (IB2014_003)

PURPOSE

To provide information about Men's Domestic Violence Behaviour Change Programs.
This information should be read in conjunction with the *Policy and Procedures for Identifying and Responding to Domestic Violence* PD2006_084. Where the information differs, the information in this bulletin applies.

The Policy and Procedures for Identifying and Responding to Domestic Violence are being reviewed in 2013 and the advice in this Information Bulletin will be incorporated into any new Policy Directive.

KEY INFORMATION

In NSW, there are a range of men's domestic violence behaviour change programs, provided by Government and non-government services. These are provided in custodial settings, by welfare groups and by counselling services, and are a valuable service to men seeking to change their abusive behaviour.

The NSW Government has introduced minimum standards for men's domestic and family violence behaviour change programs. The standards will significantly improve the safety of victims of domestic violence and assist those attending programs to stop the violent behaviour. The minimum standards aim to reflect good practice, and foster programs that are safe and effective in changing behaviour.

The standards apply to all group programs for male perpetrators of domestic and family violence in NSW. This includes programs run by government agencies, including NSW Health agencies. It also includes programs run by non-government agencies.

NSW Health responsibilities

The minimum standards are NSW Government policy, and the Director General has signed a formal agreement with the Department of Attorney General and Justice to implement the minimum standards. To comply:

- NSW Health staff should only refer patients/clients to complying programs listed at **http://www.domesticviolence.lawlink.nsw.gov.au/**;
- Where any NSW Health agency provides funding to Men's Behaviour Change Programs, any new or revised funding agreement should require compliance with the minimum standards;
- Where any NSW Health agency provides funding to relevant community services, new or revised funding agreements should include a clause requiring those NGO staff to refer clients/patients only to programs complying with the Minimum Standards. These services may include Aboriginal Medical Services, Women's Health Centres, multicultural services, Family Planning services, Lifeline, mental health & drug and alcohol services, health services for the homeless, youth services, and victim support services;
- NSW Health staff with concerns or complaints about programs, should report this directly to the Domestic and Family Violence Unit, Crime Prevention Division, Department of Attorney General and Justice at **http://www.domesticviolence.lawlink.nsw.gov.au/** or 02 8688 3277.

The Principles and Minimum Standards

1. **Principle**: The safety of women and children must be given the highest priority.
   - 1.1. **Standard**: Program providers will develop and operate from written procedures that address risks to women and children.
   - 1.2. **Standard**: Program providers will ensure that current partners of program participants are provided with support prior to and during the program.
   - 1.3. **Standard:** Partner support workers will prepare women for the participation of their partners in the behaviour change group program.
   - 1.4. **Standard:** Partner support workers will complete individual risk assessments and safety plans.
   - 1.5. **Standard:** The contact worker is to disclose to women any new expressed or perceived threat to their safety.

1.6. **Standard:** Where women and children express an interest in having ongoing contact from a partner support worker, additional contact will occur for the duration of the program.
1.7. **Standard:** Group facilitators and partner support workers will have approach knowledge and training about the impact of domestic and family violence on women and children.
1.8. **Standard:** Partner support workers must have relevant knowledge, training and experience to enable them to support and advocate for women and children.

2. **Principle:** Victim safety and offender accountability are best achieved through an integrated, systemic response that ensure that all relevant agencies work together.
2.1. **Standard:** To ensure program transparency, accountability and integration program providers will develop a formal relationship with relevant local agencies.

3. **Principle:** Challenging domestic and family violence requires a sustained commitment to professional and evidence-based practice.
3.1. **Standard:** Group facilitators must have relevant knowledge and training.
3.2. **Standard:** All programs will have a minimum of two group facilitators.
3.3. **Standard:** Group facilitators must undertake supervision.
3.4. **Standard:** Program providers will develop policies to ensure that group facilitators undertake ongoing professional development.
3.5. **Standard:** Behaviour Change Group Programs will have a duration of at least 24 hours over 12 weeks.
3.6. **Standard:** Program providers will complete an operational review of each program focussing on process and content.
3.7. **Standard:** Program providers will evaluate the impact of programs on the behaviour and attitude of group participants.
3.8. **Standard:** Program providers will contribute to an evidence base for behaviour change programs.

4. **Principle:** Perpetrators of domestic and family violence must be held accountable for their behaviour.
4.1. **Standard:** Programs must be grounded in an evidence-based theory of change.
4.2. **Standard:** Program providers will document and implement thorough participant assessment procedures.
4.3. **Standard:** Program provider will have procedures for engaging participants which challenge them to acknowledge their abusive behaviour.
4.4. **Standard:** Program content will include explicit information about the impact of domestic and family violence on women and children and women's disproportionate experience of domestic violence.
4.5. **Standard:** Program content will include information on different forms of domestic and family violence and provide opportunities for participants to come to an understanding about the nature of their offending behaviour.
4.6. **Standard:** Program providers will develop procedures for non-attendance of mandated participants.
4.7. **Standard:** Program providers will have procedures for group facilitators to prevent their implicit or explicit collusion with participants' attitude that support violence against women.
4.8. **Standard:** Program providers will offer appropriate referrals to meet participants' additional needs.
4.9. **Standard:** Program providers must comply with the requirements of a referring agency for a report on the participant's completion of a program.

5. **Principle:** Programs should respond to the diverse needs of the participants and partners.
5.1. **Standard:** Program facilitators must undertake training to ensure culturally competent practice.
5.2. **Standard:** Programs addressing other forms of family violence will be specific to the participant's needs.

Further information can be found at **http://www.domesticviolence.lawlink.nsw.gov.au/**.

To view the Minimum Standards for Men's Domestic Violence Behaviour Change Programs on the Attorney General and Justice website go to **http://www.domesticviolence.lawlink.nsw.gov.au/agdbasev7wr/_assets/domesticviolence/m422001l2/dfv_behaviour_change_program_standards_april_2012.pdf**

200(30/01/14)

DOMESTIC AND FAMILY VIOLENCE MIGRATION REGULATIONS: RELEVANCE FOR HEALTH WORKERS (IB2018_017)

PURPOSE

This Information Bulletin outlines the special provisions relating to domestic and family violence (DFV) contained in the *Migration Regulations 1994* (the provisions) of the *Migration Act 1958.* It also describes support which can be offered to victims of DFV, in addition to clinical services, by certain professional experts within NSW Health.

This Information Bulletin expands on issues raised in the NSW Health *Policy and Procedures for Identifying and Responding to Domestic Violence 2006*, regarding clients from culturally and linguistically diverse backgrounds affected by DFV, who hold certain temporary visas.

KEY INFORMATION

The provisions ensure that persons in Australia on certain temporary visas do not feel compelled to remain in abusive relationships in order to stay in Australia.

The provisions are usually invoked by persons on temporary partner visas or prospective marriage visas, who are in the process of applying for a permanent partner visa. The provisions allow these persons to remain in Australia and apply for permanent residence, even though, as a result of DFV and a relationship breakdown, they do not meet the ordinary requirements to obtain a permanent partner visa.

The provisions can also be invoked by persons on certain skilled stream visas in some circumstances.

Victims of DFV seeking to invoke the provisions must substantiate their claims by proving their relationship was genuine until it ended and that DFV took place during the relationship in Australia.

If the victim's claim of DFV has not been heard by a court, that person can provide the following as evidence that DFV took place during their relationship:

- a statutory declaration (form number 1410 for DFV claims first made on or after 24 November 2012, or form number 1040 for claims made on or after 15 October 2007); and
- two items of evidence from **professional experts**.

The *Migration Regulations 1994 - Specification of Evidentiary Requirements - IMMI 12/116* (IMMI 12/116) provides information on acceptable items of evidence from **professional experts**. Victims of DVF must present at least two of the types of evidence listed in IMMI 12/116 in support of their claim. They cannot present two items of evidence of the same type.

NSW Health workers categorised as **professional experts** include registered medical practitioners, nurses or psychologists and members or eligible members of the Australian Association of Social Workers. Professional experts within NSW Health may provide a statement in a statutory declaration or an official letter with relevant supporting documents in their professional capacity, including a medical report, hospital report or a discharge summary. Their evidence must include:

- details of the violence, identifying all individuals involved;
- evidence or reasons for any opinion or assessment;
- details about their professional relationship with the victim; and
- information regarding services and support offered or provided to the victim.

Professional experts within NSW Health should proactively follow up by asking about the safety of the victim - if they are safe to go home, if they need assistance to go home or a safe place as per the NSW Health policy on *Identifying and Responding to Domestic Violence* PD2006_084.

Professional experts within NSW Health should also identify if children are involved in the violence by asking victims directly. If so, questions should be asked about this - if children have been hurt or witnessed violence, where and who are the children with, and if victims are worried about the children's safety.

Professional experts within NSW Health are also required to follow mandatory reporting protocols if they suspect that a child is at risk of significant harm.

The NSW Mandatory Reporting Guide should be used as part of this assessment and reports to the Child Protection Helpline should be made where indicated.

NEW SOUTH WALES HEALTH SERVICES FUNCTIONAL AREA SUPPORTING PLAN (NSW HEALTHPLAN) (PD2014_012)

PURPOSE

NSW HEALTHPLAN details the health emergency management arrangements to ensure that health resources in NSW are effectively and efficiently coordinated in the event of emergencies through prevention, preparation, response and recovery.

MANDATORY REQUIREMENTS

NSW HEALTHPLAN is the NSW Health Services Functional Area Supporting Plan to the NSW State Emergency Plan (EMPLAN) developed pursuant to the State Emergency and Rescue Management Act 1989 (as amended).

The plan outlines the agreed roles and functions of the eight key contributing health services (Medical Services, Ambulance Services, Mental Health Services, Public Health Services, Health Communications, HealthShare NSW, NSW Health Pathology and The Sydney Children's Hospital Network), which constitute a whole of health response incorporating an all-hazard approach.

NSW Health is designated as the Combat Agency for all health emergencies within NSW under the NSW State Emergency Plan (EMPLAN).

The principal position holder for health emergency management is the State Health Services Functional Area Coordinator (State HSFAC) who is contactable on a 24 hour basis.

The policy directive *Emergency Management Arrangements for NSW Health* PD2012_067 outlines the mandatory requirements, governance and operational arrangements for the Local Health Districts and the Health Service Functional Area Coordinators.

IMPLEMENTATION

New South Wales Health Services Functional Area Supporting Plan (NSW HEALTHPLAN) will replace NSW HEALTHPLAN PD2009_008 (v3.5 December 2009).

An e-learning package has been developed and distributed to the Local Health Districts to support the release of this policy and an online learning package is available through Interaction Pulse for NSW Ambulance.

PD2014_012 can be downloaded at **http://www.health.nsw.gov.au/policies/pd/2014/PD2014_012.html**

MAJOR INCIDENT MEDICAL SERVICES SUPPORTING PLAN (GL2018_017)

GL2018_017 rescinds GL2010_011, PD2009_080 and PD2009_048

PURPOSE

The attached plan is the NSW Health Major Incident Medical Services Supporting Plan supporting the NSW Health Services Functional Area Supporting Plan (NSW HEALTHPLAN) developed pursuant to the State Emergency and Rescue Management Act 1989 (as amended).

The purpose of the NSW MAJOR INCIDENT MEDICAL SERVICES SUPPORTING PLAN (NSW MEDPLAN) is to enable medical service resources to be varied from business as usual arrangements and effectively and efficiently coordinate the resources in the event of major incidents requiring a significant and coordinated medical response.

The NSW MEDPLAN details the arrangements to be adopted by NSW Health in order to coordinate all of the hospitals and medical services resources available in NSW (both government and non-government) to the State HSFAC and State Medical Controller for the response and recovery from the impact and effects of a major incident.

The arrangements in this plan will also provide guidance for the preparation of the Local Health District/Network medical services arrangements and procedures of the LHD HEALTHPLAN.

KEY PRINCIPLES

The following principles underpin the NSW MEDPLAN:

1. The Plan shall be read in conjunction with NSW HEALTHPLAN.
2. The provisions defined in the NSWHEALTHPLAN (Part 3) for prevention and preparation responsibilities in a health emergency for NSW Medical services apply.
3. The provisions of the NSW MEDPLAN should not inhibit the LHD instigating a local response, if required.

The plan assigns responsibility to the State Medical Services Controller for hospitals and medical services once the NSW MEDPLAN has been activated by the State Health Services Functional Area Coordinator (HSFAC) such that:

a. the management of multiple casualties and potential casualties is centrally coordinated (both government and non-government)
b. definitive care is provided as rapidly as possible. This may require deployment to the incident, receiving hospitals or other emergency centres.

The plan identifies recommended actions under four phases: Prevention, Preparation, Response and Recovery. Actions under the Prevention and Preparation phases are identified in the NSW HEALTHPLAN and are recommended to be carried out on a continual basis. Actions under the Response and Recovery phases (Parts Three and Four) are recommended to be carried out once the NSW MEDPLAN has been activated by the State Health Services Functional Area Coordinator (State HSFAC).

The primary role for medical services in the response phase will be to manage multiple casualties and potential casualties using central coordination to ensure the provision of definitive care as rapidly as possible.

USE OF THE GUIDELINE

The NSW MEDPLAN:

a. Covers the governance structure for standby, response and recovery for major incident management [Part Three – Four].
b. Addresses the coordination of all hospitals and medical services in NSW (both government and non-government) for response to and recovery from major incidents [Annex One].
c. Assigns responsibility to the State Medical Services Controller for the statewide coordination of hospitals and medical services so that the management of multiple casualties is centrally coordinated. This ensures that definitive care is provided as rapidly as possible.
d. May require deployment of Scene Medical Commander(s) and Emergency Medical Teams either to assist hospitals overwhelmed by casualties or to the incident.
e. Represents the first hours of a major incident and not a protracted event.

Responsibilities of key parties are detailed in Part Two of the NSW MEDPLAN. Action Cards for specific position holders are listed in Annex Three with specific actions.

Details for the Concept of Operations for LHDs are listed in Annex Four. The plan should be communicated to those with roles and responsibilities under this plan and the HEALTHPLAN.

Reporting and Governance of this Plan and key parties are outlined in Annex One.

https://www1.health.nsw.gov.au/pds/Pages/doc.aspx?dn=GL2018_017

MASS CASUALTY TRIAGE PACK – SMART TRIAGE PACK (PD2017_037)

PD2017_037 rescinds PD2011_044

PURPOSE

This policy specifies the use of Mass Casualty Triage Pack - SMART Triage Pack in a mass casualty situation to denote the priority for treatment under the Medical Service Supporting Plan (GL2010_011).

MANDATORY REQUIREMENTS

This policy sets the requirements for the use of the SMART Triage Packs for mass casualty triage, documentation in the field and when patients are immediately transported to hospital. The SMART Triage Tags form part of the patient's health record.

In Local Health Districts, the SMART Triage Packs form part of the Health Response Team Medical Equipment list requirement (PD2009_080). NSW Ambulance carries SMART Triage Packs across all ambulance vehicles for use in mass casualty incident.

IMPLEMENTATION

This policy replaces PD2011_044 Mass Casualty Triage Pack – SMART Triage Pack which was implemented across Local Health Districts and Ambulance Services of NSW in 2011.

SMART Triage Packs are included in the HealthShare NSW catalogue.

Local Health Districts

Local Health Districts are responsible for:

- Ensuring that the policy is brought to the attention of staff who are responsible for maintenance, storing, management and use of the SMART Triage Packs.
- Ensuring staff are appropriately trained in the use of the Kits.
- Ensuring Health Response Team Kits within the Local Health District are stocked with two (2) SMART Triage Packs.

NSW Ambulance

NSW Ambulance is responsible for:

- Ensuring that the policy is brought to the attention of staff who are responsible for maintenance, storing, management and use of the SMART Triage Packs.
- Ensuring staff are appropriately trained in the use of the Kits.
- Replacing and maintaining the stock of SMART Triage Pack items in NSW Ambulance fleet.

NSW Health Emergency Management Unit

NSW Health Emergency Management Unit is responsible for:

- Reviewing and updating this policy every three (3) years or earlier if any request is made to NSW Health Emergency Management Unit following a mass casualty incident or operation.
- E-learning package for Mass Casualty Triage Training.

Mass Casualty Triage & SMART Triage Packs - Procedures

1. BACKGROUND

1.1 Triage Process

Triage was first introduced in a military context as a system of sorting the casualties for medical treatment in the field. In recent decades, the triage concept has been adopted and implemented in the disaster medical management and emergency departments.

In the context of medical management in a mass casualty situation, the aims of triage are not only to deliver the right patient to the right place for optimal treatment, but also to 'do the greatest good for greatest number' with medical resources which should not be diverted to treating an irrecoverable condition.

1.2 Australian Standard Mass Casualty Triage Tags

In 2010, the SMART Triage Tags were approved as an Australian standard mass casualty triage label by the Council of Ambulance Authorities (CAA) following consultation with jurisdictional Health Departments.

The SMART Triage Tags provide a standard tool for mass casualty triage process in a mass casualty incident. The tags provide a national consistent approach to mass casualty triage across Australia[31].

The SMART Triage Tags meet world's best practice and have been tested and evaluated for Australian conditions.

2. SMART Triage Pack

2.1 Personal SMART Triage Pack

The personal SMART Triage Pack (Red colour for Ambulance Services and Green colour for Health Response Teams) consists of:

- SMART Triage Tags
- Triage Sieve and Casualty Count Chart
- Paediatric SMART Tape
- CBR Tag
- Light stick and pencils

Photo source: SMART TAG™

Health Response Team Kits are to have two (2) SMART Triage Packs per kit.

[31] 1 Aitken, P. & Fitzgerald, G., (2012) Disaster triage: Evidence, consistency and standard practice. Emergency Medicine Australasia 2012 24,222-224.

2.2 Commander Triage Pack

The Commander Triage Pack, located in ambulance supervisor vehicles, includes:

- Incident Control Boards – detachable and Velcro to the Commander pack
- Document holders for maps and plans
- SMART Triage Tags
- Dispatch panels for holding the Transport tags
- Internal pockets for additional equipment

2.3 SMART Triage Tag

The SMART Triage Tag is a variable triage tag that enables field documentation. The tag is durable, waterproof and can be written on when wet.

Each Mass Triage Tag has an individual barcode and unique identifier number. The unique identifier number shall be recorded in all patient documentation. Each SMART Triage Tag also has a plastic bag with main pocket for Triage Tag and a small front pocket when using a CBR (Chemical, Biological & Radiation) Tag.

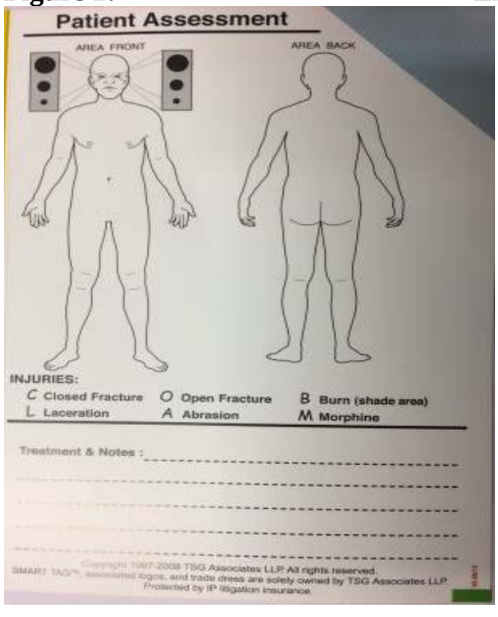
Figure 1:

The SMART Triage Tag has a prominent priority numbering and matching colour system on the tag (Figure 1). A separate Black colour triage tag is used for deceased persons (Figure 1).

The blue colour corner (Figure 2) of the SMART Triage Tag is referred to as the Fourth Priority or Expectant. The Expectant priority refers to a patient whose condition is so severe that they cannot survive despite the best available care. The Expectant category will only be used in NSW following a major or catastrophic event where the number and criticality of patient(s) significantly diverts medical resources from the salvageable patient who may then be compromised.

The authorisation to implement this category can only be given by the State Health Services Functional Area Coordinator (HSFAC) following clinical discussions with the Medical Supervisor on site as outlined in NSW Ambulance Major Incident Response Plan (NSW AMPLAN).

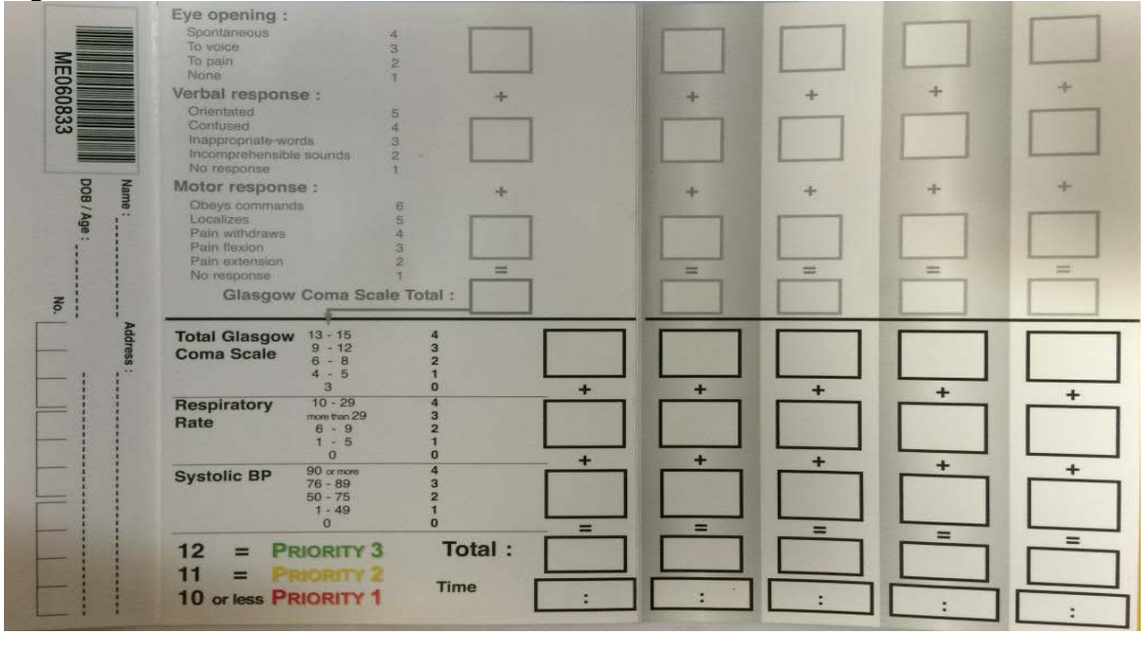
Figure 2: Expectant (Blue) category corner



The SMART Tag provides documentation for recording patient changes in condition. The tag can be refolded to display a different priority without losing the important patient information already recorded on the tag.

Time should be recorded on the tag using 24 hour time (00:00-23:59).

Figure 3:

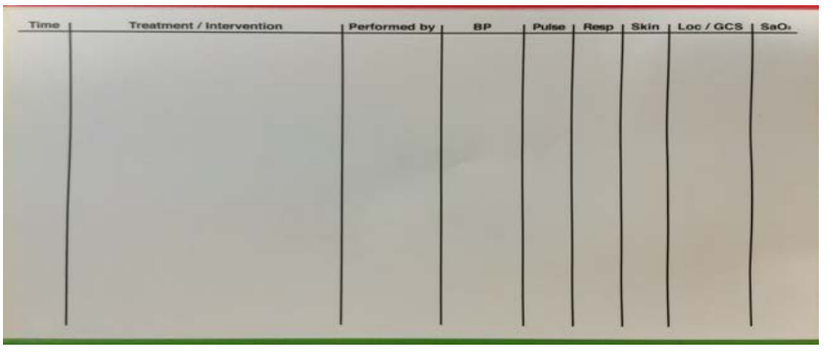


Before the patient is transferred to definitive health care facility, the Ambulance Loading Point Officer will complete and remove the transport tag (at the side of the SMART Triage Tag) for records (Figure 4). This documentation enables the tracking and accounting of the casualty's movement and destination.

Figure 4:

The SMART Triage Tag will remain attached to the patient who is then transferred to the definitive care destination.

The card allows further patient information to be recorded as necessary:

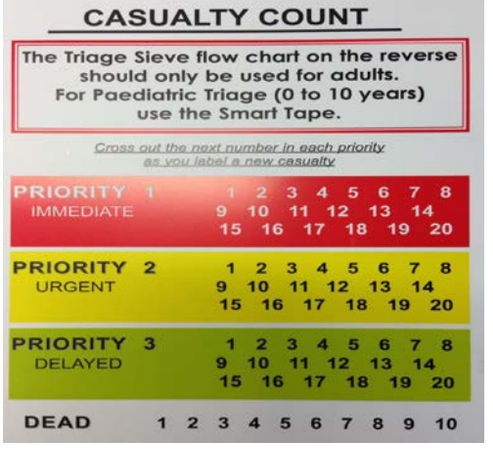


2.4 Casualty Count Chart

A double sided card with the casualty count chart (Figure 5) and adult triage sieve process is attached to the SMART Triage Pack with an elastic band. The chart provides a quick reference of the triage sieve process and a casualty count record is a document than can be used by to track the number of casualties and the clinical acuity.

The care is made from the same durable material as the SMART Triage tags.

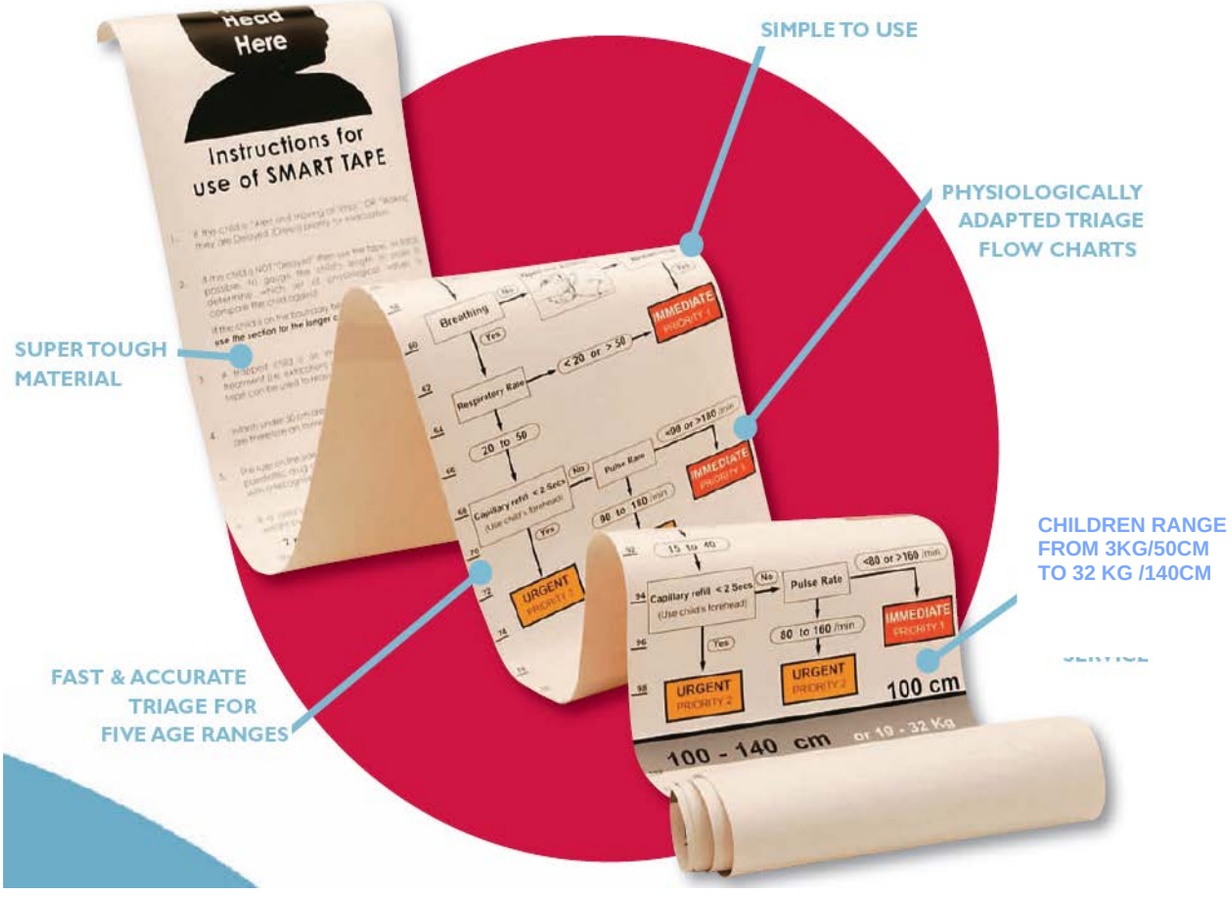
Figure 5:



2.5 Paediatric SMART Tape

The durable Paediatric SMART Tape is an evidence based system[33] [34]and is to be used as a non-biased triage decision for children from 3kg/50cm to 32kg/140cm[35]. The Paediatric SMART Tape allows a triage sieve to be performed on any child less than 32kg. The use of this tool has been incorporated into the existing Health and Ambulance training programs.

If resources or time do not permit, the adult triage sieve can be used for paediatrics, however this may result in the over triage of a paediatric casualty.



2.6 CBR Tag[36]

The Chemical Biological and Radiological (CBR) Tag provides a form to record the details for contaminated casualties from an incident involving chemical, biological, radiological or infectious agents. The CBR Tag allows recording of particular agents, decontamination and any use of auto-injectors.

The CBR Tag DOES NOT replace the SMART Triage Tag and does not have the unique identifier barcode and number. The CBR Tag must be used in conjunction with the SMART Triage Tag.

[33] Hodgetts, T., J. Maconochie, C. & Smart, C (1998). Paediatric triage tape. Pre-hospital Immediate Care 2:155-159.
[34] Wallis, LA & Carley, S (2006) Validation of the Paediatric Triage Tape, Emergency Medicine Journal. Jan: 23 (1):47-50.
[35] Sandell, J. M. & Charman, S.C (2009). Can age-based estimates of weight be safely used when resuscitating children? Emergency Medicine Journal 2009;26;43-47.
[36] The term 'WMD" used in the SMART Triage Pack or Education Pack, should be referred as "CBR". "WMD' is a term used in USA but not in Australia. In Australia, the term "CBR" is used instead.

The unique identifier number of the victim's SMART Triage Tag is required to be documented on the CBR Tag. The completed CBR Tag is to be inserted in the front clear plastic pocket of the SMART Triage Tag.

Photo source: SMART TAG™

3. Training

The SMART Triage Pack has been incorporated in the Major Incident Medical Management and Support (MIMMS) course and Ambulance training programs.

An e-learning package has been developed for all staff within NSW Health and NSW Ambulance and is available on My Health Learning. The course code for Mass Casualty Triage Training is 122605241.

NSW Health and NSW Ambulance have trainers that can provide education in th SMART Triage System.

4. Ordering Requirement and Details

SMART Triage items can be ordered through the HealthShare NSW catalogue with the following details (as sock items):

HIMF Number	Description
710779	DISASTER TRIAGE TAG, **SMART TRIAGE** TAG
710789	DISASTER TRIAGE TAG, **CBRN/HAZMAT** TAG
710787	DISASTER TRIAGE TAG, **DECEASED** TAG –
710782	DISASTER TRIAGE TAG, SMART CASUALTY CARD, SIEVES (Pack5) – **Triage Sieve Algorithm / Casualty Count Card**
710783	DISASTER TRIAGE TAG, SMART TAPE, CHILD - **Paediatric Triage Tape**
710780	DISASTER TRIAGE TAG, RE-SUPPLY FOR SMART TRIAGE KIT - **Contents only – no bag**
788136	DISASTER PACK, ***EMPTY***, SMART TRIAGE, RED - **Empty bag – for re-issue if contaminated** ***Note: LHDs will need to order replacement green bags directly from Midmed**
710790	DISASTER PACK, SMART TRIAGE KIT, RED - **Full kit with contents** ***Note: LHDs will need to order replacement green bags directly from Midmed**

* For Replacement of the Green bags by LHDs, non-stock orders are to be quoted and ordered with the Supplier: MIDMED PTY LTD - 1300 643 633 www.midmed.com.au

CLOSED HEAD INJURY IN ADULTS – INITIAL MANAGEMENT (PD2012_013)

PD2012_013 rescinds PD2008_008.

PURPOSE

The purpose of this policy is to advise that the *Initial Management of Closed Head Injury in Adults* clinical practice guideline has been updated to reflect the latest evidence based practice for the management of adults with a closed head injury. The guideline provides clinicians with practical evidence based recommendations to assist in the initial management of adults with mild, moderate and severe head injury.

The policy is to ensure that all Local Health Districts have protocols in place based on the key principles of the guideline.

The clinical practice guideline was prepared for the Ministry of Health by an expert clinical reference group under the auspice of the NSW Institute of Trauma and Injury Management.

MANDATORY REQUIREMENTS

This policy requires all health services to have local guidelines/protocols based on the clinical practice guideline in place in all hospitals and facilities likely to be required to assess or manage patients with a closed head injury.

The clinical practice guideline reflects what is currently regarded as a safe and appropriate approach to the acute management of head injury. However, as in any clinical situation there may be factors which cannot be covered by a single set of guidelines. The document should be used as a guide, rather than as a complete authoritative statement of procedures to be followed in respect of each individual presentation. **It does not replace the need for the application of clinical judgement to each individual presentation.**

IMPLEMENTATION

Chief Executives must ensure:

- Local protocols are developed based on the *Initial Management of Closed Head Injury in Adults* clinical practice guideline.
- Local protocols are in place in all hospitals and facilities likely to be required to assess or manage patients with a closed head injury.
- Ensure that all staff treating patients with a head injury are educated in the use of the locally developed protocols.

Directors of Clinical Governance are required to inform relevant clinical staff treating patients of the revised protocols.

1. BACKGROUND

1.1 About this document

The NSW Institute of Trauma and Injury Management (ITIM) has updated the *Initial Management of Closed Head Injury in Adults* clinical practice guideline to reflect the latest evidence based practice for the management of adults with a closed head injury.

The guideline is intended for use by clinicians in all facilities which provide initial care to the mild, moderate and severely head injured patient. The practical evidence based recommendations are regarded as a safe and appropriate approach to the acute management of adults with closed head injury. However, as with any clinical guideline the document should be used as a guide, rather than as a complete authoritative statement of procedures.

Each LHD must have clear and readily available protocols incorporating the following principles.

1.2 Key definitions

Must – indicates a mandatory action that must be complied with.

Should – indicates a recommended action that should be followed unless there are sound clinical reasons for taking a different course of action.

Mild head injury – a patient with an initial GCS score of 14-15 on arrival at hospital following acute blunt head trauma with or without a definite history of loss of consciousness or post traumatic amnesia.

Moderate head injury – a patient with an initial GCS score of 9-13 on arrival at hospital following acute blunt head trauma.

Severe head injury – a patient with an initial GCS score of 3-8 on arrival at hospital following acute blunt head trauma.

Post traumatic amnesia – period of time during which a person is unable to lay down new memories following an injury.

Post concussion syndrome – a set of symptoms which are commonly experienced following blunt acute head trauma. The symptoms may include headaches; dizziness; fatigue; memory impairment; poor concentration; mood swings; behavioural changes; sleep disturbances and social dysfunction.

2. KEY PRINCIPLES

2.1 Mild closed head injury

Patients with mild closed head injury (initial Glasgow Coma Scale 14-15) should be risk stratified into high and low risk groups based on the presence or absence of specified clinical risk factors.

Patients with a mild head injury should be assessed by a process of structured clinical assessment involving a combination of :

- Initial clinical history and examination.
- Serial clinical observations.
- CT scanning if clinically assessed as being at increased risk of clinically significant lesions requiring acute neurosurgical intervention or prolonged observation in hospital.

Patients with persistent acute clinical symptoms (including post traumatic amnesia, disorientation, confusion, drowsiness, dizziness, nausea, vomiting, headache) at four hours post injury require prolonged clinical observation; and a CT scan should be performed (if not already done) to exclude a structural lesion.

Where CT scanning is unavailable patients with high risk mild head injury will require either admission for prolonged observation or early transfer of CT scanning depending on clinical assessment of risk.

If a patient with mild head injury deteriorates, the priorities are exclusion of other injuries, supportive care of the ABCDEs and early CT scan to identify a neurosurgically significant lesion. If a neurosurgically significant lesion is identified, further management should be discussed with a neurosurgical service.

Mild head injury patients can be safely discharged for home observation after an initial period of in-hospital observation if they meet specified clinical, social and discharge advice criteria.

All patients with mild head injury must be given both verbal and written discharge advice covering signs and symptoms of acute deterioration, when to seek urgent medical attention, lifestyle advice to assist recovery, information about typical post concussion symptoms and reasons for seeking further medical follow up.

2.2 Moderate head injury

Patients who present initially with moderate head injuries should all have an early CT scan and close clinical observation. They should be admitted to hospital for at least 24 hours observation unless they rapidly return to normal, have a normal CT scan and absence of other clinical risk factors.

The majority of patients who suffer moderate head injuries will have some degree of cognitive behavioural social sequelae and should be considered for routine follow up with a brain injury rehabilitation service or a neurologist.

2.3 Severe head injury

Resuscitation with adequate oxygenation and fluid resuscitation and the treatment of other immediately life threatening injuries should be the priority for patients with severe head injury followed by the CT identification of focal intracranial lesions requiring acute neurosurgical intervention. Early intubation to prevent hypoxaemia and facilitate management is recommended.

A neurosurgical service must be consulted about further management of patients with severe head injury as soon as practical after the initial primary survey and resuscitation.

Patients with closed head injury assessed at hospitals without CT scanning facilities should be transferred to the nearest appropriate hospital if there is significant risk of intracranial injury. Transfer of patients to a hospital with CT scanning facilities but without neurosurgical services should be avoided wherever possible.

2.4 Analgesia

Most headaches associated with isolated mild head injury will respond to simple analgesia such as paracetamol. If paracetamol is ineffective as a sole agent then stronger analgesia such a oral opioids or parenteral opioids should not be prescribed to patients with isolated mild head injury unless the need for an initial or repeat CT scan to exclude clinically important intracranial lesions has been considered and a senior clinician has been consulted.

Most moderate head injury patients and nearly all severe head injury patients will require titrated intravenous analgesia and sedation for associated injuries, clinical management or intubation. These patients will all require close clinical observation in a high dependency area following initial clinical assessment and CT scanning.

2.5 Anti-convulsants

Post traumatic seizures are a recognised complication of closed head injuries with incidence depending largely on severity of injury. Acute post traumatic seizures occurring in hospital require systematic reassessment of the ABCDEs to exclude systemic causes and termination with benzodiazepines if required. Underlying structural lesions should be excluded with CT scan and then the need for prophylactic anti-convulsants considered.

Prophylactic anti-convulsants are not indicated for patients with uncomplicated mild head injury. Prophylactic anti-convulsants, such as phenytoin, should be considered in patients with complicated mild head injury or moderate to severe head injury who have specific risk factors that put them at increased risk of seizures. Clinical judgement is required and neurosurgical consultation is advisable.

5. **Implementation Checklist**

NSW PAEDIATRIC CLINICAL CARE AND INTER-HOSPITAL TRANSFER ARRANGEMENTS (PD2023_019)

PD2023_019 replaced PD2005_157

POLICY STATEMENT

NSW Health is committed to providing the right care, in the right place, at the right time and as close to home as possible. Many infants, children and adolescents will be able to receive the clinical care they need at a local service. If their needs are outside a service's capability and capacity to deliver the required care, an inter-hospital transfer must be arranged.

SUMMARY OF POLICY REQUIREMENTS

To provide appropriate clinical care and inter-hospital transfers for paediatric patients, NSW Health services must operate at their designated service capability level within agreed local health service arrangements and in partnership with transport and retrieval services. NSW Health services may also have local arrangements in place for paediatric inter-hospital transfers with specialist health services and retrieval services in bordering jurisdictions.

NSW Health organisations are to develop local guidance in line with this Policy Directive. This guidance must outline local arrangements for services (including Multipurpose Services) to follow when accessing clinical consultation to support care delivered locally as well as care involving inter-hospital transfer. Inter-hospital transfer processes are to include escalation of care to higher-level services and return transfer close to home when medically appropriate.

All services must work together to provide a network of care for NSW paediatric patients. Within local arrangements, higher-level services are responsible for providing lower-level services with support, advice and management of paediatric patients, including patients requiring inter-hospital transfer.

As supra-Local Health District services, Level 5 and 6 neonatal and Level 6 paediatric services must provide services for paediatric patients located within NSW and the ACT.

When an inter-hospital transfer is being considered, clinical decision-making must primarily match the paediatric patient's condition to the most appropriate service and consider:

- service capability and capacity of referring and receiving services
- capability and capacity of transport and retrieval services
- providing care as close to home as possible
- child and adolescent and family needs and preferences
- logistics such as weather and modes of transport.

Transfer decisions are to be made through discussion between responsible clinicians at the referring and receiving services. The Newborn and paediatric Emergency Transport Service (NETS) must be involved when an immediate response for transfer is needed and when clinical escort decisions require additional specialist clinical advice. NETS will facilitate care plan decision-making for these transfers through hosting conference calls with all clinical decision-makers.

Retrieval teams are responsible for the clinical care of a patient from the time of handover from the referring treating team until the patient is handed over to the destination service.

If an infant, child or adolescent in a hospital close to the border with an adjoining state requires a cross-border inter-hospital transfer, NETS will arrange transport or retrieval via NETS or NSW Ambulance or request the relevant jurisdiction's retrieval service to respond.

If a bordering jurisdiction's retrieval team is conducting the transfer, NETS will maintain contact with the referring treating team and provide clinical leadership until NETS confirms that the bordering retrieval team has taken over direct patient care. On handover, governance of the transport process moves to the bordering jurisdiction's transport/ retrieval service.

Management of urgency and risk are shared responsibilities of all parties involved in the transfer.

When transfer to higher-level care is required, the patient is to be appropriately transported within the medically agreed time frame to the nearest service that can provide the needed care. Treating teams at higher-level services are responsible for accepting referrals or finding an appropriate alternative if they do not have capacity to provide the needed care.

For return transfers, destination planning (identification of most appropriate service and bed-finding) is led by referring services and must be assisted by higher-level services if required.

Local health districts and the Sydney Children's Hospitals Network will optimise access to appropriate care close to home through services operating at their designated service capability level and actively managing patient flow.
Infants, children, adolescents and their families/carers are to be provided with timely, culturally appropriate and accessible information about clinical care, decisions and the transfer process.

A family member/ carer must be supported to travel with their child during an inter-hospital transfer wherever possible and appropriate, in consultation with the transport/ retrieval service.

Infants, children, adolescents and their families/ carers are to be offered relevant services and supports including through Aboriginal health workers, Aboriginal Maternal and Infant Health Service (AMIHS) staff, interpreters, cultural and diversity supports, social workers and other services as required.

The NSW Paediatric Clinical Care and Inter-Hospital Transfer Arrangements policy is available at: https://www1.health.nsw.gov.au/pds/Pages/doc.aspx?dn=PD2023_019

DEPARTURE OF EMERGENCY DEPARTMENT PATIENTS (PD2014_025)

PD2014_025 rescinds PD2005_082.

PURPOSE

For the purpose of this policy, **'Departure from Emergency Department'** refers to patients leaving the Emergency Department (ED) whether they are to be discharged, admitted or transferred to another facility.

This policy outlines the principles for implementing a standardised approach to determining whether a patient is ready for departure from NSW EDs once the ED phase of their care is complete. These principles are to be implemented by NSW Public Health Organisations.

For information on patients awaiting care or commencement of clinical treatment please see **PD2013_047** ***'Triage of Patients in NSW Emergency Departments'*** and **PD2010_075** ***'Emergency Department Patients Awaiting Care'***.

MANDATORY REQUIREMENTS

All NSW Public Health Organisations must:

- Ensure that local processes are in place which comply with this policy and support the four principles of readiness for departure from ED described here.
- Confirm that processes are in place in each ED to ensure that all patients are ready for departure from ED upon completion of the ED phase of their treatment and have been authorised as ready to depart. Readiness for departure from ED encompasses the following four principles:
  - The patient is safe for departure from a clinical and functional perspective.
  - The patient has had appropriate risk assessments undertaken prior to departure.
  - Identified risks likely to impact on readiness for departure have been mitigated where appropriate and possible.
  - Communication with the patient (including family and carers where appropriate) about ongoing care requirements has occurred. Patients should be given post-discharge care instructions in plain language which is relevant to the individual and provides information that adequately describes follow up treatment. Communication must be undertaken with any relevant health professionals who will be involved in the ongoing care of the patient upon leaving the ED, particularly if there is a requirement for them to provide patient care or a request to follow up outstanding care requirements.
- Ensure all staff are aware of the 'Departure of Emergency Department Patients' policy and their responsibilities in relation to managing the departure from ED of patients.
- Ensure that the **Adult and Paediatric ED Observation charts** 'Departure and Discharge from ED' checklists are utilised to support implementation of this policy as per NSW Health policy **PD2013_049** ***'Recognition and Management of Patients who are Clinically Deteriorating'***. If the ED charts specifically are not used, that alternate local processes must be in place which demonstrate all information on the checklist being collected for patients.
- Ensure that local evaluation of compliance with this policy is undertaken. This should include internal review of incidents related to departure of patients from ED and review of consistency of use of the Adult and Paediatric ED Observation chart 'Departure and Discharge from ED' checklists (or equivalent local process).

IMPLEMENTATION

Local Health District and Specialty Health Network Chief Executives are responsible for:

- Assigning responsibility, personnel and resources to implement this policy.
- Establishing mechanisms to ensure that the mandatory requirements are applied, achieved and sustained as usual processes for departure of patients from ED; this should include nomination of an executive sponsor.
- Ensuring that any local policy reflects the requirements of this policy and is written in consultation with hospital executive, Clinical Governance Unit, ED senior management and other relevant staff.
- Ensuring that hospital and ED processes support the minimisation of delays for patients departing the ED, including limiting delays which may occur as a result of the requirement to complete the ED departure process.

a. BACKGROUND

1.1 About this document

For the purpose of this policy, 'Departure from Emergency Department' refers to patients leaving the Emergency Department whether it is to be discharged, admitted or transferred to another facility.

This policy directive and procedure replaces PD2005_082 *'Discharge Policy for Emergency Department at risk patients'*, which was developed in recognition that patients being discharged from Emergency Departments (ED) may be at risk of re-presentation or adverse events. The Special Commission of Inquiry, Acute Care Services in NSW Public Hospitals also recommended in 2008 that a checklist be implemented in NSW EDs to communicate the needs of a patient being admitted to an inpatient unit.

This policy and procedure seeks to encompass both of these elements by detailing a standardised approach for all patients who depart the ED. It describes the principles required to minimise the risk of adverse events for patients who have completed the ED phase of their treatment and have been authorised as ready to depart the ED.

In accordance with NSW Health policy **PD2013_049 *'Recognition and Management of Patients who are Clinically Deteriorating'*** this policy requires use of the NSW Health Standard Adult and Paediatric ED Observation Charts including the checklist for staff to complete for patients prior to leaving ED. If the charts are not used, alternative local processes must demonstrate that the information contained in the checklists is being collected.

This policy is also consistent with the Australian Charter of Healthcare Rights for patients described in NSW Health Policy **PD2011_022 *Your Health Rights and Responsibilities.***

1.2 Key definitions

At Risk	Refers to a patient who has been assessed as having an identified risk which is recognised to contribute to adverse events or readmissions upon leaving the ED.
Clinical Handover	The transfer of professional responsibility and accountability for some or all aspects of care for a patient, or group of patients, to another person or professional group on a temporary or permanent basis.
Emergency Department Departure	(ED Departure) refers to the transfer of responsibility and accountability for a patient's care upon leaving the ED. The patient may be admitted to an inpatient ward, be transferred to another facility or be discharged back to the community and their usual place of residence.
Left at Own Risk	Refers to any person who leaves the ED after treatment has commenced, against advice. The patient's health Care Record will reflect that the patient has been seen by Doctor/Nurse/Nurse Practitioner and will have a diagnosis.
Person Responsible	Refers to someone who has legal authority to make decisions on behalf of someone else who does not have the capacity to consent for themselves. A 'person responsible' is not necessarily the patient's next of kin. A 'person responsible' is either: • a **guardian** (including an enduring guardian) who has the function of consenting to medical, or dental treatment. or, if there is no guardian: • the most recent **spouse** or **de facto spouse** with whom the person has a close, continuing relationship. 'de facto spouse' includes same sex partners. or, if there is no spouse or de facto spouse: • an **unpaid carer** who is now providing support to the person or provided this support before the person entered residential care. or, if there is no carer: • a **relative** or **friend** who has a close personal relationship with the person. • The **NSW Civil & Administrative Tribunal**, **Guardianship Division** ***Note:*** *The above information has been provided by the NSW Civil & Administrative Tribunal,* ***Guardianship Division*** In accordance with **PD2005_406 *Consent to Medical Treatment – Patient Information*:** • A child aged 14 years and above may consent to their own treatment provided they adequately understand and appreciate the nature and consequences of the operation, procedure or treatment
Ready for Departure	Refers to a patient who has been authorised by senior ED staff as safe to depart the ED in accordance with the principles of this policy.
Risk Assessment	An activity that identifies risks, estimates their probability and the likely impact of their occurrence particularly in relation to adverse outcomes.

b. PROCEDURE FOR DETERMINING READINESS FOR DEPARTURE OF EMERGENCY DEPARTMENT PATIENTS

2.1 The four principles for determining readiness for departure of Emergency Department patients

Determination of a patient being ready for departure is a multidisciplinary process with ultimate responsibility resting with the senior ED medical officer and nurse in charge of shift of the ED or their delegates. Readiness for departure from ED encompasses the following principles:

1. The patient is safe for departure from a clinical and functional perspective.
2. The patient has had appropriate risk assessments undertaken prior to departure.

3. Identified risks likely to impact on readiness for departure have been mitigated where appropriate and possible.
4. Communication with the patient (including family and carers where appropriate) about ongoing care requirements has occurred; as well as communication with any relevant health professionals who will be involved in the ongoing care of the patient upon leaving the ED.

2.2.1 Clinically and functionally safe for departure

When deeming a patient clinically safe for departure the following aspects must be met:

- The patient will be 'between the flags' with respect to recorded observations or there will be documented alterations to calling criteria on the relevant NSW Standard Observation Chart where this is appropriate for the patient. Patients who are leaving the ED for higher level care (e.g. Intensive Care Unit) are often unstable and may not be 'between the flags' – this should not delay departure from ED.
- All appropriate diagnostic tests will be completed or there is a documented plan of who is responsible to follow up outstanding tests and results. A management plan is documented including a provisional or definitive diagnosis and this is communicated to relevant health professionals.
- The patient is departing for a location that has a level of supervision or clinical care consistent with their clinical condition and risk assessment.

2.1.2 Risk assessment

There are many health risk assessment tools and guidelines available to clinicians – not all are suitable to be undertaken in the ED. Appropriate risk assessment should be undertaken at the discretion of the treating clinician and according to patient clinical need and local procedures.

In addition to clinical risk identification; mental health, social and cultural aspects that are likely to impact on the patient's readiness for departure from the ED must be considered.

If a patient is determined to be at risk; documentation and a corresponding risk mitigation process should be enacted.

Possible risks include, but are not limited to:

- Level of supervision required for discharge.
- Availability and accessibility of competent supervision if required.
- Competency to access transport or the provision of own transport.
- Ability to comply with discharge instructions including access to other health providers e.g. GPs and pharmacies.
- Need for specialist care within an inpatient unit or the requirement for inter-hospital transfer.
- Patients with undifferentiated diagnoses.
- Evolving or rapidly progressing disease processes.
- Indication for additional resources including equipment and personnel that is not currently available.
- Unsafe home environment/circumstances e.g. departure of elderly patients to home at night, known domestic violence situations.
- Complex social situation/circumstances where significant allied health intervention is required e.g. **homelessness**.

2.1.3 Risk mitigation

Not all risks can be mitigated in the ED, however every effort should be made to identify and manage potential risks during assessment and treatment in the ED. Referral to appropriate services to manage identified risks should occur as early as possible, this may include Mental Health Services, Aboriginal Liaison Officers or Allied Health services.

Departure from the ED must not take place if significant risk has been identified and these risks cannot be managed after ED Departure, or if the patient requires the supervision of a responsible adult for appropriate ED Departure and this cannot be ensured. A local facility protocol should identify the process to be undertaken in this situation (e.g. transfer to inpatient unit if appropriate).

2.1.4 Communication of the Patient's care needs

The communication of information to patients, carers and other health professionals about the ongoing care needs of the patient is essential to ensuring continuity of care.

PD2009_060 *'Clinical Handover – Standard Key Principles'* clearly states the requirements for the transfer of information, accountability and responsibility for a patient or group of patients between clinicians. The elements relevant to the clinical handover should be addressed as per the Adult and Paediatric ED Observation charts 'Departure and Discharge from ED' checklists.

Patients departing the ED for inpatient wards
Patients departing the ED for inpatient wards should have a clinical handover process completed with the relevant ward staff which details the patient's plan of care and any outstanding tests and actions that require follow up.

Documentation is to be complete as per **PD2012_069 *Health Care Records - Documentation and Management*** as well as other relevant information to ensure ongoing care of the patient pending review of the inpatient team (e.g. interim orders for analgesia and other medications charted, progress notes completed).

Patients departing the ED for another facility
Patients departing ED for another facility must have communication managed as per **PD2011_031 *'Inter-facility Transfer Process for Adults Requiring Specialist Care'*** and **PD2010_031 *'Children and Adolescents – Inter-Facility Transfers'***

Communication for the Transfer of Critically ill patients is as per **PD2010_021 *'Critical Care Tertiary Referral Networks & Transfer of Care (Adults)'*** and **PD2010_030 *'Critical Care Tertiary Referral Networks (Paediatrics)'***

Patients departing the ED for home or usual place of residence
Patients departing the ED for home or their usual place of residence require adequate instruction to ensure the patient (and/or family/carer where appropriate) is aware of ongoing care requirements.

Not every patient requires a formally written discharge letter; however information should be given to the patient which adequately describes follow up treatment. This may be verbal instruction, patient fact sheets with information about their condition or details of who to call or follow up with regarding their treatment and any referrals made to other services.

The method of information given should be at the discretion of the treating clinician and take into account the patient's understanding of information and any cultural, language and social requirements to assist with understanding of information. Documentation in the patient's Health Care Record of the method used is appropriate, e.g. if verbal instruction only is given or a copy of the discharge letter.

Efforts should be made to contact Residential Aged Care Facility staff to notify them of the resident's return to the facility.

Discharge letter

If further care by another health professional is required, then a discharge letter is appropriate. The letter should include information about the ED treatment, details of test results carried out in the ED or results which require follow up, any changes to medications and any other relevant information required to ensure continuity of the patient's care. A copy of the letter should remain in the patient's Health Care Record.

Authorisation to depart ED

All patients leaving the ED require authorisation that they are ready to depart the ED. This is the responsibility of senior medical and nursing staff in the ED (or their delegate) and should be indicated on the Adult and Paediatric ED Observation charts 'Departure and Discharge from ED' checklists (or documented as per equivalent local process).

In EDs where there is no senior medical staff on site, delegation of authorisation to depart the ED will be according to locally agreed to and communicated processes.

c. PATIENTS WHO 'LEFT AT OWN RISK'

A competent adult patient has the right to refuse medical treatment for themselves or their children/dependents. A person is incapable of giving consent if they are not "competent'. There is no single legal test or definition of competency. However, in order to be competent to consent to or refuse treatment, a patient must be able to comprehend and retain treatment information and consider the information in order to reach a decision.

The **Guardianship Act 1987** provides methods for obtaining consent to treat those persons who are incapable of giving consent. A designated Person Responsible may substitute if the patient is unable to given consent.

All reasonable measures must be undertaken to manage the patient who expresses the wish to leave the ED against medical advice.

This includes ensuring the patient:

- Is counselled by appropriate staff against leaving against medical advice. All attempts to convince the patient to stay should be documented in the patient's Health Care Record.
- Has had the potential consequences of leaving the ED explained in plain language which is relevant to the individual (by the senior doctor/nursing staff or their delegate) including the use of interpreters/Aboriginal Liaison Officer if necessary. This must be explicitly documented in the patient's Health Care Record.
- Is competent to make the decision to leave.
- Is given advice on follow up options.
- Is given the option to return.
- Is encouraged to call to inform a friend or relative, or allow the ED staff to do so where appropriate.
- If appropriate has consulted with an Aboriginal Liaison Officer to ensure culturally appropriate treatment options.

Should a patient be found to have left the ED without the knowledge of staff and there are concerns for the patient's or other's safety, actions taken will be in consideration of both the patient's level of competence to make the decision as well as the risk (clinical or otherwise) to the patient/others.

Section 2.5.2 of **PD2012_060 *Transfer of Care from Mental Health Inpatient Services*** provides specific detail on Procedures for locating missing patients which can be applied to the ED setting, particularly for patients being detained under the *Mental Health Act 2007*.

NSW CRITICAL CARE TERTIARY REFERRAL NETWORKS & TRANSFER OF CARE (ADULTS) (PD2018_011)

PD2018_011 rescinds PD2010_021.

PURPOSE

This Policy Directive refers to critically ill or injured adult patients and those **at risk of critical deterioration** requiring referral and transfer of care to a higher level facility.

The policy defines the links between Local Health Districts (LHDs) and tertiary referral hospitals and takes into account established functional clinical referral relationships.

The policy outlines the roles of state clinical specialty referral networks that operate in conjunction with the NSW Critical Care Tertiary Referral Networks (Section 10). It describes the process for time urgent and non-time urgent patients, referral process for retrieval services, the default adult intensive care unit (ICU) bed policy and the requirement for LHD escalation processes.

MANDATORY REQUIREMENTS

- Access to emergency care and/or surgical intervention for time urgent critically ill or injured patients must not be delayed due to “no-available” ICU or specialty bed e.g. burns, cardiac or spinal. Should this situation arise Aeromedical Control Centre (ACC) is to be contacted immediately.
- Requirements for transfer of critically ill obese patients outlined in Section 6 must be applied.
- Each LHD must have documented and implemented escalation plans to ensure the appropriate accommodation of critically ill or injured patients. This should include procedures for clinicians to obtain timely clinical advice and/or support to expedite the review and referral of non-time urgent critical patients (Section 8). Escalation plans must also include procedures for clinicians to follow in instances where an appropriate bed is not available within the network or difficulties are experienced with patient acceptance and placement.
- Every hospital is linked to a designated tertiary referral hospital which is networked to a group of referring hospitals to provide critical care for their patients. In situations where no adult intensive care beds are available across NSW, the default adult ICU bed policy may be invoked (Section 12). When the default policy is invoked the designated tertiary hospital is responsible for providing critical care, irrespective of bed status, to a specified group of referral hospitals. This responsibility includes assisting with patient placement to an appropriate alternative location for treatment and care.
- In time urgent situations the ACC has the authority to transport the patient directly to the designated tertiary hospital regardless of available bed state. If there is a closer hospital that can provide the time urgent treatment required, ACC may elect to transport the patient there. This may include referral across LHD boundaries. In each case the ACC Consultant must notify the receivingclinician.

IMPLEMENTATION

Local Health District Chief Executives are responsible for:

- Ensuring implementation of the policy directive and the delegation of a single point of arbitration and decision making to ensure clinically appropriate transfers in appropriate timeframes.
- Meeting the critical care and intensive care needs of that LHD and linked rural LHD, where specified. This includes the provision of clinical advice and ensuring access to appropriate treatment.
- Ensuring clinical advice and/or support, escalation and referral procedures are documented and implemented to ensure access to definitive care in an appropriate timeframe. 298(28/03/18)

- Ensuring that all options for placement of the critically ill patient within the originating LHD have been explored. This includes appropriate transfers from ICUs within the LHD to inpatient areas to create capacity.
- Ensuring the continued effective operation of the NSW Critical Care Tertiary Referral Network.
- Ensuring formalised intra and inter-LHD referral and/or cross jurisdictional arrangements exist for critically ill or injured patients needing a higher level of definitive care and include ongoing formal communication with review and feedback.
- Engaging relevant clinicians and ensuring that consistent local protocols or operating procedures are developed and distributed to relevant clinical areas.
- Ensuring that compliance with this policy is audited and regularly monitored in collaboration with intra and inter-LHD stakeholders.

Intensive Care Units are responsible for:
- Ensuring the information in the Critical Care Resource management System (CCRS) or Patient Flow Portal (PFP) is current and correct at each shift handover.
- Bed finding for non-time urgent critically ill or injured patients

Patient Flow Units/Bed/ After Hours Managers are responsible for**:**
- Facilitating referrals for all non-time urgent critically ill patients.

The NSW Aeromedical Control Centre (ACC) (**1800 650 004)** is responsible for:
- Coordination of adult medical retrieval for time urgent critically ill patients in collaboration with the Regional Retrieval Services across NSW.

1 Background

1.1 About this document

This policy directive provides guidance on the appropriate process for referring and transferring critically ill or injured adult patients to a higher level facility for definitive care.

Patients who are critically ill, injured or at risk of critical deterioration need appropriate access to critical care resources. In order to achieve safe, timely and efficient transfer of these patients to a higher level facility a streamlined process must exist. This document aims to support a seamless and integrated network of critical care services to best meet the needs of patients.

State clinical specialty referral networks operate in conjunction with the critical care networks.

These networks assist in ensuring appropriate and timely patient referral and transfer. Once critical care resources are no longer required by the patient a similarly efficient return transfer to the originating hospital is essential.

The Critical Care Resource management System (CCRS) provides information about available adult critical care beds across NSW. CCRS should be used to inform coordination and placement of critically ill patients to the appropriate higher level facility.

The Aeromedical Control Centre (ACC) is responsible for the statewide coordination of adult medical retrieval services for time urgent critically ill or injured patients in collaboration with the Regional Retrieval Services. The ACC is the central point of contact for the medical retrieval of all time urgent critically ill or injured adult patients.

298(28/03/18)

Each Local Health District (LHD) is responsible for ensuring that escalation plans are in place to ensure clinicians can obtain timely clinical advice and/or support to expedite the review, referral and

appropriate placement of critically ill or injured patients. This must include procedures for clinicians to follow for referral of non-time urgent critically ill patients in situations where there are no appropriate beds and negotiation with the receiving hospital is required (Appendix 2).

Implementation of local models, such as the Greater Western Critical Care Advisory Service (CCAS), should be considered to provide critical care specialist advice and support when required.

This policy does not include referral of paediatric, neonatal, obstetric or patients requiring specialist care and does not override referral networks established within the following policy directives:

- Critical Care Tertiary Referral Networks (Paediatrics) PD 2010_030 1
- Critical Care Tertiary Referral Networks (Perinatal) PD 2010_069 2
- Inter-facility Transfer Process for Adults Requiring Specialist Care PD2011_0315

Table 1 provides a summary of the referral process, contact pathways and responsibilities for time urgent and non-time urgent critically ill patients.

Table 1: Referral Process Summary

Referral Process Summary					
Clinical Condition	**Urgency of Transfer**	**Contact**	**Bed finding responsibility**	**Initiating Transport**	**Transfer to**
Critically ill or injured	**Time urgent** Fastest response and or transport by appropriate team (often medical retrieval team)	ACC [1] Advice for stabilisation and transfer	ACC[1] Patient automatically transported to nearest hospital that can provide definitive care without delay Hospital acceptance or available bed is desirable but not mandatory NB: Communication **must** occur with the receiving hospital prior to transfer	ACC [1]	Linked Tertiary Hospital
	Non-time urgent Response and or transport by appropriate team within appropriate timeframe (often medical retrieval team)	Linked Tertiary Hospital for ICU advice	Linked Tertiary Hospital using CCRS[2]/PFP and PFU[3]/hospital bed manager	Referring clinician contact ACC[1]	Linked Tertiary Hospital
Require Specialist Care	Refer to Inter-facility Transfer Process for Adults Requiring Specialist Care PD2011_0315				

1 Aeromedical Control Centre (ACC) 1800 650 004
2 Critical Care Resource management System (CCRS) http://ccrs.health.nsw.gov.au
3 Patient Flow Unit (PFU) and Hospital Bed managers cannot refuse transfer of time urgent critically ill patients

Key definitions

Aeromedical Control Centre (ACC): A NSW Ambulance unit providing clinical support and advice, transport and escort services for critically ill or injured patients requiring medical retrieval.

Conference call: "One phone call" referral where possible to connect the referring clinician, medical retrieval consultant and receiving clinician.

Critical Care Resource management System (CCRS): provides information about available adult critical care beds across NSW to inform coordination and placement of critically ill patients to the appropriate level of definitive care.

Critically ill/injured: A patient whose illness, injuries or physiologic instability constitutes a significant and imminent threat to their life without appropriate resuscitation and support. Patients may be classified as:

- **Time urgent:** Requiring emergency care at the closest appropriate hospital in the shortest time possible to achieve early intervention and stabilisation.
- **Non-time urgent:** Stabilised requiring transfer for a higher level of definitive critical care or clinical specialty, but whose transfer is not time-urgent.

Patient at risk of critical deterioration: A patient who has suffered a significant injury or illness who may appear to be stable but whose condition may quickly deteriorate requiring constant monitoring and early transfer for definitive critical care.

Non-critical patient requiring specialist definitive care: A patient requiring referral and transfer for specialist care facilitated by the LHD Patient Flow Unit in consultation with the patient's clinical management team.

Escalation process: Defined procedure for escalation for decision making, when an issue regarding patient transfer arises which will impact on the patient accessing safe and timely care within the medically agreed timeframe.

Major Trauma Service (MTS): Can provide the full spectrum of care for major and moderately injured trauma patients.

Neonatal and paediatric Emergency Transport Service (NETS): A medical retrieval service for babies and children who require intensive care.

Patient Flow Portal (PFP): Electronic system which aims to improve patient flow within a ward, hospital or LHD.

Patient Flow Unit (PFU): Responsible for managing patient flow within a given facility or LHD. In rural areas this may be a bed or after hours manager.

Primary Retrieval: A patient transferred directly from the scene of an incident or medical emergency to hospital.

Regional Trauma Service (RTS): Can provide all aspects of care to patients with moderate to minor trauma, and definitive care to a limited number of major trauma patients in collaboration with the MTS

.**Secondary Retrieval:** A patient transferred between health facilities.

298(28/03/18)

2 NSW Critical Care Tertiary Referral Networks (Adults)

The NSW adult Critical Care Tertiary Referral Networks define the links between LHDs and tertiary referral hospitals. The networks take into account established clinical referral relationships which may include referral patterns across LHD boundaries and cross jurisdictional border arrangements. In

addition, some ICUs may have functional links with a higher level ICU in a networked approach to provide access to senior critical care advice under the Intensive Care Service Model.3

It is not the intention of this policy directive to specify each individual hospital's referral pathways. The referral pathways defined within this document are the established links and the **default** patterns to be used when the default adult ICU bed policy is invoked (Section 12).

Operating in conjunction with the critical care referral networks are state clinical specialty referral networks, which are also defined within this Policy Directive. These referral networks and processes are in place to assist clinicians and Patient Flow Units (PFU) to ensure appropriate and timely referrals. These include:

- NSW Burn Injury Service (Adult)
- NSW Acute Spinal Cord Injury Service (Adult)
- NSW Major Trauma Referrals (Adult)
- NSW Rural Cardiac Catheterisation Services (Adult)
- NSW Extra Corporeal Membrane Oxygenation (ECMO) MedicalRetrieval

Table 2 outlines the Critical Care Tertiary Referral Networks for critically ill adult patients requiring transfer to a tertiary facility. These are also the default network for private hospitals within LHDs. Due to proximity some LHDs may also have cross jurisdictional border networks with tertiary critical care services in other states and territories, as outlined below.

Table 2: NSW Adult Critical Care Tertiary Referral Network

Referring LHD	Receiving Tertiary Hospital
Central Coast	Royal North Shore
Far West	Royal Prince Alfred, South Australia (Adelaide)1
Hunter New England	John Hunter
Illawarra Shoalhaven	St George
Mid North Coast	John Hunter, Queensland3
Murrumbidgee	ACT2 (Canberra), Prince of Wales, St George, St Vincent's, Victoria (Mlb)4
Nepean Blue Mountains	Nepean
Northern NSW	John Hunter, Queensland3
Northern Sydney	Royal North Shore
South Eastern Sydney	Prince of Wales, St George
South Western Sydney	Liverpool
Southern NSW	ACT (Canberra)2, Prince of Wales, St George
Sydney	Royal Prince Alfred
Western NSW	Royal Prince Alfred
Western Sydney	Westmead
Due to proximity some LHDs and facilities also maintain clinical referral networks as follows: • Far West: South Australia1. • Murrumbidgee: ACT 2 (Batlow, Boorowa, Murrumbarrah-Harden, Tumut, Young), Victoria 4 (Albury) • Mid North Coast: Queensland 3. • Northern NSW: Queensland 3 (Tweed) • Southern NSW: ACT2 (Bateman's Bay, Bombala, Boorowa, Braidwood, Crookwell, Cooma, Delegate, Goulburn, Moruya, Pambula, Queanbeyan South East Regional (Bega) and Yass)	

3 **Which Adults May Need Medical Retrieval?**

Patients with actual *or* ***potential*** **significant illness or injuries who are at risk of critical deterioration** and **may** require retrieval in the event that the originating hospital is unable to safely continue care include:

Airway
- All intubated patients
- Patients potentially requiring airway intervention enroute (threatened airway obstruction, altered or decreasing LOC, head/neck trauma, head/neck / inhalation burns)

Breathing
- Significant respiratory distress or compromise after treatment
- RR < 8 or >30, SpO2 < 90% on 15L oxygen
- Pa02 <60 or PaC02 >60 or pH < 7.2 or BE <-5
- Respiratory dependency on NIV

Circulation
- Circulatory shock of any cause
- Heart rate < 40 or > 140 beats per minute with compromise
- SBP ≤ 90mmHg
- Complex or recurrent arrhythmias with compromise (e.g. recurrent VF, sustained VT, CHB)
- Ongoing significant bleeding

Disability
- Significant altered LOC - GCS ≤ 13
- Significant head injury
- Severe burns
- Acute spinal cord injuries
- Recurrent or prolonged seizures
- Intracerebral bleeding

Other
- Acute life-threatening electrolyte abnormality

Note: This list does not necessarily indicate time urgent, but is a list of patients who may need physician-escorted retrieval

4 NSW Aeromedical Control Centre (ACC)

The Aeromedical Control Centre (ACC) is a unit of NSW Ambulance which provides statewide 24-hour coordination and support:

- For **time urgent** critically ill or injured patients, the ACC will provide critical care clinical advice from a critical care consultant, location of and referral to an appropriate receiving hospital and mobilise a medical retrieval team (Section 7).
- For non-time urgent critically ill or injured patients, the ACC will organise and mobilise an appropriate clinical team (usually physician escort) (Section 8).
- The ACC will coordinate and mobilise an appropriate medical retrieval team for all medical retrievals (from both public and private facilities, to public facilities).
- Where possible; the ACC will coordinate a one phone call referral via conference call to connect the referring clinician, retrieval consultant and receiving clinician. The
- ACC and regional Ambulance Control Centres monitor all 000 calls for mechanisms and injuries suggestive of severe trauma, and dispatch appropriate retrieval teams (usually Doctor/paramedic) where indicated.
- The medical retrieval team can provide a variety of interventions including; advanced airway management, chest trauma management, advanced vascular access, transfusions, compression of bleeding sites and some time urgent surgical procedures where no viable alternative exists.

The ACC is **not** responsible for coordinating the transfer of non-critically ill patients. These patients must be managed by the LHD as per Section 9.

5. Key Elements of the Medical Retrieval System

- The ACC provides statewide coordination of adult medical retrieval services, in collaboration with the regional retrieval services.
- Retrievals may be undertaken by road, fixed wing aircraft or helicopter. Vehicle choice is based on the clinical urgency, transport requirements, optimum transport team, vehicle utilisation and available resources.
- All retrieval services can transport critically ill or injured patients by road ambulance using appropriate advanced medical equipment and clinical staff. An overview of adult retrieval services can be found at Table 3.
- Fixed wing aircraft and helicopters are not capable of safe flight in adverse weather conditions. The ACC uses a protocol to balance clinical priority and aviation risk. Factors such as fatigue, darkness and cold temperatures (fog, icing) increase aviation risk. Therefore, non-urgent transfers are not usually undertaken between midnight and 0700hrs.
- Aviation factors may influence the destination hospital and in some cases alternatives such as long road transfers, with or without an appropriate medical retrieval team, may be necessary.
- Critically ill or injured patients must be transferred to the nearest (in-time) designated appropriate facility (e.g. Major Trauma Service), irrespective of ICU bed status, so that emergency stabilisation and treatment can commence with minimal delay.
- In some cases, the referring clinician, retrieval consultant and receiving clinician may decide to refer a patient to a different hospital which is considered more clinically appropriate for that patient’s definitivecare.
- Ultimate responsibility for vehicle and team choice rests with the ACC retrieval consultant, with input from relevant stakeholders. Where there is a difference in clinical opinion regarding the appropriateness of the transfer, the final decision will be made by the ACC. This will follow a conference call between the referring clinician, retrieval consultant and receiving clinician, as per retrieval resources (Appendices 5-7).

Table 3: Overview of adult aeromedical retrieval services

Overview of adult medical retrieval services							
Aircraft	Location	Uses	Number of aircraft	Patient capacity	Bariatric capacity Max	IABP transfers	ECMO transfers
Fixed Wing	**Broken Hill** (Royal Flying Doctor Service)	Inter hospital transfer Primary mission Outreach clinic service	1	1 -2	230kg	Fixed wing and helicopters are capable of IABP and ECMO transfer Originate from Sydney and require specialist medical staff and equipment	
	Dubbo (Royal Flying Doctor Service)	Inter hospital transfer	1	1 -2			
	Sydney (Bankstown)	Inter hospital transfer	4	1 -2			
Helicopter	**Sydney** (Bankstown)	Primary mission	3	1 critically ill 2 in some cases	130kg* / 200kg		
	Lismore	Retrieval	1				
	Tamworth		1				
	Newcastle (JHH)	Search & rescue	1				
	Orange	Water Rescue	1				
	Wollongong		1				
	Canberra		1				

* Standard helicopter stretcher capacity is 130kg. Patients exceeding this need a 200kg stretcher and the ACC must be advised of this need in advance. Other requirements outlined in section 6 must also be met.

6. Obese Patients

The transfer of critically ill or injured obese patients can be clinically and logistically challenging. Different vehicles and stretchers are used to transport obese patients and limitations in weight capacity need to be considered including:

- The weight the stretcher, loading and securing mechanisms, and vehicle floor can support
- The stretcher width and whether the patient can physically fit and be restrained safely.

The transfer of obese patients by any vehicle is usually much slower than normal transfers. Occasionally the retrieval may occur in two separate stages; with rapid dispatch of clinical retrieval staff to aid in resuscitation the first step, followed by transport to definitive care.

Prior to commencing retrieval of any patient above 110kg, an **accurate** weight and maximum measured width must be determined, as per Bariatric Sizing Chart (Appendix 5). **Hospitals must ensure they can weigh patients**, as an estimate is unacceptable and may result in delays as alternative vehicles, stretchers and restraint systems are sourced.

In addition to the patient's weight and measurement, any logistical issues and resource requirements such as sufficient personnel, equipment and facilities to transport the patient to and into the vehicle must be considered, as per Table 4. Lack of resources may delay or negate the possibility of transfer or necessitate road transfer irrespective of distance.

At the time of retrieval request, the above information must be communicated to the ACC to help determine the most appropriate mode of transport.

The NSW Health Guideline GL2005_070 "*Occupational Health & Safety Issues Associated with Management of Bariatric (Severely Obese) Patients"* 4 should be referred to for the management of obese patients.

Table 4: Retrieval transport modes and resource considerations

Vehicle type	Road	Road Multi Purpose Vehicles (MPVs)	Fixed wing	Helicopter
Maximum weight	200kg	Any weight and size	230kg	130kg - normal stretcher 230kg - bariatric stretcher (must be added **before** leaving base)
Considerations	Patient width	Limited number of vehicles May not be available in suitable timeframe, depending on patient location	Can road legs to / from airports accommodate patient weight	Onsite concrete helipad Flat paved pathways into/out of hospital
Resources	Sufficient personnel Equipment and facilities to transport patient to and into vehicle: • Manual handling aides • Height adjustable trolley (as per below)			
Hospital trolley	Minimum safe working load	300kg		
	Height adjustable	660mm to 1020mm above ground level		
	Patient platform length	2 metres- with no raised edging at one end		
	Patient platform width	700mm		
	Patient platform surface	Smooth with raised edges on both sides and one end		
	Patient restraint system	Must have		
	Large wheels	Suitable for manoeuvring from hospital to helipad		
Bariatric chart	Complete and return to ACC as soon as possible			
Contact ACC	Provide weight, measurement and logistical considerations as soon as possible to inform transport mode			

[1] Standard helicopter stretcher capacity is 130kg. Patients exceeding this need a 200kg stretcher and the ACC must be advised of this in advance.

7. Time Urgent Patients Requiring Critical Care Referral

The ACC should be the first point of contact for all time-urgent critically ill or injured patient referrals, as per Appendix 1. PFUs should **not** be the first point of contact.

The ACC will provide critical care clinical advice, referral to the appropriate linked tertiary hospital consultant, bed finding and patient transfer for **time urgent** critically ill or injured patients from public and private facilities to public facilities.

Some examples of time-urgent patients include; traumatic head injury requiring urgent craniotomy, exsanguinating multi trauma patient, STEMI with cardiogenic shock, severe burns, acute spinal cord injury with motor sensory level and uncontrolled bleeding with ongoing shock after resuscitation from gastrointestinal or obstetric blood loss.

All time urgent transfers must be discussed with a retrieval consultant, even if the referring clinician believes a medical retrieval will not be the best option for the patient. There are added risks involved with transferring patients between hospitals without appropriately trained staff and properly secured medical equipment. If it is agreed that another option such as road ambulance transfer, with or without nurse or local doctor escort, is best, the retrieval consultant can organise an expedited ambulance response.

The referral process for **time urgent** critically ill or injured patients is:

- Referring clinician to contact ACC and, where possible, a conference call will be established; between the referring clinician, retrieval consultant and receiving clinician at the linked tertiary hospital.
- If a closer hospital can provide the time urgent treatment, the ACC may elect to transport the patient there. In each case the retrieval consultant will notify the receiving clinician.
- Clinical and logistical advice will be provided to the referring clinician to support the stabilisation and resuscitation of the patient.
- The timing of transfer will be triaged and coordinated by the ACC within the context of competing priorities.
- The ACC is responsible for providing timely updates to the referring clinician on dispatch and estimated time of arrival of the medical retrieval team.
- The referring clinician is responsible for ensuring:
  - Specific information regarding the patient's clinical status, management and any special considerations such as weight or logistical issues are provided to the ACC.
  - Timely updates of any significant changes in the patient's condition are provided to the ACC.

- The referring and receiving hospitals are responsible for notifying their PFU/hospital bed or after hour's managers of the impending transfer. However, PFU/ hospital bed or after hours managers **cannot** refuse transfer of time urgent critically ill or injured patients.

The ACC can be contacted on: 1800 650 004.
Retrieval resources including the bariatric sizing chart as per Appendices 5-8.

8 Non-Time Urgent Patients Requiring Critical Care Referral

The LHD is responsible for providing 24/7 mechanisms for critical care clinical advice, location of an appropriate receiving hospital and bed (which may be outside the LHD). Established LHD processes are usually via a critical care consultant attached to the linked tertiary hospital or PFU and the Critical Care Resource management System.

The ACC retrieval consultant is available to supplement clinical advice and task an appropriate clinical team to effect the transfer.

Some examples of non-time urgent patients include; ventilated and stable drug overdose, patients ventilated for respiratory failure who do not require an urgent life-saving procedure, stable ventilated multi trauma patients that have been appropriately imaged and do not require urgent surgery or intervention.

The ACC should be contacted as soon as possible and advised of the impending retrieval as outlined in Appendix 1. However, the role of ACC does **not** extend to locating beds or facilitating clinical referral for critically ill or injured patients who are **non-time urgent**. This remains the responsibility of the LHD, regardless of whether the linked tertiary hospital or LHD can provide an appropriate bed themselves.
Communication must occur with the receiving hospital prior to transfer. Once the patient has been accepted at the receiving hospital then ACC should be contacted to undertake the retrieval.

The referral process for **non-time urgent** critically ill or injured patients is:

- Referring clinician to contact their LHD's nominated central point for critical care advice such as the CCAS model with PFU attached medical officer, or linked tertiary referral hospital
- Clinical discussion to occur between referring clinician and LHD central point to determine clinical transfer priority, facilitate conference call with appropriate receiving consultant, facilitate transfer and assist with bed location as required
- Referring clinician/LHD central point to contact ACC to initiate transport and, where possible, a conference call will be established; between the referring clinician, retrieval consultant and receiving clinician
- The timing of transfer will be triaged and coordinated by the ACC and communicated within the context of competing priorities
- The referring clinician/LHD central point is responsible for ensuring communication of all relevant information to the ACC, as per Section 7
- The referring and receiving hospitals are responsible for notifying their PFU/hospital bed or after hour's managers of impending transfers.

9 Non-Critical Patients Requiring Referral for Specialist Care (Adults)

The role of ACC does **not** extend to locating beds or facilitating clinical referral for non-critical patients requiring specialist care.
Some examples of these patient types include; physiologically stable STEMI and conscious FAST-positive stroke patients requiring consideration of thrombolysis or neurointervention. All transfers must occur as per "Inter-facility Transfer Process for Adults Requiring Specialist Care" PD2011_031.

The volume of referrals and multitude of clinical referral networks for non-critical patients necessitates a decentralised model. However, it is recognised that in some cases, unless the referral and transfer is timely, the situation may become critical.

Each LHD has intra and inter LHD clinical networks for non-critical patients requiring referral for a higher level of specialist care. Formalisation of these networks and an "escalation of care" process

must be in place to ensure patients who require specialist referral are afforded timely access to definitive care.

PFUs/hospital bed or after hours managers support these established networks and facilitate non-critical referrals for patients requiring a higher and/or more specialised level of definitive care. All non-critically ill patients who require time urgent treatment and inter facility referral and transfer for specialist care should be facilitated through the LHD PFU/hospital bed or after hours manager, LHD transport services and if needed NSW Ambulance.

10 Critical Care Resource Management System(CCRS)

Currently the CCRS provides information about available adult critical care beds across NSW. There are plans to include this functionality into the PFP, however until this time CCRS should be used to inform coordination and placement of critically ill patients.

The web based CCRS receives automated data feeds from the Patient Flow Portal (PFP) every fifteen minutes via the LHD Patient Administration Systems (PAS) to inform ICU bed status. Manual updates are also required in real time to ensure that information is accurate and reflective of issues which can affect bed availability, such as staff availability. CCRS can be accessed via **http://ccrs.health.nsw.gov.au**.

The aim of CCRS is to improve access to adult intensive care beds for critically ill patients across NSW. Where appropriate, regional critical care services should be considered as potential sites to refer critically ill patients to improve overall access to intensive care beds. Statewide networking increases the number of patients able to be managed in regional centres and cared for closer to their home and family.

The linked tertiary hospital is responsible for bed finding using CCRS. If the patient has a time urgent critical condition needing transfer in the shortest time possible ACC should be contacted as per Section 7.

Each ICU is responsible for ensuring the information in CCRS is correct and current. Each ICU is required to check and verify the unit bed status at each nursing shift handover.

11 Statewide Clinical Specialty Referral Networks

Operating in conjunction with the adult critical care referral networks are the state adult clinical specialty networks. These networks are designed to achieve appropriate concentration of highly specialised services which can respond to the needs of NSW residents.

These specialty networks are outlined in Sections 11.1-11.6 and include:

- Burns
- Spinal
- Trauma
- Cardiac Catheterisation
- Extra Corporeal Membrane Oxygenation (ECMO)

Note should be taken of the most appropriate referral facility and the ability to take combined injuries such as burns, spinal and trauma if needed.

11.1 NSW Severe Burn Injury Service Referral Network (Adult)

The NSW Adult Statewide Severe Burn Injury Service is located at Concord Repatriation General Hospital and Royal North Shore Hospital. Patients may be retrieved to either one of these, except in the following circumstances where patients should be transported directly to Royal North Shore Hospital:

- Adult with burn injury and actual or suspected severe trauma
- Adult with burn injury and acute spinal cord injury
- Adult with burn injury during 2nd and 3rd trimester pregnancy.

Patients with severe burn injury should be referred according to the "NSW Burn Transfer Guidelines NSW Burn Injury Service"6, available at: https://www.aci.health.nsw.gov.au/resources/burn-injury.

The Severe Burn Injury Service Referral Network defines specialist burn injury services for severe burns and networked LHDs.

Table 5: NSW State Burn Injury Service Referral Network (Adult)

Due to proximity some LHD and hospitals may maintain specialty referral networks interstate; **Adult Retrievals: Contact ACC 1800 650 004**

11.2 NSW State Spinal Cord Injury Referral Network (Adult)

The NSW Adult State Spinal Cord Injury Service (SSCIS) is located at Prince of Wales Hospital and Royal North Shore Hospital. Patients may be retrieved to either one of these, except patients who have combined severe trauma and acute spinal injury should be transported directly to Royal North Shore Hospital, if clinically appropriate

The SSCIS is responsible for the management of patients who have sustained an acute spinal cord injury where there is persistent neurological deficit arising from damage to neural tissue as a result of trauma, or a non-progressive disease process (e.g. transverse myelitis, vascular occlusion, compression by infective process or haemorrhage).

Trauma patients who have sustained a spinal injury with neurological deficit must be transferred to a SSCIS as soon as medically stable. The relevant SSCIS should be notified immediately in all cases where a spinal cord injury has been sustained to facilitate referral and transfer as soon as possible, and to obtain clinical management advice.

This referral process only relates to acute spinal cord injuries with neural loss and those spinal cord injuries as defined by the SSCIS. Patients with vertebral fractures only, are to be referred to a Spinal/Orthopaedic or Neurosurgeon via the existing specialist trauma referral process for each LHD.

The State Spinal Cord Injury Referral Network defines specialist spinal services for acute spinal cord injuries and networked LHDs.

Table 6: NSW State Spinal Cord Injury Service (SSCIS) Referral Network (Adults)

Due to proximity some LHD/ hospitals may maintain specialty referral networks interstate.; **Adult Retrievals: Contact ACC 1800 650 004**

11.3 NSW Major Trauma Referral Networks (Adult)

The NSW adult trauma services provide expert multidisciplinary care for injured patients. The referral network for NSW trauma patients includes Regional Trauma Services (RTS) and Major Trauma Services (MTS). For patients with time urgent critical injuries, the first call should be to the ACC.

The trauma response begins with early identification of actual or potential severely injured patients by paramedics on scene or by hospital clinical staff. Transfer notification for major trauma patients should occur concurrently with treatment and imaging, and should not be delayed for want of a definitive diagnosis.

When an injured patient is initially managed at a local hospital, the hospital should expedite consultation and transfer to the networked RTS or MTS, as per trauma guidelines7.

RTS can provide all aspects of care to moderate - minor trauma patients and definitive care to a limited number of major trauma patients, in consultation with the networked MTS. This may include transfer to a MTS for services not available at the RTS.

The MTS can provide the full spectrum of care to major - moderately injured patients.

Patients with major trauma injury should be referred according to the “NSW Major Trauma Retrieval & Transfers Consensus Guidelines - NSW Institute of Trauma and Injury Management (ITIM)”, available at: **https://www.aci.health.nsw.gov.au/get-involved/institute-of-trauma-and-injury-management/clinical/trauma-guidelines/Guidelines**

All time urgent critically injured trauma patients must be transferred directly to the networked designated trauma service that can provide the required time urgent treatment (usually damage control surgery) prior to subsequent transfer. The ACC or regional retrieval consultant will make this decision in consultation with the referring hospital, retrieval team and receiving hospital.

If clinically appropriate, the following groups of trauma patients should be transferred directly as follows:

- **Isolated injury - acute spinal cord injury or burn injury** - to relevant service (see 11.1-11.2)
- **Combined injury** - acute spinal cord injury or burn injury and severe trauma - to Royal North Shore Hospital

All non-time urgent major trauma patients should be transferred to the nearest appropriate trauma service which may be either an RTS or MTS.

The NSW Trauma Services Referral Network defines specialist trauma services for trauma injuries and networked LHD’s.

Table 7: NSW Trauma Services Referral Networks (Adult)

NSW Trauma Services Referral Networks (Adult)		
Referring Local Health District	Regional Trauma Service	Major Trauma Service
Central Coast Northern Sydney	Gosford	Royal North Shore
Far west[4] Nepean Western NSW Western Sydney	Nepean Orange	Westmead
Hunter New England Mid North Coast Northern NSW[1]	Coffs Harbour Lismore[1] Port Macquarie Tamworth Tweed[1]	John Hunter
Illawarra Shoalhaven Murrumbidgee[2&3] South Eastern Southern NSW[3]	Wollongong Wagga	St George Australian Capital Territory
South Western Sydney	NA	Liverpool
Sydney	NA	Royal Prince Alfred
NA	NA	St Vincent's

Due to proximity the following LHD/ hospitals maintain referral networks as follows:
1. Northern NSW - Queensland. 2. Victoria.
3. The ACT (Canberra) - Batemans Bay, Batlow, Bombala, Boorowa, Braidwood, Cooma, Crookwell, Delegate, Goulburn, Moruya, Pambula, Queanbeyan, South East Regional (Bega), Tumut, Yass and Young.
4. Broken Hill - South Australia.

Adult Retrievals: Contact ACC 1800 650 004

11.4 NSW Rural Cardiac Catheterisation Laboratory Referrals (Adults)

Rural adult cardiac catheterisation services are located at Tamworth, Orange, Wagga Wagga, Port Macquarie, Coffs Harbour and Lismore.

Critically ill patients requiring time urgent inter-hospital transfer from a rural cardiac catheter service to a tertiary hospital for an urgent procedure (usually interventional cardiology or surgery) should be immediately transferred, regardless of bed availability as per Section 7.

The ACC should be contacted to facilitate the transfer. Where an Intra-Aortic Balloon Pump (IABP) device is required for an aeromedical transfer the ACC, must provide their own IABP device (authorized for aeromedical transport) and team (both located in Sydney).

If an IABP is not absolutely required to manage an unstable patient, referring cardiologists should consider whether the presence of the IABP is more important than the necessary delay in transfer time it will incur. The ACC consultant can advise in individual cases what the time differential is likely to be.

The Cardiac Catheterisation Laboratory Referrals (Adults) defines services and networked LHDs.

Table 8: NSW Cardiac Catheterisation Laboratory Referral Networks

NSW Cardiac Catheterisation Laboratory Referral Networks	
Referring Local Health District	Receiving Cardiac Catheterisation Service
Far West	South Australia
Hunter New England	John Hunter
Murrumbidgee	St Vincent's
Mid North Coast	Prince of Wales
Northern NSW	Lismore, Queensland
Southern NSW	Australian Capital Territory (ACT)
Western NSW	Royal Prince Alfred

Due to proximity some LHD and hospitals may maintain specialty referral networks interstate.
Some sites listed may not be operational 24/7. Sites should periodically update local information to include availability
Retrievals- Adults: Contact ACC 1800 650 004

11.5 NSW Extra Corporeal Membrane Oxygenation (ECMO) Medical Retrieval Service

ECMO therapy is used in many tertiary hospital ICUs to temporarily support patients with cardiac and/or respiratory failure. Most commonly this is post cardiothoracic surgery or patients with refractory respiratory failure unresponsive to advanced mechanical ventilation techniques.

Patients who are in smaller hospitals with severe cardiac and/or respiratory failure may also be approaching or beyond the limits of conventional organ support (mechanical ventilation, inotropes etc.). Some of these patients are not safely transportable even by medical retrieval teams.

The NSW ECMO retrieval service enables patients in non-tertiary hospitals to receive this therapy if appropriate and be transported to a tertiary hospital for ongoing care.

ECMO is provided by either Royal Prince Alfred (RPAH) or St Vincent's Hospitals (SVH) via a roster system. The service involves collaboration between the active ECMO/ICU clinicians, medical retrieval services and NSW Ambulance. A combined ECMO and retrieval team is transported to the referring hospital with appropriate equipment to establish the patient on ECMO and transport the patient back to RPAH or SVH by helicopter, fixed wing or road vehicle.

To organise the referral and transfer of a patient requiring rescue ECMO the following steps must occur:

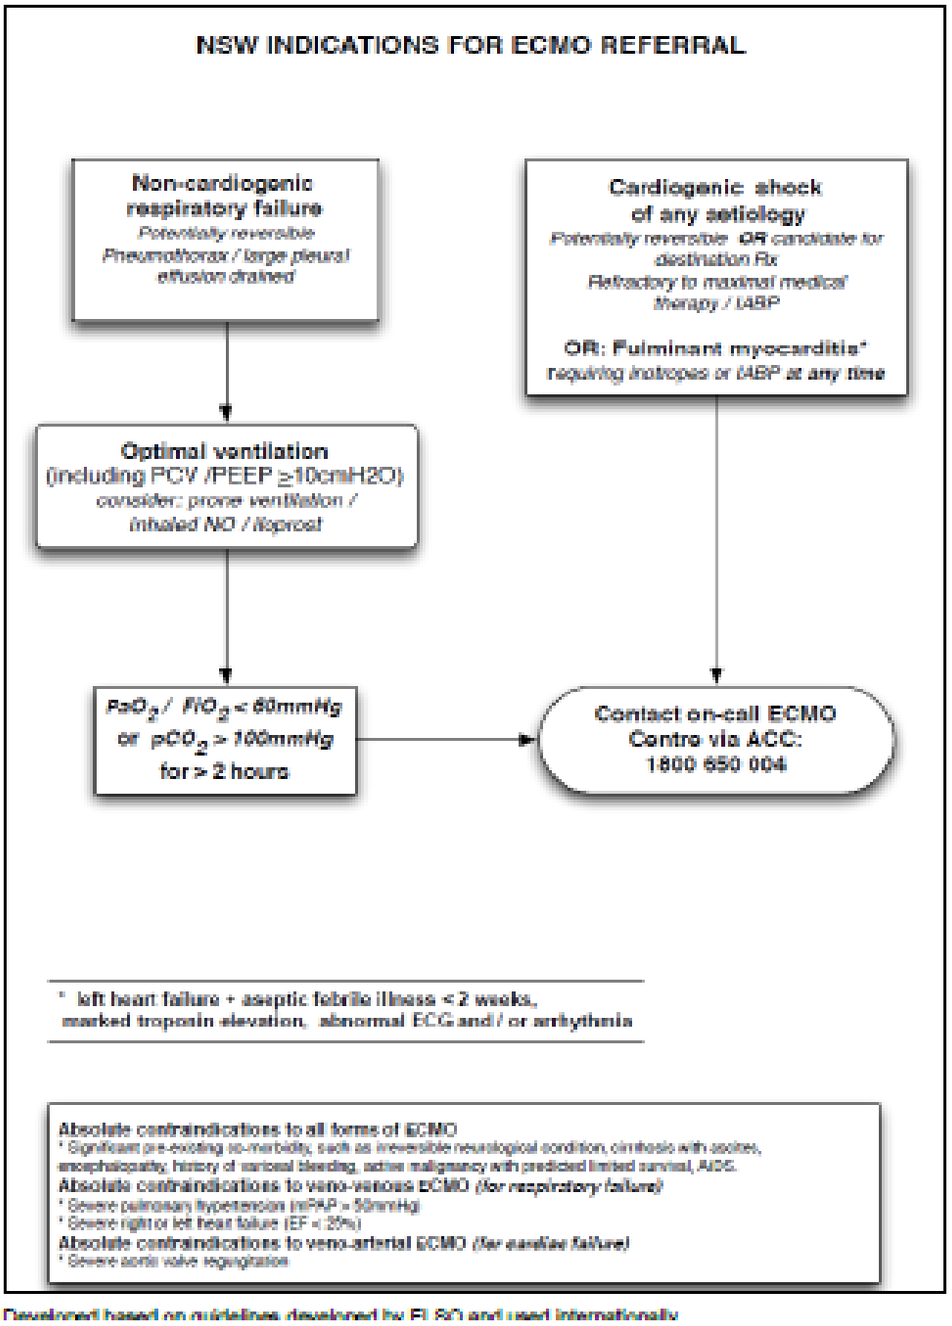
- Early notification of a patient potentially requiring referral for ECMO (Diagram 1)
- Initial contact to be made with ACC who will contact the active ECMO service
- A one phone call referral via conference call is used to connect the referring clinician, medical retrieval consultant and receiving ICU consultant
- The destination hospital will be determined according to the patients underlying condition, required clinical/surgical intervention and access to an available ICU bed.

ECMO Services	
Royal Prince Alfred Hospital	**St Vincent's Hospital**
PH: (02) 95156111 **Ask for**: ECMO intensivist on call	**PH:** (02) 83821111 **Ask for:** ICU North consultant on duty
The RPA and SVH ECMO roster is available at https://www.google.com/calendar/embed?src=7p3e1u53fvo59tkmfiok2qad6k%40group.calendar.google.com&ctz=Australia/Sydney (requires Chrome, not reliable with internet explorer)	

Retrievals- Adults: Contact ACC 1800 650 004

Case selection and treatment protocols used during ECMO are defined by the international Extracorporeal Life Support Organisation (ELSO). Diagram 1 outlines the indications for ECMO therapy and referral based on guidelines developed by ELSO and used internationally.

Diagram 1: NSW Indications for ECMO Referral



Developed based on guidelines developed by ELSO and used internationally

11.6 NSW Paediatric, High Risk Obstetric and Perinatal Referrals

All paediatric referrals and transfers must be arranged according to the Critical Care Tertiary Referral Networks (Paediatrics) PD 2010_030 1 and coordinated via NETS.

All high risk obstetric and perinatal transfers must be arranged according to the Critical Care Tertiary Referral Networks (Perinatal) PD 2010_0692 and coordinated via the Pregnancy Advice Line (PAL) and NETS on 1300 36 2500.

12 NSW Default Adult ICU Bed Policy

Access to emergency care and/or urgent surgical intervention for time urgent critically ill or injured patients must not be delayed due to no-available ICU bed. The ACC should be contacted immediately for such patients.

In time urgent situations, the ACC has the authority to transport the patient directly to the linked tertiary hospital designated by the NSW Adult Critical Care Referral Network regardless of bed state. If there is a closer facility that can provide the time urgent treatment, ACC may elect to transport the patient there.

Each LHD is ultimately responsible for meeting the critical care and intensive care needs (except for super-specialty services) of that LHD and linked rural LHD, where specified. This includes the provision of clinical advice and access to appropriate treatment. In addition, each LHD has a responsibility to ensure that all options for placement of the patient within the LHD have been explored and that all appropriate transfers from ICU to inpatient wards have been made to create capacity.

The LHD Chief Executive (CE) is responsible for; ensuring formalised intra and inter LHD and/or cross jurisdictional referral arrangements exist for critically ill or injured patients needing a higher level of definitive care and for non-critically ill or injured patients requiring referral for specialist care and; that clinical referral and support processes are transparent and effectively communicated to all staff to ensure patients can access definitive care in an appropriate timeframe. The ACC may contact the CE where necessary to resolve inter-LHD and non-urgent transfers.

The NSW default adult ICU bed policy may be invoked, when there are no adult intensive care beds available across NSW for a non-urgent critical patient. This must only occur after thorough assessment of ICU capacity and intra/inter-LHD critical care referral networks to ensure all potential referral options have been exhausted.

If the NSW Default Adult ICU Bed Policy is activated, the tertiary referral hospital designated by the NSW Adult Critical Care Referral Network (will be responsible for providing critical care, irrespective of bed status, to a specified group of referral hospitals. (Table 2 and Appendix 3). This responsibility includes assisting with patient placement to an appropriate alternative location for treatment and care.

The NSW Default Adult ICU Bed Policy is based on a hospital-to-hospital network and does not necessarily follow the normal LHD Critical Care Referral Networks.

In specific cases the referring clinician, retrieval consultant and the receiving clinician may decide to refer a patient to a different hospital which is considered more clinically appropriate for the patient’s definitive care.

If the default adult ICU bed policy is invoked, a phone referral via conference call, outlined in Section 4, must still occur and the receiving clinician **must** be notified as soon as possible and prior to patient arrival.

12.1 Invoking the Default Adult ICU Bed Policy:

- For time urgent patients, the ACC will contact the linked tertiary hospital, or if appropriate a closer facility, and transport the patient there, regardless of bed state.

- In all other cases, the referring hospital should contact their linked tertiary ICU. If the linked ICU does not have an available bed they are responsible for finding an alternative bed which may be within or outside of the LHD.

- All units to use their escalation policy to review exit blocked beds, liaise with the hospital executive to have them cleared and update CCRS.

- The LHD's tertiary ICU verifies that there are no appropriate available ICU beds either within or outside the LHD, with the assistance of CCRS.

- Where no appropriate available ICU bed can be identified across the system the **designated tertiary ICU** will accept the patient, irrespective of bed status.

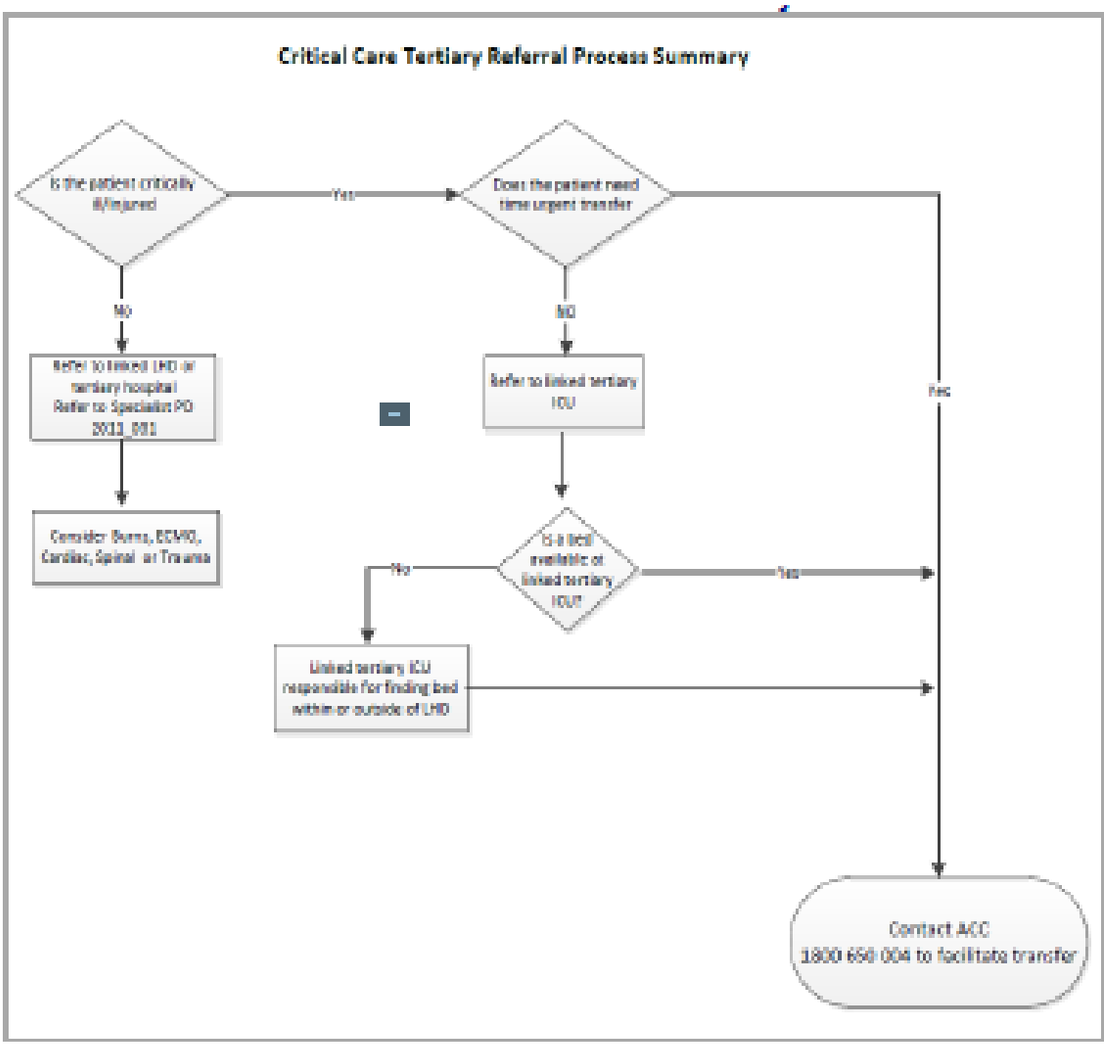
Prior to patient transfer a phone referral via conference call, outlined in Section 4, must occur and the receiving clinician must be notified as soon as possible and prior to patient arrival.

Fundamental to this procedure being activated is the principle that:

Where a patient requires time urgent critical care, not available at the referring hospital, then the patient must be transferred immediately to the facility designated by the NSW Adult Critical Care Tertiary Referral Network that is able to provide appropriate emergency treatment irrespective of bed status.

Aeromedical Control Centre (ACC) 1800 650 004.

APPENDIX 1: Critical Care Referral Process- Summary



- Time urgent referral - ACC 1800 650 004.(In emergencies notification can occur prior to full patient assessment and investigation)
- Non-time urgent referral - facilitated via CCRS via http://ccrs.health.nsw.gov.au
- Clinical specialty networks:
  - Burns - section 11.1:
    - Concord Hospital (02) 9767 5000
    - Royal North Shore Hospital (02) 9926 7111
  - Spinal - section 11.2
    - Prince of Wales Hospital (02) 9382 2222
    - Royal North Shore Hospital (02) 9926 7111
  - Trauma - section 11.3
  - Cardiac Catheterisation - section 11.4
  - Extra Corporeal Membrane Oxygenation (ECMO) - section 11.5
- Patients above 110kg must have bariatric sizing chart completed and sent to ACC.

APPENDIX 2: Escalation Pathway - Example

INSTRUCTIONS FOR MEASURING PATIENT

- Take measurements with patient lying on the mattress.
- Measure width of mattress (see diagram)
- Measure from side of patient to edge of mattress at A and B (refer to diagram below).
- Do these measurements at the patient's widest part. (This may be at the shoulders, abdomen or hips)
- Write results in boxes below. We will calculate the patient's width from the measurements you send us.

Width of Mattress	cm
Measurement A	cm
Measurement B	cm
Accurate Patient's Weight	kg
Patient's Height	cm

Widest Part (tick ✓ where measurements were taken at) Shoulders ☐ Abdomen ☐ Hips ☐

Inaccurate measurements may result in significant delay of transport of your patient.

When complete please fax to: 02 9553 2270

Thank you

AUTONOMIC DYSREFLEXIA (REVISED) – SAFETY NOTICE 014/10

Safety Notice 014/10 replaces IB2001/1.

Background

Autonomic dysreflexia is a medical emergency that can occur in people with spinal cord injury at or above the sixth thoracic (T6) level. It is a sudden and severe rise in blood pressure resulting from overactivity of an isolated sympathetic nervous system below the lesion, triggered by a nociceptive stimulus that can result in intracranial haemorrhage, fits, arrhythmias, hypertensive encephalopathy and even death. This potentially life-threatening condition requires immediate and decisive action.

Spinal units are very familiar with the diagnosis and treatment of autonomic dysreflexia. However, people with spinal cord injury most often present or are taken by an ambulance to their local healthcare facility. As spinal cord injury is not a common condition local healthcare professionals may have little or no experience in recognising or managing autonomic dysreflexia. This has resulted in preventable adverse outcomes with a minimum of 3-4 critical incidents reported each year in NSW.

Symptoms and Signs

The person may present with all or some of the following:

- Pounding headache, which gets worse as the blood pressure rises.
- Flushing or blotching of the skin and/or profuse sweating above Spinal Cord Injury (SCI) lesion level.
- Skin pallor and goose pumps below the SCI lesion level.
- Blurred vision, nasal congestion (stuffiness).
- Chills without fever.
- Shortness of breath, sense of apprehension or anxiety.
- Hypertension - blood pressure is significantly elevated (at least 20-40 mmHg above normal resting systolic level).

Note: It is important to remember that blood pressure for individuals with high paraplegia or tetraplegia may usually be low, around 90-100/60 mmHg lying down and possibly lower whilst sitting. Therefore, patients with spinal cord injury may become symptomatic with blood pressure in the normal range for the general population.

- Bradycardia (as secondary compensatory response to raised blood pressure).

Common Causes of Autonomic Dysreflexia

Any irritating stimulus below the level of the spinal cord injury lesion may precipitate autonomic dysreflexia. Causes of irritation include the following:

- Bladder-related: bladder distension, urine infection, calculus, epididymo-orchitis.
- Bowel-related: bowel distension from constipation, inflamed haemorrhoids, chemical irritation from suppositories.
- Skin-related: pressure sore, burn, ingrowing toenail.
- Other: fractured bones, contracting uterus, acute abdominal condition.

Treatment

Refer below for the Autonomic Dysreflexia Treatment Algorithm.

Treatment Alert

DO NOT use glyceryl trinitrate if sildenafil (Viagra) or vardenafil (Levitra) has been taken in the previous 24 hours or tadalafil (Cialis) in the previous 4 days. In situations where glyceryl trinitrate is contraindicated, an alternative (short-acting) anti-hypertensive agent, such as captopril should be used. Captopril, administered sublingually[1] as a 25mg tablet, has been shown to effectively lower blood pressure within 15 minutes. Advantages of sublingual administration are that the drug enters the general circulation directly, with therapeutic concentrations and onset of action achieved more rapidly than with oral administration. In addition, the partially dissolved tablet may be spat out if there is a very rapid reduction in blood pressure. A rectal examination or insertion of an indwelling catheter may exacerbate autonomic dysreflexia.

Suggested Actions

Emergency Departments and the Ambulance Service are often the first point of contact for the person with autonomic dysreflexia. To prevent delayed or missed diagnosis of autonomic dysreflexia, it is recommended that the following steps be followed.

Ambulance Officers and Services

- Ambulance triage officers should be familiar with the symptoms and signs of autonomic dysreflexia and be able to alert and dispatch Paramedics to respond quickly to this situation.
- When assessing a person with spinal cord injury at/above the T6 level, a high index of suspicion for autonomic dysreflexia is required. The person should be asked if they have had autonomic dysreflexia before and simple measures to reduce blood pressure should be taken.
- Ring ahead to alert the Emergency Department that a person with suspected autonomic dysreflexia is arriving.
- Ensure the autonomic dysreflexia management algorithm is readily available in ambulances.
- Provide education on autonomic dysreflexia management on a regular basis.
- Have glyceryl trinitrate sublingual (eg: Anginine tablets, Nitrolingual Pumpspray) or transdermal patches available.

Emergency Departments

- On arrival at the Emergency Department, the patient should be seen immediately by the triage nurse. Suspected autonomic dysreflexia should be assigned a Category 2.
- Care should be directed by the most senior doctor present in the Emergency Department (ED) with appropriate specialist consultation.
- The cause of autonomic dysreflexia needs to be identified and treated for resolution. If no cause is found and/or autonomic dysreflexia persists, blood pressure must be adequately controlled. Management of hypertensive crisis with intravenous medication may be required to control blood pressure, while contact is being made with a spinal specialist about further management (see below).
- After resolution of an autonomic dysreflexia episode, blood pressure should be monitored for 4 hours. In some severe cases of autonomic dysreflexia, the person should be admitted for observation.
- Ensure the autonomic dysreflexia management algorithm (see below) is easily available in the ED and education on autonomic dysreflexia management is provided.
- For facilities using the EDIS/FirstNet, a clinical alert should be entered onto the system noting that **"the patient is at risk of autonomic dysreflexia please refer to Safety Notice 014/10 - Autonomic Dysreflexia for guidance in the management of this condition".**

Staff in general hospitals and wards

- Any person with spinal cord injury at/above the T6 level should have a "when necessary" order for sublingual glyceryl trinitrate (eg Nitrolingual Pumpspray or Anginine tablet/s) recorded on the drug chart on admission.
- Development of symptoms and signs of autonomic dysreflexia requires immediate attention to assess blood pressure and look for reversible causes. If a reversible cause is not rapidly found, prompt medical review is necessary to further assess possible causes and initiate appropriate treatment.
- The autonomic dysreflexia management algorithm (see below) should be easily accessible.
- For facilities using the electronic medical record a clinical alert should be entered onto the system noting that "the **patient is at risk of autonomic dysreflexia please refer to Safety Notice 014/10 - Autonomic Dysreflexia for guidance in the management of this condition".**

Further Advice about Patient Management

If glyceryl trinitrate or captopril do not lower the blood pressure sufficiently and/or the cause of the autonomic dysreflexia has not been identified, please contact, via the hospital switch board, the on-call Spinal Cord Injury Physician at either Royal North Shore Hospital (02) 9926 7111 or the Prince of Wales Hospital (02) 9382 2222.

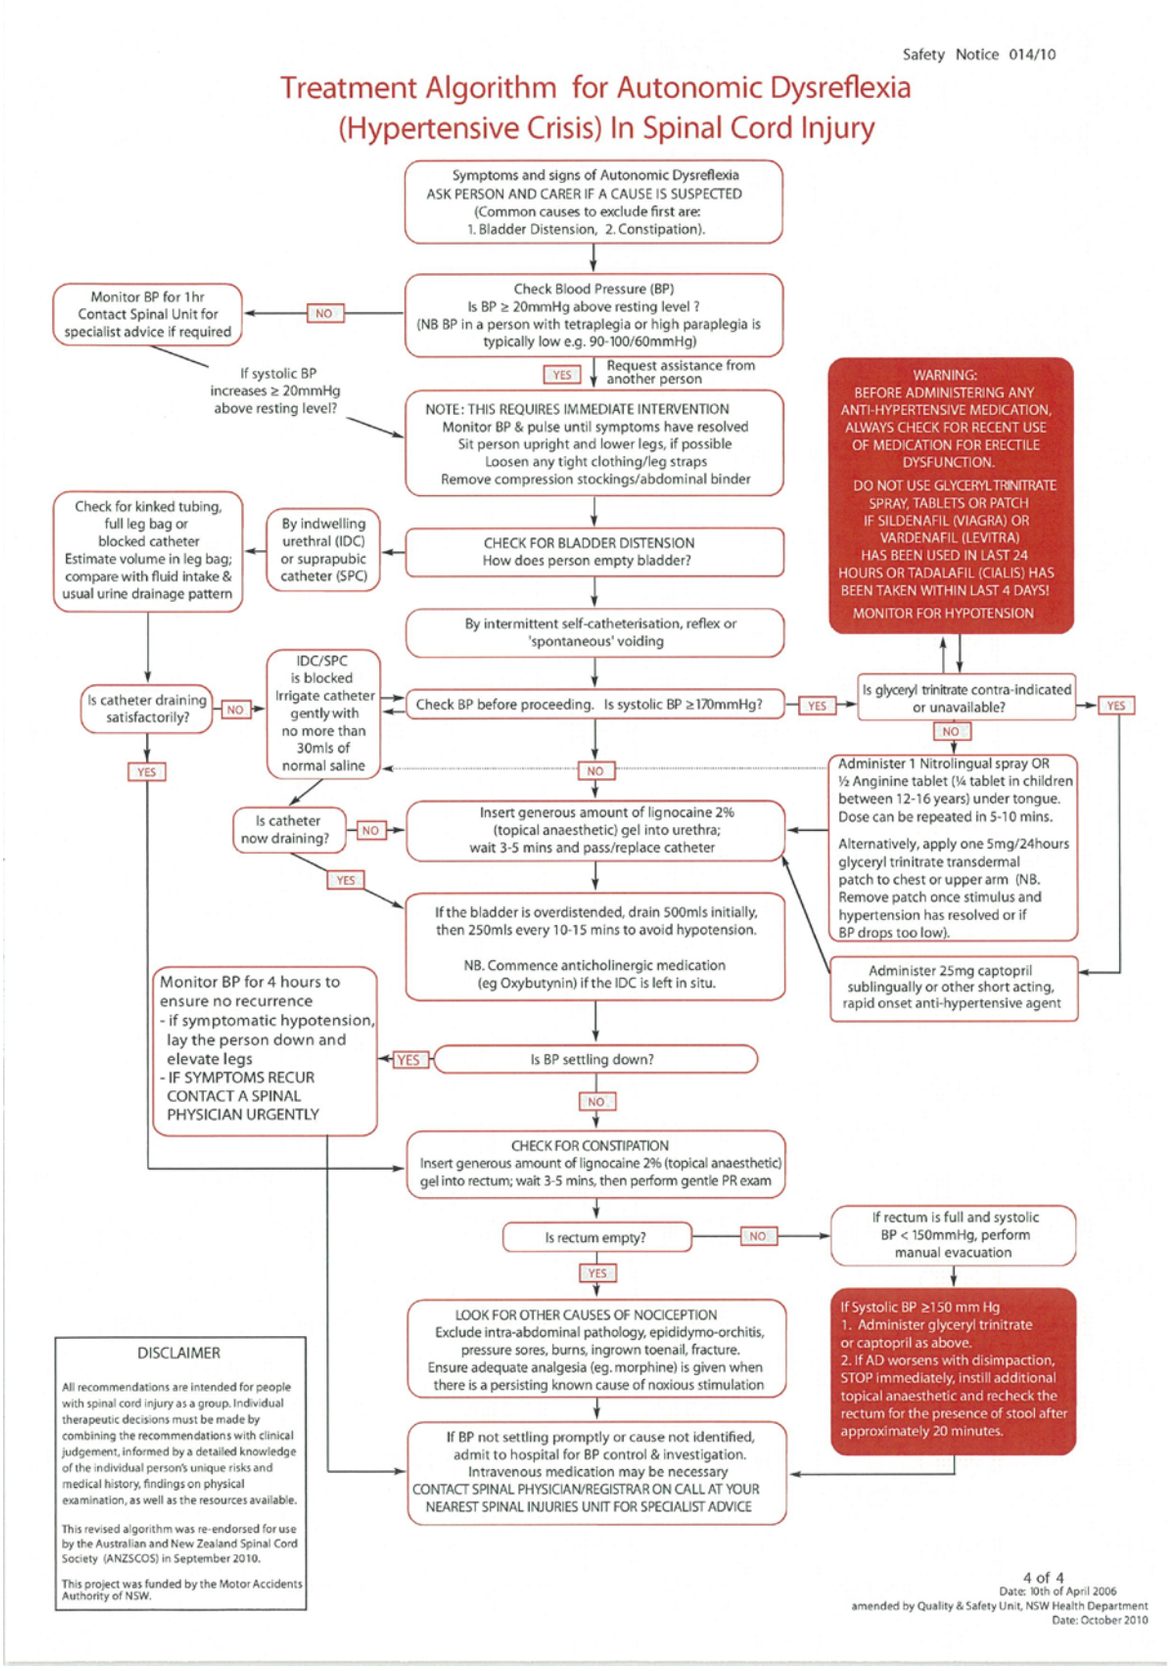
Other Suggested Actions

- Consult the patients and carers, determine if they know about this condition as they can often suggest a cause of the symptoms and management strategies.
- Check if patients are carrying an Autonomic Dysreflexia Management Card that can assist to identify the cause of symptoms and provide treatment strategies.
- It is suggested that Autonomic Dysreflexia is noted in the EDIS, NSW Health medical record or Electronic Medical Record Alert and NSW Ambulance Service Alert (Protocol 71 or electronic Mobile Data Terminal) systems.

Further Information about Autonomic Dysreflexia

The **NSW State Spinal Cord Injury Service** website includes clinical information sheets and practice guides about:

- Treatment of Autonomic Dysreflexia for Adults and Adolescents with spinal cord injury
- An Overview of Skin and Pressure Ulcer Management
- Management of the Neurogenic Bladder in spinal cord injury
- Management of the Neurogenic Bowel in spinal cord injury



Safety Notice 014/10
Treatment Algorithm for Autonomic Dysreflexia
(Hypertensive Crisis) In Spinal Cord Injury
Symptoms and signs of Autonomic Dysreflexia
ASK PERSON AND CARER IF A CAUSE IS SUSPECTED
(Common causes to exclude first are:
1. Bladder Distension, 2. Constipation).
Check Blood Pressure (BP)
Is BP ≥ 20mmHg above resting level ?
(NB BP in a person with tetraplegia or high paraplegia is typically low e.g. 90-100/60mmHg)
NO
Monitor BP for 1hr
Contact Spinal Unit for specialist advice if required
If systolic BP increases ≥ 20mmHg above resting level?
YES
Request assistance from another person
NOTE: THIS REQUIRES IMMEDIATE INTERVENTION
Monitor BP & pulse until symptoms have resolved
Sit person upright and lower legs, if possible
Loosen any tight clothing/leg straps
Remove compression stockings/abdominal binder
WARNING:
BEFORE ADMINISTERING ANY ANTI-HYPERTENSIVE MEDICATION, ALWAYS CHECK FOR RECENT USE OF MEDICATION FOR ERECTILE DYSFUNCTION.
DO NOT USE GLYCERYL TRINITRATE SPRAY, TABLETS OR PATCH IF SILDENAFIL (VIAGRA) OR VARDENAFIL (LEVITRA) HAS BEEN USED IN LAST 24 HOURS OR TADALAFIL (CIALIS) HAS BEEN TAKEN WITHIN LAST 4 DAYS!
MONITOR FOR HYPOTENSION
CHECK FOR BLADDER DISTENSION
How does person empty bladder?
By indwelling urethral (IDC) or suprapubic catheter (SPC)
Check for kinked tubing, full leg bag or blocked catheter
Estimate volume in leg bag; compare with fluid intake & usual urine drainage pattern
By intermittent self-catheterisation, reflex or 'spontaneous' voiding
Check BP before proceeding. Is systolic BP ≥170mmHg?
YES
Is glyceryl trinitrate contra-indicated or unavailable?
YES
NO
Administer 1 Nitrolingual spray OR ½ Anginine tablet (¼ tablet in children between 12-16 years) under tongue. Dose can be repeated in 5-10 mins.
Alternatively, apply one 5mg/24hours glyceryl trinitrate transdermal patch to chest or upper arm (NB. Remove patch once stimulus and hypertension has resolved or if BP drops too low).
Administer 25mg captopril sublingually or other short acting, rapid onset anti-hypertensive agent
NO
IDC/SPC is blocked Irrigate catheter gently with no more than 30mls of normal saline
Is catheter draining satisfactorily?
NO
YES
Is catheter now draining?
NO
YES
Insert generous amount of lignocaine 2% (topical anaesthetic) gel into urethra; wait 3-5 mins and pass/replace catheter
If the bladder is overdistended, drain 500mls initially, then 250mls every 10-15 mins to avoid hypotension.
NB. Commence anticholinergic medication (eg Oxybutynin) if the IDC is left in situ.
Monitor BP for 4 hours to ensure no recurrence
- if symptomatic hypotension, lay the person down and elevate legs
- IF SYMPTOMS RECUR CONTACT A SPINAL PHYSICIAN URGENTLY
YES
Is BP settling down?
NO
CHECK FOR CONSTIPATION
Insert generous amount of lignocaine 2% (topical anaesthetic) gel into rectum; wait 3-5 mins, then perform gentle PR exam
Is rectum empty?
NO
YES
If rectum is full and systolic BP < 150mmHg, perform manual evacuation
If Systolic BP ≥150 mm Hg
1. Administer glyceryl trinitrate or captopril as above.
2. If AD worsens with disimpaction, STOP immediately, instill additional topical anaesthetic and recheck the rectum for the presence of stool after approximately 20 minutes.
LOOK FOR OTHER CAUSES OF NOCICEPTION
Exclude intra-abdominal pathology, epididymo-orchitis, pressure sores, burns, ingrown toenail, fracture.
Ensure adequate analgesia (eg. morphine) is given when there is a persisting known cause of noxious stimulation
If BP not settling promptly or cause not identified, admit to hospital for BP control & investigation.
Intravenous medication may be necessary
CONTACT SPINAL PHYSICIAN/REGISTRAR ON CALL AT YOUR NEAREST SPINAL INJURIES UNIT FOR SPECIALIST ADVICE
DISCLAIMER
All recommendations are intended for people with spinal cord injury as a group. Individual therapeutic decisions must be made by combining the recommendations with clinical judgement, informed by a detailed knowledge of the individual person's unique risks and medical history, findings on physical examination, as well as the resources available.
This revised algorithm was re-endorsed for use by the Australian and New Zealand Spinal Cord Society (ANZSCOS) in September 2010.
This project was funded by the Motor Accidents Authority of NSW.

MATERNITY – RESUSCITATION OF THE NEWBORN INFANT (GL2018_016)

GL2018_016 rescinds PD2008_027

PURPOSE

This Guideline aims to optimise, facilitate and standardise newborn resuscitation by endorsing the Australian and New Zealand Committee on Resuscitation (ANZCOR) Guidelines - Section 13: Neonatal Guidelines (2016- 17)1 for use by NSW Health.

KEY PRINCIPLES

This Guideline applies to all clinicians who care for newborn infants in maternity and related environments and to the resuscitation of the newborn immediately following birth and during the birth admission.

USE OF THE GUIDELINE

This Guideline:

- replaces the Policy Directive PD2008_027 Maternity - Clinical Care and Resuscitation of the Newborn Infant
- endorses ANZCOR Guidelines (2016-2017) Section 13 - Neonatal guidelines 13.1-13.10 and the Newborn Life Support algorithm (Attachment 1)
- outlines local health district responsibilities to develop systems to ensure:
  - clinicians are appropriately targeted to complete mandatory and recommended newborn basic life support education, training and proficiency requirements
  - locally determined clinicians complete newborn advanced life support education, training and proficiency requirements, and are in attendance at the birth of newborn infants who are at higher risk of requiring resuscitation at birth
  - standardised newborn resuscitation equipment is available and operational and clinicians are familiar with the equipment
  - local procedures are in place to review resuscitation interventions and outcomes to monitor patient safety and quality of care and improve training and performance.

To download the complete Maternity – Resuscitation of the Newborn Infant Guideline please go to: https://www1.health.nsw.gov.au/pds/Pages/doc.aspx?dn=GL2018_016

HOSPITAL RESPONSE TO PANDEMIC INFLUENZA PART 1: EMERGENCY DEPARTMENT RESPONSE (PD2007_048)

Section 1: Overview

Introduction

This document describes the response of emergency departments (EDs) and multi purpose services to an influenza pandemic. For simplicity, when the term 'emergency department' is used in this document, it refers to all facilities in NSW with an emergency department, and all multi purpose services.

Due to the wide variability of health care facilities in New South Wales (NSW), a document such as this cannot be entirely prescriptive. Rather, it should be seen as a guide for developing and implementing a local response to pandemic influenza. Strategies will need to be implemented at each facility to ensure they meet the objectives described in this document.

The two main stages of the pandemic response are the containment stage and the 'maintenance of social function' stage.

In the containment stage, the emphasis is on slowing the spread of a pandemic to reduce the burden on the health system and to buy time for the development of a pandemic influenza vaccine. The main strategies in this stage are to:

- prevent people with pandemic influenza entering Australia
- find people with pandemic influenza, isolate them, and treat them with antiviral medication
- trace the contacts of these people, provide them with antiviral prophylaxis, and quarantine them.

A close liaison between clinicians and public health unit (PHU) personnel is vital for containment to be successful.

The 'maintenance of social function' stage will occur when the resources required for containment are exceeded. In this stage, the key role of EDs will be to manage the potentially large number of patients with pandemic influenza who require high level medical care.

A response to an influenza pandemic will require the mobilisation of resources from across the area health services (AHSs), particularly during the later stages. Each AHS will be required to develop plans to operationalise the ED response to an influenza pandemic at all facilities with an ED.

The *Hospital Response to Pandemic Influenza. Part 1: Emergency Department Response* document should be read in conjunction with the *Interim National Pandemic Influenza Clinical Guidelines* and *Interim Infection Control Guidelines for Pandemic Influenza in Healthcare and Community Settings*, which are appendices to the *Australian Health Management Plan for Pandemic Influenza* (AHMPPI) (June 2006).

Overview of emergency department response to an influenza pandemic

EDs have a key part to play in the response to an influenza pandemic in NSW, particularly in their role in activating enhanced ED triage and influenza screening stations.

6. EMERGENCY CARE 6.94

To respond to the changing nature of an influenza pandemic, a graded response to the threat will be required. This response will range from the establishment of enhanced ED triage (when a new influenza strain is reported to be causing clusters of human disease with human-to-human transmission overseas) to the establishment of ED screening stations (when there is a high likelihood that a patient meeting the case definition will present to an ED). Once there are clusters of cases in Australia that exceed (or are expected to exceed) the capacity of EDs such that a broader AHS response is required, stand-alone influenza clinics will be established. The role of stand-alone influenza clinics will be to see suspected pandemic influenza patients who are not in need of high-level ED care. Stand-alone influenza clinics will not provide high-level emergency care; this role will be maintained by the EDs.

The NSW Department of Health (NSW DoH) will request initiation and escalation of response through the AHS chief executives. The NSW DoH will define the level of the operational response required, which will depend upon the epidemiological characteristics of the disease, including the extent of pandemic influenza overseas, transmissibility of the pandemic influenza virus, and the level of morbidity and mortality resulting from the new influenza strain.

Table 1 summarises the levels of response required and the drivers that will determine the need for an increase in the level of response. All NSW public and private hospitals with EDs will be required to initiate the response described in this table. Each facility will need to consider their own circumstances and devise strategies to ensure they meet the response objectives.

Table 1. Description, drivers for activation, and purpose of emergency department (ED) response to an influenza pandemic

Response	Description	Drivers for activation	Purpose
Enhanced emergency department (ED) triage initiated	Additional screening conducted at the usual ED triage point, based on an up-to-date case definition.	Declaration of overseas pandemic alert phase 4[1] (OS phase 4) - clusters with human-to-human transmission overseas - where the clusters are occurring in a relatively isolated region. (If first clusters are in a major centre overseas, a move directly to pandemic influenza screening stations may be required.)	**Containment stage** To decrease the rate of transmission of pandemic influenza in the community, general practice surgeries, hospitals and other health care facilities by: ensuring rapid identification and isolation of suspected cases allowing diagnosis and treatment of cases with antiviral agents, if indicated providing a linkage with the public health response of contact tracing and provision of anti viral prophylaxis allowing collection of epidemiological and clinical data to inform clinical management and public health decisions.
ED pandemic influenza screening station established	Pandemic influenza screening station established at the entrance to ED to identify patients who meet the pandemic influenza case definition before they enter the waiting room.	No cases in Australia (Australian pandemic alert phase 0-3) but outbreaks occurring in areas overseas from which it is significantly likely that people will be travelling to Australia. Widespread outbreaks overseas. Significant morbidity and mortality from pandemic influenza overseas. Declaration of Australian pandemic alert phase 4 (i.e., clusters with human-to-human transmission in Australia).	**Containment stage** As for enhanced ED triage, and to allow a higher level of vigilance than provided by enhanced ED triage in light of an increased likelihood of pandemic influenza cases being encountered.
Stand-alone influenza clinic37 established. **ED pandemic influenza screening station established/maintained.**	A separate influenza clinic facility established to identify and treat those who meet the case definition for pandemic influenza. Note: an influenza screening station at the entrance to ED will still need to be maintained.	**At containment stage** ED capacity to isolate and manage suspected cases is exceeded. **At 'maintenance of social function' stage** Inability to contain pandemic influenza outbreaks (resulting in declaration of 'maintenance of social function' stage). Declaration of influenza pandemic (Australian phase 6b).	**Containment stage** As for enhanced ED triage, and to allow effective management of an increased number of pandemic influenza patients. **'Maintenance of social function' stage** To provide standardised assessment, triage, and management of patients with suspected pandemic influenza. To reduce patient presentations to EDs and general practices, thereby allowing those facilities to continue their core business and reduce the risk of transmission within those settings. To collect epidemiological data to monitor progress of the pandemic and inform optimal resource allocation.

[1]This assumes that a pandemic starts overseas. If a pandemic starts in Australia, an elevated level of response will be immediately required.
[2] The governance structure of the stand-alone influenza clinic will need to be determined by the area health service (AHS) and identified in AHS and facility plans.

Activation of enhanced triage, influenza screening stations and influenza clinics

The NSW Chief Health Officer (CHO) will notify the AHS chief executives of the change in the pandemic alert level and instruct AHSs to activate one of the ED response strategies listed below. The response will depend on the phase of the pandemic alert, the number and location of people with pandemic influenza, and the epidemiology of the new influenza virus. The three levels of response are:

- enhanced triage within EDs
- separate pandemic influenza screening stations
- stand-alone influenza clinics (note: if a stand-alone influenza clinic is required, screening stations will still need to operate at the entrance to the ED).

Activation of enhanced triage within EDs will be required within 8 hours of notification; activation of ED screening stations will be required within 12 hours, and activation of stand-alone influenza clinics within 48 hours. The NSW DoH will require confirmation by AHS chief executives that activation has occurred.

A pandemic influenza case definition to be used for screening purposes will be provided to all AHSs at, or shortly after, the formal request to activate an ED response. The new case definition, and subsequent case definitions, will be available on the **NSW Health intranet and internet websites**, and will be found immediately after the Netepi login page. Netepi is a web-based public health data collection and management system.

A detailed breakdown of the ED pandemic influenza response, according to the containment and 'maintenance of social function' stages, is provided in Section 2 of this document.

Governance structure

The governance structure for the various response levels will need to be determined by individual AHSs and outlined in the AHS plan.

Patient disposition

Following assessment of patients' clinical condition, likelihood of complying with home isolation, and ability to care for themselves, patients will be either admitted to hospital and isolated or discharged for self-care in home isolation. The decision to discharge a potentially infectious patient must be made in consultation with the PHU and relevant specialists. Patients must remain in isolation (in hospital or at home) until an alternative diagnosis is made or the infectious period is over.

If admitted to hospital, the patient may be admitted to either the hospital to which the patient has presented or to another hospital in accordance with AHS plans for suspected and confirmed cases of pandemic influenza. If admitted to hospital, the patient should be cared for in a single room. Patients with confirmed pandemic influenza should also be cared for in a single room; however, if insufficient single rooms are available, patients with confirmed pandemic influenza can be cohorted and isolated in a separate ward or wing of the hospital. The number of staff who come into contact with the patient should be minimised.

The collection of clinical and demographic information required to facilitate contact tracing by the PHU will be an important activity in the ED response. The investigation does not have to be carried out in the ED, but it is important that the patient is kept in isolation at the facility while this investigation is being carried out.

Accompanying persons

It is likely that patients who are suspected of being infected with pandemic influenza will present with accompanying persons. In all but exceptional circumstances (e.g., where the suspected case is a child) accompanying persons who do not meet the case definition should be provided with information about pandemic influenza, have their contact details collected and provided to the PHU, and (upon advice of the PHU) be sent to home quarantine. The PHU will provide advice about the management of accompanying persons.

If the ED clinician decides that it is necessary for an accompanying person to remain with the patient, advice must be sort from the PHU before the accompanying person is allowed into the isolation room with the suspected case.

Management procedures for persons accompanying children presenting to a children's hospitals have not yet been finalised. This document will be updated when these procedures are available.

Section 2: Response levels

Enhanced emergency department triage

During the containment stage - when small clusters of human-to-human transmission of the new influenza virus have been reported overseas (WHO Overseas phase 4, Australian phase 0-3) - all facilities with emergency departments (EDs), and multipurpose services, will be required to commence enhanced ED triage with screening for pandemic influenza. Screening is to be performed at the beginning of the ED triage process, and provision must be made for the isolation and management of suspected pandemic influenza patients in single rooms. To ensure the safety of health care workers, screening should be conducted from behind a physical barrier such as a glass screen or by keeping more than a metre away from the patient. If this is not possible, full personal protective equipment (PPE) should be worn.

Operating requirements

Once advised to activate enhanced ED triage screening, a senior medical or nursing staff member, as designated in the AHS pandemic influenza plan, will be required to ensure:

- correct signage is displayed
- an up-to-date version of the case definition is available
- all presentations to ED are screened for pandemic influenza during the triage process
- there is a one-way flow of suspected pandemic influenza patients through the ED
- the availability of at least one single room to be used for isolating a suspected case of pandemic influenza (this room should be selected beforehand and identified in the AHS pandemic influenza plan)
- there is an adequate stock (20-100, depending on the facility size) of P2 masks and other PPE for use by the doctor/nurse(s) assessing and managing the suspected case(s), and that these staff use the PPE appropriately
- PPE stock is replenished as required

- a medical officer (or experienced nurse where no medical officer is normally available) is nominated to assess person(s) meeting the case definition. The staff member should be familiar with the case definition and with protocols for diagnosis, clinical management and infection control
- the PHU is contacted immediately upon identification of a suspected case
- viral swabs (as per testing algorithm) are readily accessible (the designated person should, ideally, be experienced in taking nose and throat swabs for viral testing, given the importance of obtaining a quality specimen for an urgent influenza test)
- surgical masks and hand washing facilities (or alcohol-based gel) are available for use by the suspected pandemic influenza case(s)
- screening staff have access to hand washing facilities and/or alcohol-based gel and wash their hands frequently
- availability of anti-influenza medication for treatment of pandemic influenza patients (this should be detailed in the AHS pandemic influenza plan)
- an appropriate cleaning regime in accordance with infection control guidelines is in place to disinfect areas potentially infected.

Operating procedure

The procedure for enhanced ED triage is described below. A flow diagram summarising the process is shown in Figure 1.

Step 1: Screen

- At first contact, all patients are to be asked the up-to-date pandemic influenza screening questions.
- If a patient meets the case definition, proceed to Step 2. If a patient does not meet the case definition, the triage process continues as normal.
- Refer to Figure 2 for a more detailed description of the screening process.

Note 1: In facilities where the implementation of enhanced ED triage is not possible (e.g., in facilities that do not have a permanently staffed ED), different strategies will need to be implemented to keep pandemic influenza out of the facility. Strategies may include an early move to setting up a screening station at the entrance to a facility.

Note 2: Once enhanced ED triage is implemented, ambulance officers will screen all patients upon pickup and report identified suspected pandemic influenza cases to facilities prior to arrival. Section 3 of this document provides more information on the role of ambulance officers in response to pandemic influenza.

Note 3: When there is an outbreak or outbreaks of pandemic influenza overseas but not in Australia (WHO Overseas phase 4 or above, Australia phase 0-3) the epidemiological screening questions (on travel history) are to be asked before the clinical questions because they are the more specific discriminators and because they can be asked while keeping a safe distance. Once cases are identified widely in Australia (implying that overseas travel/contact with someone who has travelled overseas to the affected areas ceases to be the discriminating factor) travel history will be removed from the case definition and clinical features will prevail.

Step 2: Isolate

- If a patient meets the case definition, treat them as a suspected case of pandemic influenza: provide them with a surgical mask, instruct them to wash their hands, and isolate them immediately in a single room. If a single room is not available, cohort pandemic influenza patients in such a way that risk of transmission is minimised.

Note: If a patient with suspected pandemic influenza has not been triaged immediately on arrival at the ED, the contact details of all the people within the ED waiting room (including other patients and staff) who have been in contact with the suspected case must be recorded in case pandemic influenza is later confirmed and contact tracing is required.

- Clean the triage area as per infection control guidelines.

Step 3: Assess/manage

- Continue subsequent assessment and management of the patient with suspected pandemic influenza in a single room. If the patient requires immediate medical intervention, this should be performed in the single room wherever possible.
- Obtain demographic information for the patient.
- Perform a clinical assessment.
- Obtain appropriate specimens for laboratory testing. Details relating to the collection of microbiological specimens can be found in *Pandemic Influenza - Interim Response Protocol for NSW Public Health Units.* For viral specimen collection, one viral swab (not a bacterial swab) from the right nostril, one viral swab from the left nostril and one viral swab from the throat (i.e., three swabs in total) are required.

Step 4: Notify/consult

- If the suspected case still fits the case definition, notify the PHU of the suspected case by telephone and provide details of information collected to date. PHU staff are available 24 hours a day in all areas of NSW; contact details are available in the AHS pandemic influenza plan or via the AHS switchboard or the NSW Health intranet contact directory.
- Consult with PHU staff and infectious disease and/or other relevant physicians regarding diagnosis and continued management of the suspected case.
- Obtain advice from the PHU about where specimens should be sent.

Step 5: Send specimens

- Following consultation with the public health unit and infectious disease physician, and confirmation that the patient meets the case definition for pandemic influenza, send specimens.
- Specimens are to be labelled ‘suspect case of pandemic influenza’.
- The hospital laboratory is responsible for notifying the reference laboratory and ensuring the urgent transport of the specimens to the reference laboratory for specific detection of the pandemic influenza strain. The two reference laboratories in NSW are the Institute for Clinical Pathology and Medical Research (ICPMR) at Westmead, and the South East Illawarra Area Laboratory Service (SEALS) at Prince of Wales Hospital, Randwick.

- Other specimens (including microbiological specimens) should be processed following usual procedures.
- Specimens are to be packaged and transported in accordance with the National Pathology Accreditation Advisory Council's *Requirements for the packaging and transport of pathology specimens and associated materials.* (The National Pathology Accreditation Advisory Council guidelines can be found at) **http://www.health.gov.au/internet/publications/publishing.nsf/Content/npaac-pub-transp-path-spec-drft**

Step 6: Treat

- If there is a high index of clinical suspicion for pandemic influenza, assess the patient for contraindication to anti-influenza medication and consider administering the first dose of treatment while awaiting the pathology result (given the importance of administering anti-influenza medication as early as possible after symptom onset), and certainly within 48 hours.
- If reference laboratory confirmation of the diagnosis is likely to take longer than 8 hours, it is recommended that the first dose of anti-influenza medication be administered as soon as possible.

Step 7: Admit/discharge

- If the pandemic influenza test is positive or a diagnosis of pandemic influenza cannot be excluded, admit the patient to hospital or, following assessment of the patient's clinical condition and ability to comply, discharge them to home isolation. Discharge of potentially infectious patients *must* be made in consultation with the PHU and relevant specialists.
- If a decision has been made to admit the patient and they do not require further care in the ED, they can be transferred out of the ED and into a single room elsewhere in the facility. Further clinical and public health follow up can occur in that single room.

Figure 1. Flow diagram for the screening, assessment and management of a suspected pandemic influenza case in the emergency department

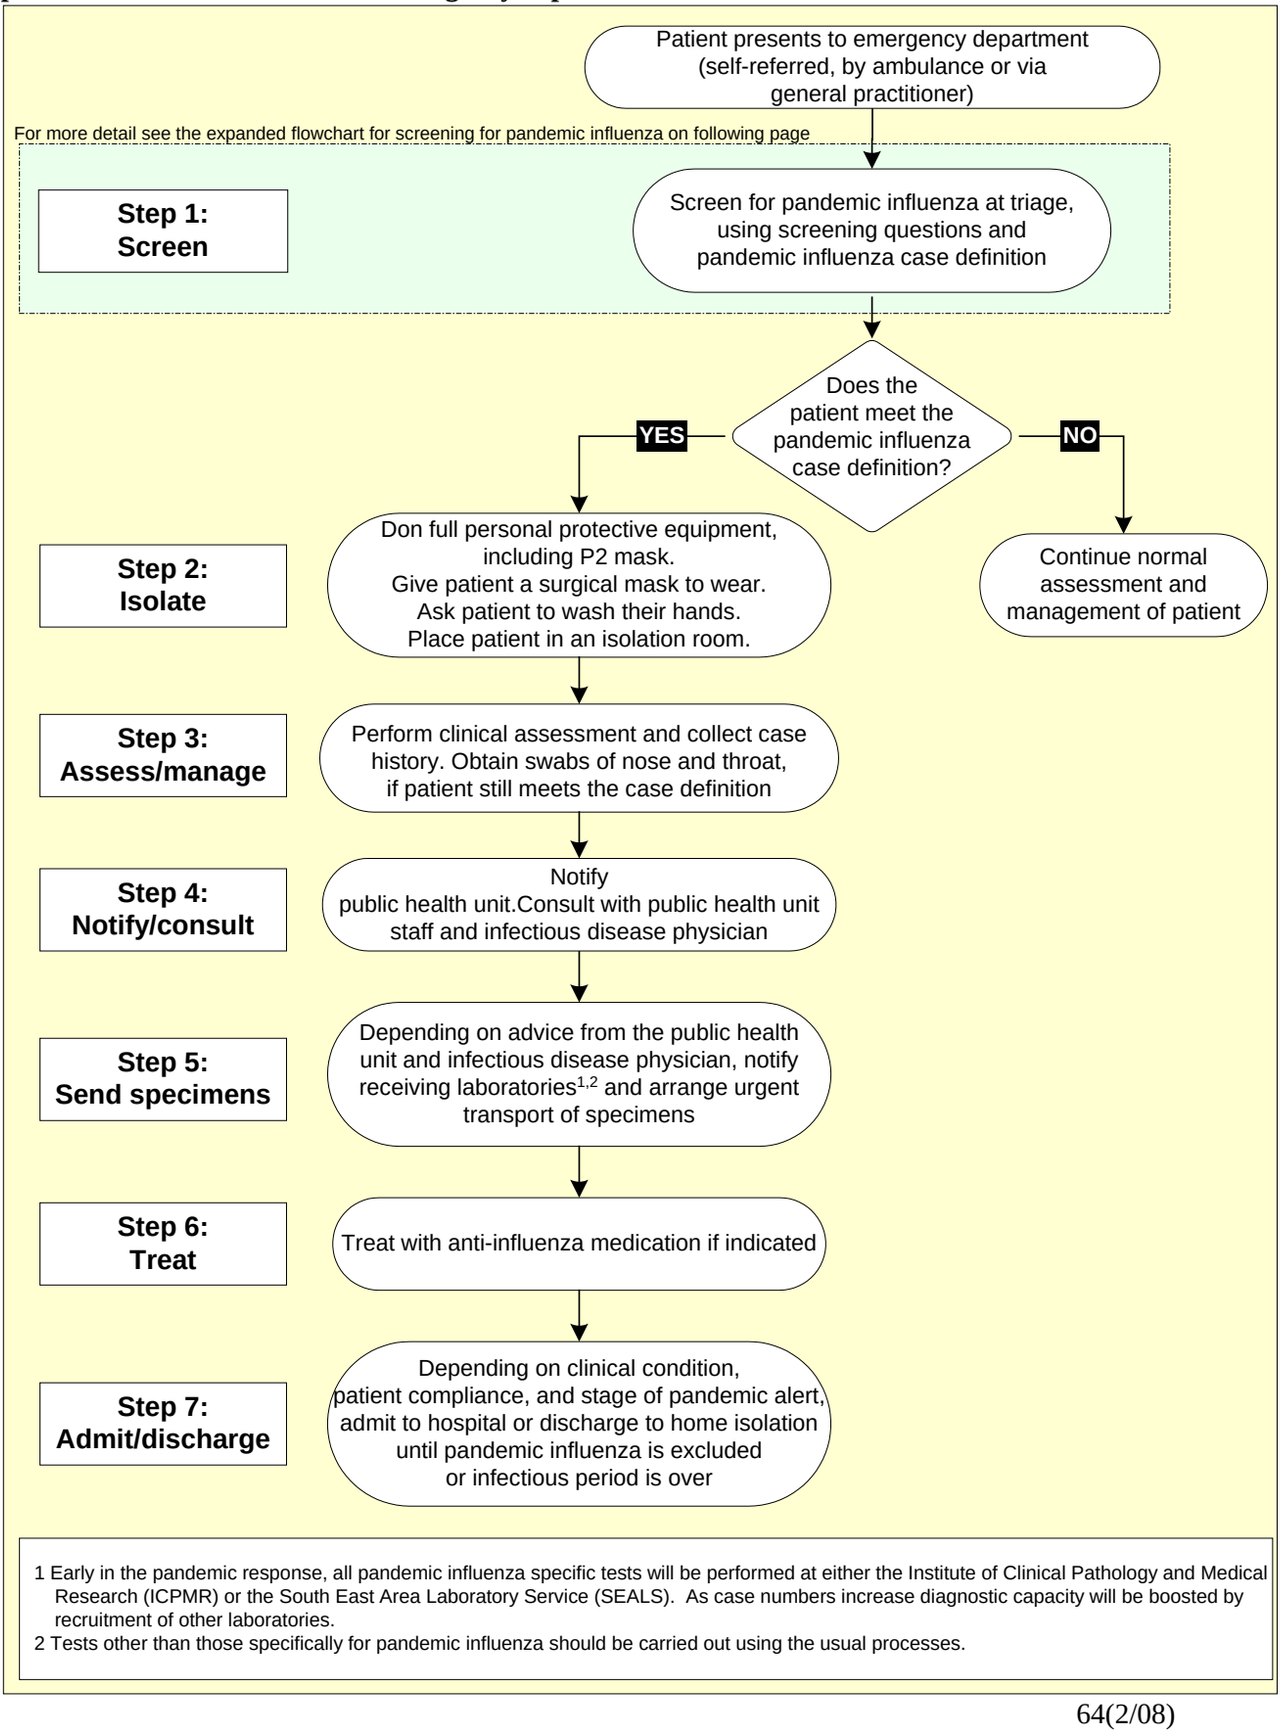

Figure 2. Flow diagram of the screening process for pandemic influenza

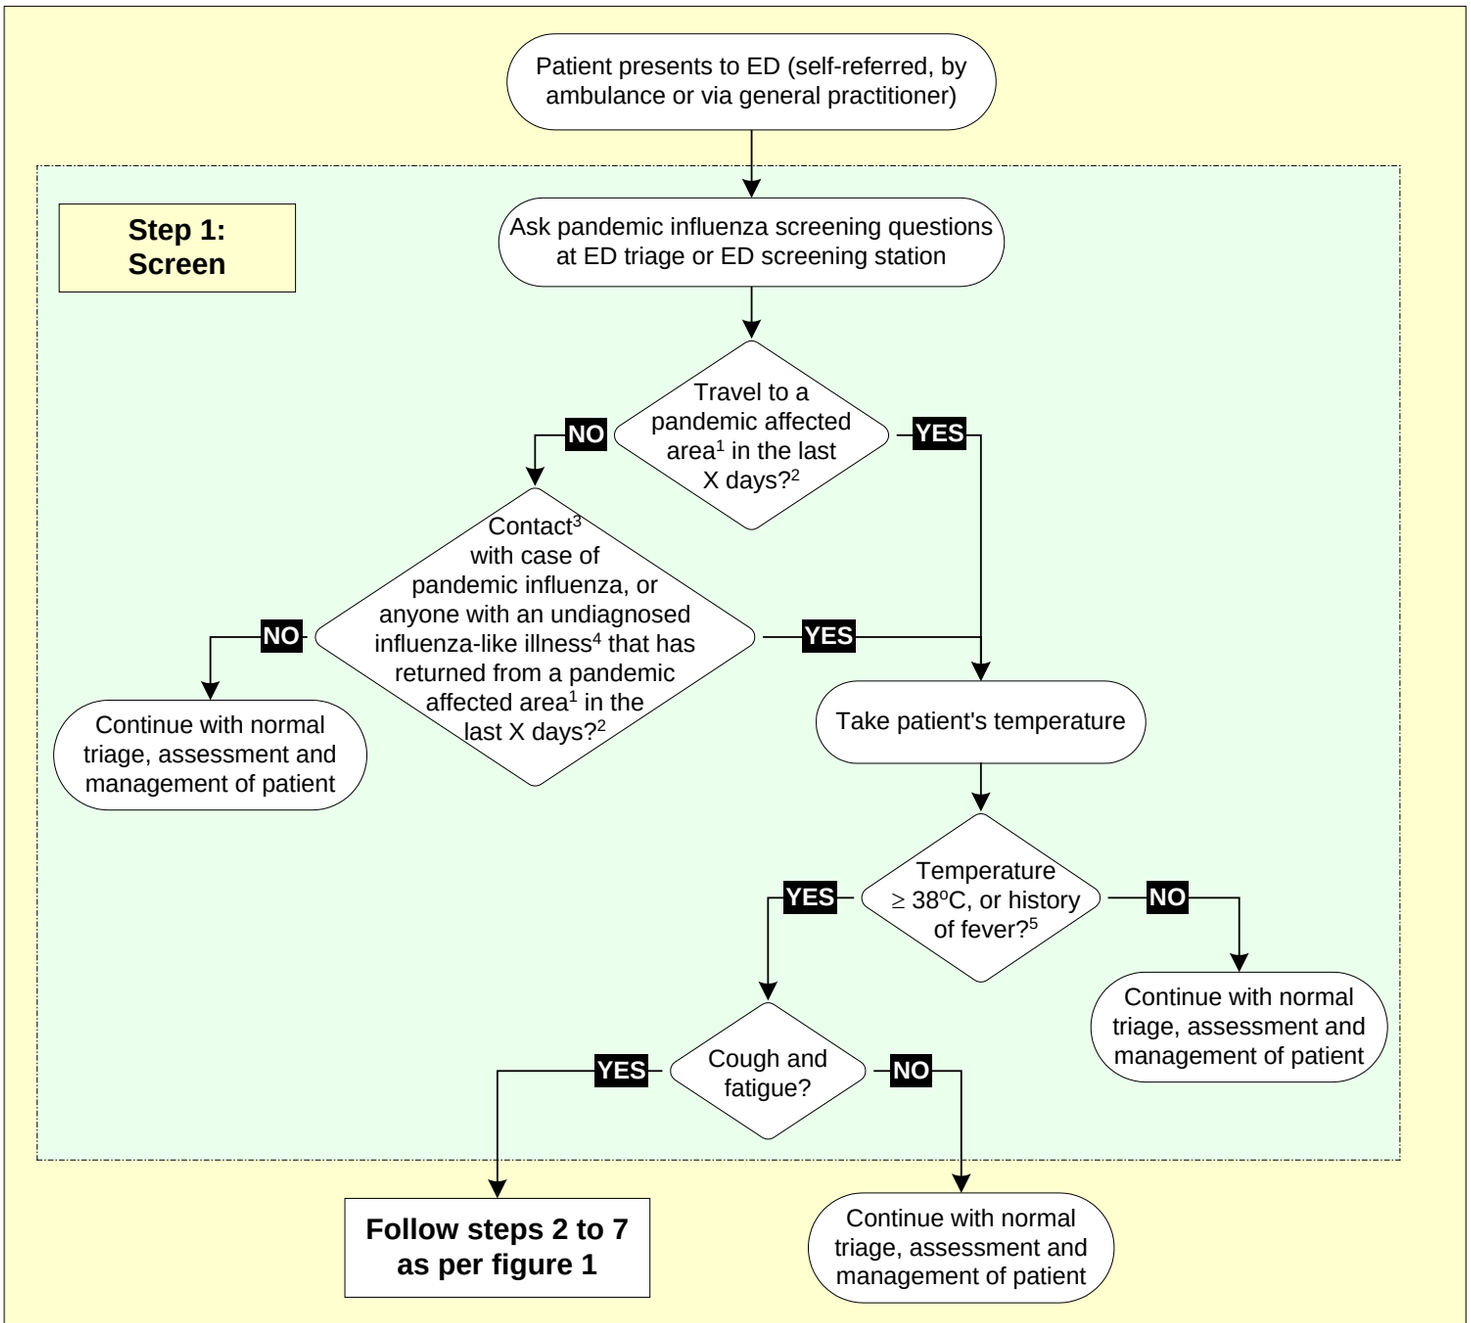


1 Pandemic affected areas may change rapidly. The most up-to-date listing of pandemic affected areas will be found in the case definition provided to hospitals and public health units, or at http://www.who.int/en/.

2 Number of days will depend on the epidemiological characteristics of the virus, including the incubation period and infectious period. This information will be included in case definitions provided to hospitals and public health units. If these values are not known, the default number is 7 days.

3 Contact is defined as having been within one metre of an infectious case, or in physical contact with a case or their respiratory droplets or secretions (see AHMPPI 2006 Annex: *Interim National Pandemic Influenza Clinical Guidelines,* pg 32 for more detail on definition of a contact).

4 An influenza-like illness is characterised by an abrupt onset of symptoms that includes fever and cough, and one or more of: headache, fatigue, sore throat, mylagia (muscle pain), chills and shortness of breath.

5 A history of fever includes either i) a recent temperature of≥ 38ºC (within the last 24 hours) as measured and reported by the patient, or ii) a description of chills and sweats, or a feeling of being hot, or hot and cold.

Emergency department screening stations

Screening for influenza using screening stations at the entrance to EDs (or in smaller facilities without permanent EDs, at the entrance to the facility) will commence when the likelihood of patients with pandemic influenza being encountered has increased to a stage that warrants screening of *all* people presenting to an ED *before* they enter the ED waiting room, and *before* they are triaged. This is expected to occur when Australia pandemic alert phase 4 is declared (clusters of cases with the new influenza strain with human-to-human transmission are reported in Australia) or when cases have not yet been reported in Australia but are occurring in major regional transport hubs. Activation of screening stations will be required within 8 hours in metropolitan and base hospitals and within 12 hours in rural hospitals. It is expected that close monitoring of epidemiological data will provide advanced warning that an elevation of response will be required.

It is possible that some parts of the state will establish ED screening stations, while others that are less likely to see patients with suspected pandemic influenza because of their distance from the reported cases of influenza, will continue with an enhanced ED triage response.

The driver for the activation of ED screening stations is principally an assessment that the new influenza virus poses an increased and imminent risk to NSW health facilities. This risk will be assessed based on the epidemiological characteristics of patients identified with the new influenza virus, the number and location of people with confirmed pandemic influenza , and the threat to the local area.

It is acknowledged that a number of very small facilities will not be able to implement screening stations. These facilities will need to be identified in AHS plans and will need to develop strategies locally to meet the objective of keeping pandemic influenza out of their facilities. Strategies may include screening through intercom, facility lock down, or advance screening by telephone.

A cascaded approach to ‘ramping up’ a broader whole-of-facility response to keeping pandemic influenza out of facilities will be implemented according to the level of threat. This will include limiting entry and exit points to facilities; limiting visitor number and times that visitors can enter facilities; postponing elective and non-urgent treatment for persons returning from pandemic influenza-affected areas; and screening staff. A policy designed to keep hospitals safe from the threat of pandemic influenza is being developed.

Operating requirements

In essence, an ED screening station is similar to the enhanced ED triage response, and the operating requirements are also similar. The significant difference is that with a screening station the screening for pandemic influenza will occur at the entrance to the ED and not at the normal ED triage point. Screening stations will need to operate 24 hours and screen all patients and accompanying persons who present to the ED. The location and management of this screening station will be described in the AHS pandemic influenza plan.

Operating requirements and procedure

The operating requirements for ED screening stations are similar to those for enhanced triage, described in Section 2.1, except that a screening table, chairs and, if appropriate, shelter will be required.

The operating procedure is also similar, apart from the changes and additions listed below.

Step 1: Screen

- All patients and accompanying persons attending the ED must be screened at the influenza screening station located at the entrance to the ED.
- All patients presenting are to be asked screening questions based on an up-to-date pandemic influenza case definition.
- If the patient does not meet the case definition, the patient proceeds to triage as normal.

Note: All staff at pandemic influenza screening stations must wear full PPE while screening and the screening station must be disinfected in accordance with infection control guidelines each time a suspect case is identified.

Steps 2 to 7

If the patient meets the case definition, follow **steps 2 to 7** (isolate, assess/manage, notify, send specimens, consult, treat, admit/discharge) as outlined in the enhanced ED triage operating procedure described in Section 2.1.

Refer to Figure 2, above, for a summary of the process of screening for pandemic influenza.

Stand-alone influenza clinic (during containment stage)

Stand-alone influenza clinics will commence operation in a location separate from the ED when the number of people with suspected pandemic influenza exceeds the capacity of the ED to isolate and manage them appropriately.

Stand-alone influenza clinics will require activation within 24 hours of notification in metropolitan and base hospitals and within 48 hours in rural and remote hospitals. It is expected that close monitoring of epidemiological data will provide advanced warning of the need to activate stand-alone influenza clinics.

During the containment stage, the key roles of a stand-alone influenza clinic will be to continue the process of containing the spread of pandemic influenza by enabling the rapid identification, isolation, and management of patients with suspected pandemic influenza, and to expedite follow up of their contacts by the PHU. Stand-alone influenza clinics will relieve the patient load on EDs by assessing and managing patients who do not require high-level care in an ED, thus allowing EDs to continue their core role of treating critically ill patients.

Stand-alone influenza clinics will not have the capacity to provide high-level emergency care; EDs will maintain this role. If a patient with suspected pandemic influenza is sick enough to require high-level emergency care, they will need to be transferred to the ED.

Stand-alone influenza clinics will need to be prepared to operate 24 hours per day and have their own dedicated workforce.

Stand-alone influenza clinics will initially be established on hospital campuses. As the number of people affected by pandemic influenza increases, stand-alone influenza clinics may need to be established at other sites.

Operating requirements

A stand-alone influenza clinic during the containment stage will perform the same function as the enhanced ED triage and screening station, but operate on a larger scale. The driver for establishing a separate influenza clinic is an increase (or anticipated increase) in the numbers of patients that meet the pandemic influenza case definition, or an increase in the numbers of patients presenting at EDs in order to be screened for pandemic influenza.

Note that a screening station will still be required at the entrance to the ED when a stand-alone influenza clinic is in operation. Refer to Figure 3, following, for a summary of screening procedures for pandemic influenza at EDs when stand-alone influenza clinics have been activated. The procedures are described in more detail in the next section.

Operating procedure

Patients are likely to present at the stand-alone influenza clinic via two mechanisms:
- after being screened and triaged at an ED, or
- having come directly to the influenza clinic (see Figure 3).

The text below describes operating procedures for both the ED pandemic screening station and the stand-alone influenza clinic.

(i) Patients presenting to the ED pandemic influenza screening station

Step 1: Screen
- All patients and accompanying persons attending the ED must be screened at an influenza screening station located at the entrance to ED.
- All patients and accompanying persons presenting need to be asked screening questions based on an up-to-date case definition for pandemic influenza.
- If the patient does not meet the case definition they should be instructed to proceed through the hospital system as normal.
- Patients that meet the pandemic influenza case definition and are *not* in need of emergency treatment should be provided with a surgical mask and asked to wear it, be asked to wash their hands and then sent to the separate stand-alone influenza clinic for treatment.
- Patients that meet the pandemic influenza case definition and that *are* in need of emergency treatment should be triaged and treated in a single room in the ED.

Steps 2 to 7

Follow **steps 2 to 7** (isolate, assess/manage, notify, send specimens, consult, treat, admit/discharge) as outlined in the enhanced ED triage operating procedure above.

Refer to Figure 2, above, for a description of the process of screening for pandemic influenza.

(ii) Patients presenting to the stand-alone influenza clinic after being screened and triaged at an ED

Step 1: Identify screened patients

All patients and accompanying persons presenting to the stand-alone clinic after being screened and triaged at an ED need to be identified and placed in a separate queue.

Steps 2 to 7

Follow **steps 2 to 7** (isolate, assess/manage, notify, send specimens, consult, treat, admit/ discharge) as outlined in the enhanced ED triage operating procedure above.

(iii) Patients presenting directly to the stand-alone influenza clinic

Step 1: Screen

- Patients and accompanying persons presenting directly to the stand-alone influenza clinic need to be screened to ensure that they meet the case definition:
  - If the patient meets the pandemic influenza case definition, they should be triaged and, if *not in need* of high-level emergency treatment, should be assessed and managed in the stand-alone influenza clinic
  - If the patient meets the pandemic influenza case definition, they should be triaged and, if *in need* of high-level emergency treatment, directed to the ED.
- Patients that do not meet the pandemic influenza case definition should be re-directed to the ED, other health care providers (a GP for example) or sent home. Patients that do not meet the influenza case definition should not be treated in an influenza clinic.

Steps 2 to 7

Follow **steps 2 to 7** (isolate, assess/manage, notify, send specimens, consult, treat, admit/discharge) as outlined in the enhanced ED triage operating procedure above.

Stand-alone influenza clinic (during 'maintenance of social function' stage)

The 'maintenance of social function' stage of an influenza pandemic will be declared when it is no longer possible to contain the spread of the new influenza virus in the community. Once the 'maintenance of social function' stage of the pandemic is declared, the purpose of stand-alone influenza clinics will change significantly, moving from a focus on containment (identification and isolation of patients, and quarantining of contacts) to a focus on maintaining essential health service delivery.

During this stage, stand-alone influenza clinics will operate as influenza triage, assessment, and management facilities for potentially large numbers of sick people. The stand-alone influenza clinic staff will determine whether the patient requires admission to a hospital or staging facility, or whether they can be discharged home with community follow-up as required. Laboratory testing for pandemic influenza will not routinely occur during this stage (unless the patient is hospitalised). Contact tracing will no longer be carried out. Current national policy is that stockpiled anti-influenza medications will be available for pre and post exposure prophylaxis and not for treatment of patients. However, this may change as the size of the stockpile is increased.

Operating requirements

The scope and capacity of the 'maintenance of social function' stage stand-alone influenza clinics will be determined by a number of factors including the epidemiological characteristics of the virus, the availability of anti-influenza medication for the treatment of cases and the availability of an effective vaccine.

Operating procedure

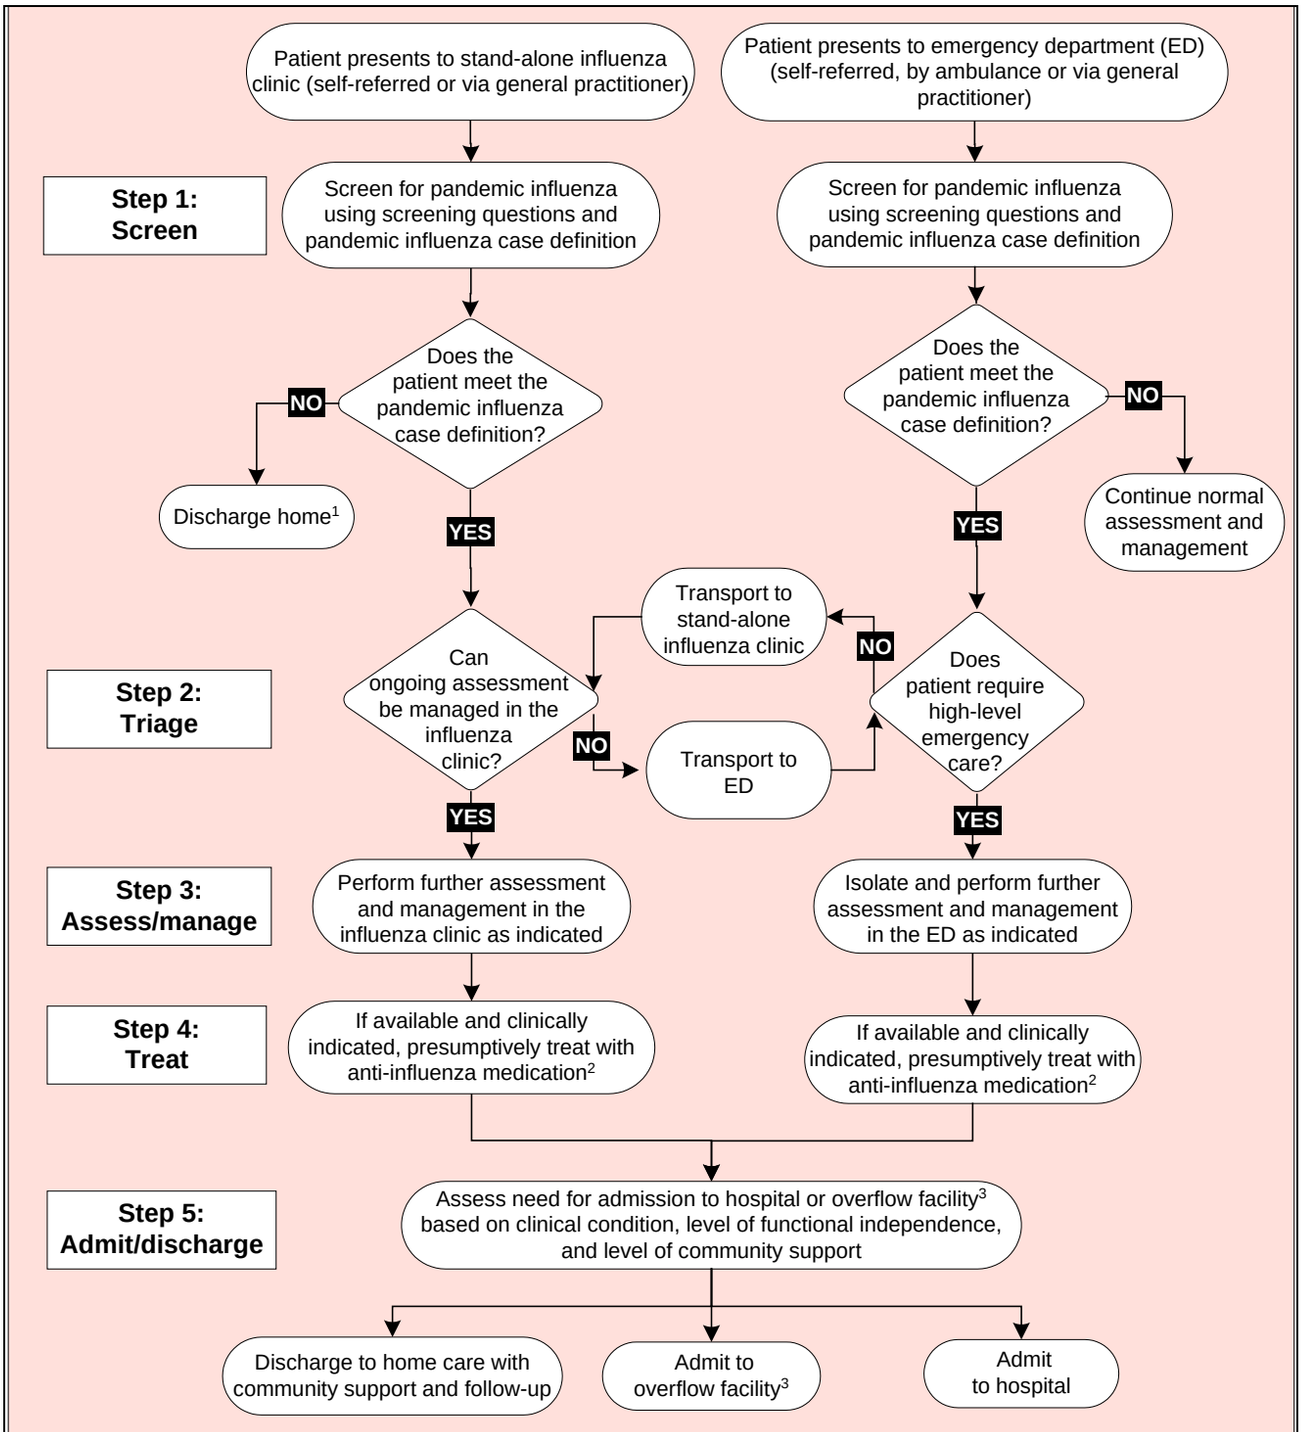
The procedure for operating a stand-alone influenza clinic during the maintenance of social function phase will be significantly different to those for previous response levels.

Staff in a stand-alone influenza clinic will:

- refer patients in need of high-level emergency care to an ED
- manage patients based on a clinical, rather than laboratory, diagnosis of pandemic influenza
- administer anti-influenza medication within 48 hours of symptom onset if medication is still available for treatment of patients, treatment is clinically indicated and there are no contraindications for treatment
- determine whether admission to a hospital, a staging facility, or discharge into home isolation with community follow-up, is required
- if discharging a patient to home care, provide appropriate advice to patient and carer(s) and refer for community follow-up.

A flow diagram summarising case management during the maintenance of social function stage is shown in Figure 3, below.

Figure 3. Flow diagram for the screening, assessment and management of patients with suspected pandemic influenza during the 'maintenance of social function' stage.



1 If the patient appears unwell or requires/requests further assessment, refer to a general practitioner or the nearest emergency department.
2 The current Australian policy for anti-influenza medication use during the maintenance of social function stage, is that if available, these medications will be used for pre- and post-exposure prophylaxis of workers considered to be at high risk through direct contact with influenza cases (see *Australian Health Management Plan for Pandemic Influenza*, June 2006, page 51).
3 Overflow facilities are temporary facilities for the accommodation and care of patients, when it is impractical to manage them at home or in a hospital. The role of these facilities will vary according to the severity of the pandemic but would, in general, be the provision of supportive care rather than the provision of high-level interventions.

Role of other health service providers

Role of general practitioners

The key role of general practitioners (GPs) during an influenza pandemic is to ensure that their usual primary health care services are maintained. If pandemic influenza is suspected in a patient, GPs are encouraged to provide the patient with a surgical mask, refer the patient to an emergency department (ED) or influenza clinic immediately, and notify the ED or influenza clinic that a suspect case has been referred. All suspected pandemic influenza patients should be referred to an ED or influenza clinic as these facilities have the capacity to appropriately assess and manage pandemic patients, access rapid diagnostic tests and anti-influenza medication, and contain further spread of infection.

An exception to this rule will occur in rural and remote areas where GPs may be the only health service provider, or be involved in providing ED response at a local facility. AHSs should plan with GPs as to what the GPs' role will be, and how the GPs' usual primary care role is to be maintained, particularly during the 'maintenance of social function' stage of an influenza pandemic.

The NSW DoH will provide information to all GPs when a change in pandemic alert phase occurs. This information will include advice to refer suspected pandemic influenza patients to EDs and will direct GPs to refer to the NSW DoH website to ensure they are up to date with current case definitions and protocols (e.g., infection control). GPs will also be asked to immediately notify their PHU and ED of any patients with suspected pandemic influenza that they identify and refer.

Role of Aboriginal Medical Services

In metropolitan areas, Aboriginal Medical Services (AMSs) will be encouraged to refer patients that meet the pandemic influenza case definition to EDs. In rural areas, a case-by-case assessment to define the role of AMSs will need to be undertaken, taking into account access to ED facilities, the capacity for isolation and management of patients, and the normal role of the AMS.

AHSs will be required to advise AMSs within their boundaries of any change in the pandemic alert phase or pandemic influenza case definition.

Role of private hospitals that provide emergency department services

The Hills Private Hospital, Kareena Private Hospital and Sydney Adventist Hospital are the only private hospitals in NSW that have EDs. These hospitals will be required to activate enhanced ED triage and ED screening stations at the same time as public hospitals. AHSs are responsible for notifying private hospitals within their boundaries whenever a change in pandemic alert phase and case definition occurs. The mechanism for notifying private hospitals and the role of private hospital EDs during an influenza pandemic, are to be described in the individual AHS influenza pandemic plans.

Role of the NSW Ambulance Service

Once enhanced ED triage is activated, NSW ambulance officers will screen all patients (that are able to be screened) for pandemic influenza on pick-up and, if a case is identified, will (if appropriate) provide the patient with a surgical mask and notify the ED of the suspect case in advance. When ED screening stations are activated, patients that cannot be screened will be presumed to be a suspect case of pandemic influenza, and treated accordingly until proven otherwise. The Ambulance Service of NSW is developing a protocol to guide this process.

The Ambulance Service of NSW is also in the process of developing a protocol defining when ambulances transporting patients who have been identified as suspected pandemic cases should by-pass smaller facilities.

The Ambulance Service of NSW will be involved in the transport of suspected and confirmed pandemic influenza patients between facilities. Protocols to cover this are being developed.

Role of pharmacies

The primary role of pharmacies during all stages of an influenza pandemic is to continue to provide their normal pharmaceutical services. Pharmacies in rural and remote areas in particular should plan for the need to continue to provide essential medicines during an influenza pandemic.

The NSW DoH will notify NSW pharmacies of a change in pandemic alert phase and the pandemic influenza case definition via the Pharmacy Guild. Pharmacies will be encouraged to refer patients that meet the case definition to the nearest public hospital ED.

PUBLIC HEALTH REAL-TIME EMERGENCY DEPARTMENT SURVEILLANCE SYSTEM (PHREDSS) – PUBLIC HEALTH UNIT RESPONSE GUIDELINES (GL2010_009)

PURPOSE

These guidelines describe the purpose and activities of the ED Surveillance Team in monitoring PHREDSS and reporting to Public Health Units (PHUs). It also describes the reasons that a PHREDSS Situation Report will be sent to a PHU and provides guidance for PHUs in considering activity in response to a PHREDSS Situation Report.

KEY PRINCIPLES

PHREDSS provides daily monitoring of ED visits presenting with various health problems grouped into syndromes. Each PHREDSS signal is assessed by the ED Surveillance Team before further reporting. The ED Surveillance Team issue a Situation Report via electronic mail to relevant Departmental and Area Health Service public health authorities for consideration if one or more of the following criteria are met:

- A higher than expected or sustained increase in ED visits (an unseasonal increase) for a syndrome;
- A significant change in the epidemiology of a syndrome (such as the age or sex distribution);
- An increase in the severity or urgency of the ED visits for a syndrome (based on admission status or triage category);
- An increase in an inherently severe syndrome such as meningitis/encephalitis, critical care admissions or deaths in ED; or
- An increase in a syndrome of particular interest to a stakeholder or stakeholder group (eg. influenza-like-illness, gastrointestinal illness, annual childhood asthma epidemics, drug or alcohol misuse).

USE OF THE GUIDELINE

The level of response from a PHU to a PHREDSS Situation Report should be graded according to:

- the apparent size of the increase in the syndrome reported;
- the severity of the illness being caused;
- the opportunity for intervention by the PHU; and
- any existing local knowledge.

NSW Department of Health may direct or provide guidance for a coordinated response.

PHREDSS provides daily monitoring of ED visits presenting with various health problems. Using the information transferred to the Department's PHREDSS database, computer programs automatically prepare statistical reports that highlight unusual trends in a range of acute health problems. Situation reports arising from the system are sent by PHREDSS personnel using electronic mail to relevant Departmental and Area Health Service public health authorities for consideration.

Surveillance Objectives

- To provide early warning of increases in disease activity in the population that may not be evident through other routine surveillance.
- To provide situational awareness and supplement other information on trends in acute disease and injury in the NSW population.
- To monitor syndrome epidemiology to assist the development and monitoring of prevention strategies for the causes of these syndromes.

Response options for the PHU receiving the situation report:

The level of response should be graded according to the apparent size of the increase, severity of illness being caused, opportunity for intervention and local knowledge. The NSW Department of Health may direct or provide guidance for a coordinated response.

Assessment should:

- Consider other available information such as notifiable disease reports, the presence of demographic changes through mass gatherings or similar events.
- Include case characteristics, such as: number of people affected, seasonality, age, sex, place of residence and severity of illness (as measured by increases in triage urgency or the proportion of patients being admitted for further treatment or being admitted to a critical care illness). Further information relating to a situation report can be obtained from the PHREDSS team or directly from the PHREDSS reports or other PHREDSS query tools (see next page).

Responses may include:

- For sharp increases in the number of ED visits apparently caused by infections or toxins, contacting the relevant ED director, (and other relevant personnel who managed the cases) to determine the likely cause of the increase and unless there is a good alternative explanation, encourage testing for likely causal agents on patients presenting over the next few days with similar syndromes.
- consultation with the relevant policy branch of NSW Health for advice.
- for diseases, including seasonal disease, where alerts to other clinicians or the public are considered likely to assist in prevention of further cases, the issuing of alerts through fax streams or the media.

Heightened surveillance

Options are available for heightened surveillance for planned events, such as mass gatherings, or emergencies. For planned events, several weeks notice is required. Options include: increased frequency of data updates; regular line listings of available data; reduced level at which increased activity is signalled, or creation of additional syndromes. For regular events, comparison with equivalent event days rather than the same weekday may be possible.

PHREDSS uses statistical methods to signal unusual occurrences in daily or weekly counts of ED visits categorised into a range of related diagnosis groupings. Each signal is assessed by the PHREDSS team before further reporting. Data available at 12 midnight on the previous day are included in the analysis. Total counts of ambulance arrivals, critical care ward admissions and ED deaths are monitored as well as diagnoses to identify large increases in severe illness. Reports are checked in the morning and afternoon on weekdays and mornings only on weekends and public holidays.

PHREDSS personnel evaluate each signal before issuing a "situation report", as follows:

- Has there been a recent increase in ED visits?
- Is the increase expected at this time of year (a seasonal increase)?
- How big is the increase compared with both recent and seasonal activity?
- Has the epidemiology of the syndrome changed (such as the age or sex distribution)?
- Has the severity or urgency of the visits increased (based on admission status or triage category)?
- How long has the increase been sustained?
- Is the diagnosis grouping inherently severe, such as meningitis/encephalitis, critical care admissions and ED deaths?
- Is the phenomenon of known interest to our stakeholders? E.g.: influenza-like-illness; gastrointestinal illness; annual childhood asthma epidemics; and drug or alcohol misuse.

The PHREDSS team issues a situation report if the answers to these questions justify informing relevant health stakeholders. The reports generally provide an overview summary along with a description of how the recent epidemiology compares with usual epidemiology. The epidemiological factors include age, sex, mode of arrival at ED, triage urgency, departure status from ED, locality of patient residence.

PHUs can view the PHREDSS reports directly. Various tools to assist with line listing review and statistical analysis (NetEpi Analysis) and 'keyword searches' to identify patient visits meeting certain presentation criteria are available from the home page of the PHREDSS reports. Available fields for each ED visit include: medical record number (for some hospitals); date and time of arrival; mode of arrival; presenting problem and triage nurse assessment; triage urgency category; mode of separation; and ED diagnosis. Patient names, addresses and dates of birth are not recorded.

The PHREDSS reports home page is available from the **Biosurveillance** link at:

hoist.health.nsw.gov.au (**NB**: this is on the intranet, not the internet).

A username and password are required, which can be obtained by completing the one-page form available at:

hoist.health.nsw.gov.au/Acumen_biosurveillance_confidentiality_agreement.pdf

and returning by facsimile to HOIST Support on: (02) 9391 9232.

For further information about PHREDSS please send an email to: **phredss@doh.health.nsw.gov.au**

RETRIEVAL HANDOVER (ADULTS) (PD2012_019)

PURPOSE

The purpose of this Policy is to confirm the process to ensure a coordinated handover and transfer of care between hospital clinicians and medical retrieval teams. Compliance with this Policy will minimise the chances of adverse events during handover of adult retrieval patients between hospital and retrieval teams.

A medical retrieval is defined as the interhospital transfer of an acutely or critically ill patient by a team that includes a medical (physician) escort. The majority of medical retrievals are done by teams with specific training, equipment and experience in out-of-hospital care for critically ill patients. These teams belong to medical retrieval services that are recognised and authorised by NSW Health.

This policy is intended for use by senior clinical medical and nursing staff in critical care areas of hospitals, particularly the Emergency Department and Intensive Care Units. The procedures for retrieval handover are regarded as a safe and appropriate approach for the efficient handover of clinical care of adult patients between the retrieval team and the senior clinician at the hospital.

Timely and efficient handover of clinical care of patients between the retrieval team and the senior clinician at the hospital should occur before the transfer of management begins (unless urgent resuscitation is required) to ensure a systematic transfer of patient care. The full transfer of care is completed once all monitoring and therapies are safely established and this is verbally confirmed by the team who are taking over the care of the patient.

This Policy is complements **Clinical Handover – Standard Key Principles (PD2009_060)** which mandates the implementation of standard principles for all types of clinical handover.

MANDATORY REQUIREMENTS

This policy requires all health services to have local guidelines/protocols for retrieval handover in place for all hospitals and facilities involved in the transfer of care of adult patients between hospital and retrieval teams.

IMPLEMENTATION

Chief Executives must ensure that health facilities implement a process for retrieval handover to ensure the safe transfer of patient care between retrieval teams and hospitals.

Attachment 1: Retrieval Handover (Adults)

RETRIEVAL HANDOVER PROCEDURE

The retrieval team is responsible for directing the coordinated handover and transfer of care.

This is a **vulnerable** time for the patient.

HANDOVER

- The handover should be between the most senior Hospital clinician caring for the patient and the Retrieval clinician.
- The handover should take place at a predictable time – an estimated time of arrival for the Retrieval team should be provided, with the expectation that the relevant team is **assembled at the agreed time**.
- The handover should occur **before the transfer of management** begins (unless urgent resuscitation is required). This ensures all staff listen to the handover and then focus on the systematic transfer of patient care.

HANDOVER PROCESS

1. **At handover the following information is exchanged:**
   - Presenting problem and relevant past history
   - Initial and current management (including monitoring, infusions, ventilation)
   - Response to management and current condition (including current vital signs)
   - Significant results - verbally, plus paper/electronic copy
   - A list of issues that need addressing within the next 60 minutes.
2. **Transfer to stretcher/bed**

   The hospital is responsible for ensuring that sufficient staff and equipment are available. The retrieval team is responsible for coordinating the move, as they are familiar with the retrieval equipment.
3. **Transfer Monitors**

   Monitoring should be transferred between the hospital monitors and retrieval bridge monitors one at a time. There should be no disruption to the continuity of monitoring.
4. **Transfer Therapies**

   Therapies should be transferred one at a time, at the direction of the Retrieval team.

   Ventilation:
   - Hospital bed to retrieval stretcher = transfer ventilation last
   - Retrieval stretcher to hospital bed = transfer ventilation first; note when transferring from retrieval to hospital equipment, the retrieval team will prescribe initial ventilation parameters.

   Drug infusions:
   - One drug at a time, like-to-like, ensure no dead space
   - Retrieval team will determine initial concentration and rate

   Specific therapies: i.e. intercostal drainage systems, EVDs, Sengstaken Blakemore tubes, IV fluids.

   Routine therapies: i.e. nasogastric tubes, urinary catheters etc.

Full transfer of care is not complete until all monitoring and therapies are safely established and this is verbally confirmed by the team who are taking over the patient.

EMERGENCY DEPARTMENT SHORT STAY UNITS (PD2014_040)

PURPOSE

This policy outlines the mandatory requirements for the use of Emergency Department Short Stay Units (EDSSUs) in NSW Hospitals. EDSSUs are Inpatient Units, managed by Emergency Department (ED) staff, designated and designed for the short term (generally up to 24 hours) treatment, observation, assessment and reassessment of patients initially triaged and assessed in the Emergency Department.

The National Partnership Agreement on Improving Public Hospital Services clearly states the requirements for EDSSUs in Australia. However further detail is required for NSW Hospitals to ensure correct implementation of these requirements.

MANDATORY REQUIREMENTS

Emergency Department Short Stay Units in NSW must adhere to the following principles:

- EDSSUs are Inpatient Units attached to emergency departments, managed under the clinical governance of the ED senior clinical management team located at the hospital.
- EDSSUs are designated and designed for the short term treatment, observation, assessment and reassessment of patients with selected conditions, initially triaged and assessed in the ED.
- The aim of EDSSU is to improve care of ED patients, improve the flow of patients through the ED, thereby improving ED bed access and reducing inpatient ward length of stay for EDSSU appropriate patients.
- EDSSUs must have specific admission and discharge criteria and policies. General principles for admission to EDSSU should focus on patients that are:
  - Clinically stable AND
  - Anticipated to require a period of observation or treatment less than 24 hours.

  In some facilities, it may be appropriate for clinically stable ED patients being transferred to another facility, after confirmation of timely availability of a bed at the accepting facility has occurred, to be admitted to EDSSU pending transport to the accepting facility.
- The design of the EDSSU should be a purpose built facility which allows it to be physically separated but in close proximity to the ED, have a static number of beds with oxygen suction and include its own patient bathroom and shower facilities.
- EDSSUs are not a temporary ED overflow area nor used to keep admitted patients who are solely awaiting an inpatient bed nor awaiting treatment in the ED prior to medical assessment.
- EDSSUs are staffed by dedicated Medical, Nursing and Allied Health staff with appropriate skills and knowledge to manage EDSSU patients. Patients are admitted under the care of the designated Specialist Emergency Physician rostered for EDSSU. In facilities with no Specialist Emergency Physician, other Specialist Medical Officers credentialed to admit patients to the hospital as a treating Specialist may be designated as responsible for EDSSU admissions.
- Patients admitted to EDSSU whose condition changes and therefore require a bed on an appropriate inpatient ward should have timely allocation of the bed through hospital patient flow processes. This is to ensure timely access to appropriate care and flow of ED patients into EDSSU is not impeded.

- Regular monitoring of EDSSUs is important to ensure efficient and appropriate use of EDSSU beds. An admission rate (from EDSSU into the hospital) of 10%-15% is considered acceptable.
- Regular review of incidents should be undertaken as per the EDs procedure for compliance with **PD2014_004 Incident Management Policy** and be included in ED Morbidity and Mortality meetings.
- Two specific measures for patients admitted to EDSSU (Bed Type 59) which are monitored on a statewide level are:

  1. Length of Stay in the EDSSU, reported as:
     - Percentage of all patients admitted to EDSSU with a LOS (in the EDSSU) less than or equal to 24 hours (calculated in minutes), and
     - Percentage of all patients admitted to the EDSSU with a length of stay less than 4 hours (calculated in minutes).
  2. Destination on departure from the EDSSU
     - Percentage of all patients admitted to EDSSU who were either:
       - Discharged home
       - Transferred to another admitted patient setting in the same service
       - Discharged to another health service.

  Local teams should review adherence to these monitoring measures.

IMPLEMENTATION

Local Health District Chief Executives are responsible for:

i. Assigning responsibility, personnel and resources to implement this policy.
ii. Establishing mechanisms to ensure that the Mandatory Requirements are applied, achieved and sustained as usual processes for admission of patients to EDSSU. This should include nomination of an executive sponsor.
iii. Ensuring that any local policy reflects the requirements of this policy and is written in consultation with hospital executive, Clinical Governance unit, ED senior management, and clinical staff.

1. BACKGROUND

1.1 About this document

This Procedure document supports and further explains the mandatory requirements of the Emergency Department Short Stay Unit (EDSSU) Policy through the following components:

- Background and use of EDSSU in NSW
- Clinical governance of EDSSU
- EDSSU admission and discharge criteria
- EDSSU design considerations
- Admitted patients in EDSSU
- Paediatric patients in adult EDSSU
- EDSSU staffing
- EDSSU monitoring measures.

1.2 Key definitions

- EDSSU – (also previously known as 'Emergency Medical Units' 'EMU' and 'ESSU') are Inpatient Units, managed by Emergency Department (ED) staff, designated and designed for the short term treatment, observation, assessment and reassessment of patients initially triaged and assessed in the Emergency Department.
- Bed type 59 - is a bed, staffed 24 hours a day that is designated for the accommodation of patients requiring emergency medical care who would otherwise have remained in the general Emergency Department. Beds in this category may be used for a mix of both day stay and overnight patients, but must be staffed for overnight patient care.

2. PROCEDURE FOR USE OF EDSSU

2.1 Background

Short stay medicine in Emergency Departments (EDs) offers intensive short-term assessment, observation or therapy, in a 'ward-like' environment, to optimise the early treatment and discharge of selected ED patients. The model is an alternative to extended stays in hospital EDs and/or the use of multi-day inpatient beds for short-term care.

The aim of the EDSSU is to improve care of patients requiring short term inpatient clinical management. EDSSUs have been shown to reduce inpatient ward length of stay for appropriately selected patients who would otherwise have been admitted to a ward bed, and improve care of those who may have stayed within the ED for prolonged periods. EDSSUs improve the flow of patients through the ED, thereby improving access to care for new emergency patients.

EDSSUs are designated for patients who are to be discharged within 24 hours. This includes stable patients who require observation and/or further investigation to ascertain the seriousness of their condition (e.g. minor head injury, chest pain, infections) or a short course of treatment for conditions that may be rapidly resolved (e.g. asthma, allergic reactions, snake bite and renal colic). Patients are admitted and managed under the care of local Specialist Emergency Physicians (EPs).

EDSSUs also provide a location for ED patients who may require allied health and social support intervention, such as physiotherapy, occupational therapy or social welfare services prior to discharge.

2.2 Clinical governance of EDSSU

Governance of the clinical and operational management of the EDSSU is the responsibility of the ED Director and Nurse Manager/Nursing Unit Manager.

Patients accepted for admission to EDSSU must be authorised by the duty Specialist Emergency Physician or delegate (e.g. emergency registrar overnight) following direct consultation.
Clinical governance includes:

- Review of the EDSSU admission policy and procedures for common Diagnostic Related Group admission categories.
- Medical governance to ensure that all practices in patient care delivery are consistent with high quality evidence based practice, and local LHD, state or national guidelines.
- Governance of patient care, safety and quality, incident reporting and management within an ED quality framework.
- Ensuring that peer review of clinicians involved in the care of patients in the EDSSU occurs and that supervision practices are adequate.

2.3 EDSSU admission and discharge criteria

EDs should devise local guidelines regarding the inclusion or exclusion of patients into EDSSU based on local availability of resources and practices which may/may not preclude the management within 24 hours. Some principles which may be used for development of local inclusion and exclusion criteria are as follows.

2.3.1 Patient Inclusion Criteria

Anticipated LOS < 24 hours

- EDSSU should target patients with a range of low to moderate risk symptom complexes who, with optimal diagnostic support and clinical management, can be discharged within a 4-24 hour period.
- There should be a focused goal for the period of observation.
- Patients should be clinically stable.

2.3.2 Patient Exclusion Criteria

Anticipated LOS >24 hours

The criteria for patient exclusion from an EDSSU will vary between institutions but should be consistent with the following principles:

- It is anticipated that the duration of treatment will be more than 24 hours.
- The patient is admitted under the care of an inpatient team. (local procedures for Hospital in the Home patients returning to hospital for review should be established.)
- The patient has been transferred to the hospital for admission under care of an inpatient team.

Clinical exclusion criteria

- The EDSSU cannot provide a suitable level of care or the patient has complex care needs which are unable to be met in the EDSSU.
- Psychotic/violent/disruptive patients/patients at risk of absconding, including patients detained under the **Mental Health Act 2007** may often be unsuitable to be cared for in EDSSU unless appropriate resources are available to manage them in the EDSSU environment. Forward planning of resource requirements for this group of patients must be undertaken and not addressed on an ad-hoc basis.
- The patient is clinically unstable. No patients with 'red zone' vital signs according to the **Standard Observation Charts** and Between the Flags process should be admitted to EDSSU unless there are documented alterations to the calling criteria.
- The patient has no clear diagnosis or provisional diagnosis.

2.3.3 Admission and Discharge procedures

Procedure for admitting a patient to EDSSU

- Discuss with the Specialist Emergency Physician or their delegate on duty for EDSSU.
- Complete an EDSSU admission which must include the applicable medical history, examination findings, provisional and differential diagnoses, a management plan and any outstanding results to be followed up.
- Complete a diagnosis in eMR.
- Complete a clinical hand over of the patient to EDSSU staff including outstanding results or reviews required, and subsequent management plan.

While in EDSSU

- Any patient in EDSSU must be included in clinical handover rounds.
- Minimum 4th hourly observations should be performed or as determined by Specialist Emergency Physician.
- The Specialist Emergency Physician must be informed about any deterioration in an EDSSU patient and normal escalation processes utilised across the ED/EDSSU should be followed.

On discharge from EDSSU

- Discharge of patients from the ED SSU will be to home or usual residence, inpatient unit (including Hospital in the Home) or another hospital.
- Discharge process should adhere to **PD2014_025 Departure of ED Patients** and follow the four principles of departure outlined in the policy.
- A discharge summary must be completed for all patients leaving EDSSU.

2.4 EDSSU design considerations

EDSSUs must be designed in a way that allows the unit to be physically separate but in close proximity to the ED. EDSSUs are designated inpatient care areas and as such, the physical design should reflect this. Design should be in line with the **Australasian Health Facility Guidelines – Emergency Unit**.

The Australasian College for Emergency Medicine **Emergency Department Design Guidelines** recommend *a minimum of 8 beds with the capability to monitor each bed to the same level as an acute cubicle*. Beds are to be static in number and are separate to the ED bed base. Decisions regarding final numbers of EDSSU beds/clinical spaces will be determined locally.

It is recognised that some EDSSUs may utilise a process where one clinical bed space may accommodate several recliner chairs for patients staying short periods in the EDSSU. This process should not be used for overnight patients and must ensure appropriate staffing and other resources are maintained.

A dedicated nursing station and adequate desk space for both medical and nursing staff is required. The EDSSU is to have its own patient toilet and shower facilities.

Additionally, the following criteria should be considered in EDSSU design:

- Should have a single room(s) with en suite for the management of short term infectious patients (e.g. gastroenteritis).
- Designs may allow for infection control cohort of patients (or as part of a disaster management response).
- 'Lounge area' where patients can be treated that do not require a bed.
- Beverage Bay facilities.
- Storage facilities as well as clean and dirty utility located in the unit (or in close proximity) to maximise productivity and efficiency.

2.5 Admitted patients in EDSSU

An admission rate (from EDSSU into the hospital) of 10%-15% is considered acceptable. as it provides a balance of appropriate patient selection, cost effective resource utilisation, and optimisation of quality of patient care.[38] Admission may be required due to a change in the patient's clinical condition or the subsequent requirement for specialised care and investigations outside of the remit of EDSSU. 229(20/11/14)

38 Chan, T., Arendts, G. and Stevens, M. (2008), Variables that predict admission to hospital from an emergency department observation unit. Emergency Medicine Australasia, 20: 216–220. doi: 10.1111/j.1742-6723.2007.01043.x

Patients must be referred, accepted and transferred from the EDSSU to another appropriate inpatient ward within the 24 hours of arrival to the EDSSU. Direct consultation between the Specialist Emergency Physician and the in-patient consultant (or their delegates) should facilitate clinical handover of the patient as well as the use of NSW Health Policy **PD2009_055 "Emergency Department- Direct Admission to Inpatient Wards"**

Movement of patients out of EDSSU to a hospital inpatient bed should be a priority to ensure continued flow of appropriate ED patients into EDSSU. Effective communication with the Hospital Bed Manager and After Hours Nursing Manager is essential.

Once transfer of care has taken place, all aspects of clinical care for those patients who are admitted under inpatient teams; but are still in the physical bed space of the EDSSU are the responsibility of the admitting team's Medical Officers. This includes liaising with family members and carers, reviewing medications, clinical reviews and appropriate discharge planning. Deterioration of these patients whilst they remain in the EDSSU should follow usual local escalation process with the patient being managed jointly by the inpatient team and EDSSU staff.

The EDSSU should not be used to board those patients who are known or expected to be admitted to an in-patient ward from the ED whilst waiting for that bed to become available. Patients who are admitted to inpatient wards via EDSSU are known to have longer total lengths of stay in hospital and utilise more resources than patients admitted directly to the hospital inpatient wards from the ED[39]

2.6 Paediatric patients in adult EDSSU

Children requiring short stay admission should be accommodated in paediatric specific units. NSW Health Policy states that "*children admitted to NSW Health acute facilities are not to be accommodated with adult patients"* **PD2010_033 Children and Adolescents - Safety and Security in NSW Acute Health Facilities**.

If no other option exists, any admission of paediatric patients to adult EDSSU is under the strict guidance of PD2010_033 to ensure they are accommodated in *designated paediatric safe beds.* These admissions should occur in consultation with the on call Paediatrician or delegate, or according to local procedures and care must be provided in accordance with the requirements of **PD2010_034 Children and Adolescents - Guidelines for Care in Acute Care Settings**.

The definition of a child in this document is any person under the age of 16 years, neonates excluded. It is acknowledged that adolescents are defined as those of an age 12-18 years.

Documented local processes may vary between units and are dependent on appropriate resources being provided, however the following principles should provide guidance.

No paediatric patient will be admitted to an EDSSU where the child is:

- Clinically unstable
- Has no definitive diagnosis
- Has no clear signs of clinical improvement following initial treatment
- Is subject to any suspicion of child protection issues
- Has any significant co-morbidity
- Has known acute mental health issues.

[39] Arendts, G. Mackenzie, J. & Lee, J.. Discharge planning and patient satisfaction in an emergency short-stay unit. Emerg. Med. Aust. 2006; 18: 7-14.

2.7 EDSSU staffing

Staffing must be commensurate with achieving the EDSSU key functions of: close observation, specialist assessment and diagnosis, short-term high-level care and management of patient conditions[40].

2.7.1 Medical Staffing

- A Specialist Emergency Physician will be designated and identified on the senior staff roster as EDSSU admitting officer at all times.
- Medical staffing of the EDSSU must ensure senior medical input is available and occurs for every patient.
- Medical staffing must be sufficient to meet the objectives of the EDSSU in providing quality timely care.
- Where junior medical staff are rostered to the EDSSU, the roster profile will be structured to allow direct supervision, on a case by case basis, for every patient by a more senior medical officer (at least registrar level).
- Medical staff in a supervisory role in the EDSSU must be specifically trained and credentialed in emergency medicine.

2.7.2 Nursing Staffing

- Staffing must meet the needs of the patient groups streamed to the EDSSU, and ensure reasonable nurse workloads are maintained.[41]
- A senior nurse in the EDSSU will be allocated per shift that will have first-line management responsibility for the running of the unit, and, working closely with the EDSSU Specialist Emergency Physician/or their delegate, to proactively 'pull' appropriate patients from ED into EDSSU.[3]
- At least 1 nurse per shift should be allocated to the EDSSU that has skills in Emergency nursing[42] [43] to ensure a range of patient conditions can be managed in the EDSSU.

2.7.3 Allied Health in EDSSU

The EDSSU should have dedicated allied health professionals with appropriate skills and knowledge to provide early intervention, discharge planning and prevent non-medical admission of patients.

Allied health services should be delivered as part of a multidisciplinary team, with staffing levels and skill mix varying in response to the clinical needs of the facility. For an EDSSU, it may be necessary for allied health professionals to work extended hours, on weekends or on-call.

2.8 EDSSU monitoring measures

The ongoing performance of the EDSSUs should be evaluated against the principles and intent of this policy. Data and other monitoring information should be used to drive improvements in service delivery, safety and quality in the EDSSU.

Services should establish mechanisms to ensure that their performance against relevant monitoring measures is regularly reviewed and where issues are identified that there are processes in place to facilitate appropriate action. Monitoring and review should address both the specifically identified state level indicators as well as other locally meaningful measures. 229(20/11/14)

[40] 2012 NSW Health. Emergency department models of care: Emergency Care Institute (**available:**)
[41] 2011 NSW Health. 2011. Public health system nurses' and midwives' (state) award.(**available**)
[42] 2013 College of Emergency Nursing Australasia, Standards for the Emergency Nursing Specialist (**available**)
[43] 2011 NSW Health Transition to Specialty Practice Emergency Nursing Program (**available**)

Core monitoring measures of for EDSSUs (Bed Type 59) at a state level will include:

- Length of Stay in the EDSSU, reported as:
  - Percentage of all patients admitted to EDSSU with a LOS (in the EDSSU) less than or equal to 24 hours (calculated in minutes) and
  - Percentage of all patients admitted to the EDSSU with a length of stay less than 4 hours (calculated in minutes).

- Destination on departure from the EDSSU
  - Percentage of all patients admitted to EDSSU who were either:
    - Discharged home
    - Transferred to another admitted patient setting in the same service
    - Discharged to another health Service

These measures will be calculated by the MoH using existing admitted patient data routinely submitted to the State centralised data warehouse. EDSSU patients should be included in local hospital Morbidity and Mortality meetings.

As well as the core state level indicators, services may wish to investigate the use of other locally meaningful measures, for example:

- Volume of patients admitted and discharged in ED – before and after establishment of the short stay unit.
- Volume of patients admitted from ED to other inpatient locations with LOS less than 24hrs.
- Unplanned representations to ED within 48 hours for patients discharged from an EDSSU.
- NSW Patient Survey Program information.

EMERGENCY DEPARTMENT, NURSE DELEGATED EMERGENCY CARE, MEDICATION STANDING ORDERS (PD2015_024)

PURPOSE

The Nurse Delegated Emergency Care (NDEC) patient care model has been developed to support rural and remote facilities provide care for patients presenting to Emergency Departments with low-risk, low-acuity conditions. Under NDEC the care of these patients is managed entirely by an appropriately trained and credentialed Registered Nurse (RN), under the explicit delegation of the site Medical Officer/s.

The statewide Standing Order authorises an appropriately trained and credentialed Registered Nurse to administer and/ or supply specified medications for the purpose of treatment of defined low-risk conditions specified under the NDEC patient care model. The Standing Orders describe procedures for ordering, storing, administering, and supplying (for take-home use) the specified medication. Any medication Standing Order must be used in conjunction with the applicable NDEC Nursing Management Guideline.

The statewide Standing Order for Nurse Delegated Emergency Care applies where the provision of medication is required to treat patients in the Emergency Department with certain less-urgent, low-risk conditions.

MANDATORYREQUIREMENTS

This policy is for the management of patients presenting to Emergency Departments with certain less-urgent, low-risk conditions by appropriately trained and credentialed registered nurses practicing under the NDEC model.

When the implementation requirements outlined in this policy are met, the statewide Standing Order provides the basis for Institutional/Local Health District (LHD) Drug and Therapeutics Committees (DTC) to adopt the NDEC patient care model. DTCs must review and endorse Standing Orders locally.

IMPLEMENTATION

In order to fulfil the standing order, supply of medications will need to be arranged with a public hospital pharmacy department, on behalf of the public health organisation, and at the request of the Public Health Officer (if a medical officer) or a medical officer designated by the District's Public Health Unit Director/Public Health Officer.

The standing order authorises a registered nurse to administer and supply medications to patients with defined conditions for the purpose of treatment of defined low-risk conditions. Administration or supply may only be carried out in Emergency Departments by registered nurses trained and credentialed to operate the Nurse Delegated Emergency Care patient care model.

LEGAL INSTRUMENT

POISONS AND THERAPEUTIC GOODS ACT 1966

Authorisation to Supply Poisons and Restricted Substances

PUSUANT to clauses 170 and 171 of the Poisons and Therapeutic Goods Regulation 2008, I, Dr Kerry Chant, Chief Health Officer, a duly appointed delegate of the Secretary of the Ministry of Health, do hereby grant AUTHORITY to registered nurses hereby specified as a class of persons, to supply those poisons and restricted substances listed in the Schedule hereunder either singly or in combination, pursuant to clauses 17 and 53 of that Regulation and subject to the following conditions:

(1) The registered nurse is employed in a public health organisation within the meaning of the Health Services Act 1997.
(2) The supply of the poisons or restricted substances is in accordance with the NSW Health Policy Directive PD2015_024, Standing Orders for the Supply or Administration of Medication under the NDEC Model.

SCHEDULE

cephalexin
chloramphenicol
ibuprofen
paracetamol

Dated: Sydney, 20 July 2015

Dr KERRY CHANT
Chief Health Officer
Ministry of Health, New South Wales

1 BACKGROUND

1.1 About this document

The Standing Order authorises an appropriately trained and credentialed Registered Nurse to administer and/or supply specified medications for the purpose of treatment of defined low-risk conditions specified under the Nurse Delegated Emergency Care (NDEC) patient care model. The Standing Orders describe procedures for ordering, storing, administering, and supplying (for take-home use) the specified medication. Any medication Standing Order must be used in conjunction with the applicable NDEC Nursing Management Guideline. The NDEC state-wide Guidelines and Standing Orders are for the management of patients presenting to Emergency Departments (EDs) with the following conditions:

- Minor burns
- Earache
- Eye problems
- Foreign body - minor
- Mild/minor head injury
- Insect bites and stings
- Soft tissue limb injuries
- Stings from marine creatures
- Pain
- Rash
- Respiratory type illness
- Tick bite
- Urinary symptoms
- Vomiting and Diarrhoea.

The state-wide medication Standing Orders form part of a comprehensive suite of patient care resources and, together with the Education and Accreditation Framework and implementation support materials and structures, comprise the Nurse Delegated Emergency Care model.

The NDEC patient care resources include a set of procedures known as Nursing Management Guidelines (NMGs) which can be found online: http://www.ecinsw.com.au/node/282. The NMGs direct all clinical care provided through the NDEC patient care model and these Standing Orders are only applicable in accordance with the appropriate NDEC NMG.

The Medication Standing Orders in this document include links to the relevant NMG, describing the types of clinical conditions for which they may be used.

1.2 Key definitions

Treatment	An intervention (including medication) to treat an individual case of disease or medical condition.
Supply/ Administration	To provide to or for a specific patient and is consistent with the definition of supply in section 4 of *the Poisons and Therapeutic Goods Act 1966*. This includes medication selection, recording, labelling, handover to patient/carer, verbal counselling and provision of information sheets and/or Consumer Medicines Information. In this document: a) To 'administer' means the supervised administration of a medication in a health facility. b) To 'supply' means the provision of a medication for take-home use.
Registered Nurse	A nurse or midwife who (i) is on the register of the Nursing and Midwifery Board of Australia, (ii) has completed a 3-year nursing degree from a higher education institution or equivalent from a recognised hospital-based program, and (iii) fulfils all of the ongoing requirements of the Nursing and Midwifery Board of Australia's registration standards.
General Practitioner (GP)	Refers in this document to a GP who has a Visiting Medical Officer (VMO) appointment at a health facility, usually in a rural or remote area, and is a Medical Officer for that site.
Local Facilitator	A key role within the local NDEC governance framework which is usually a senior nurse at a site or LHD level. The role is responsible for ensuring that implementation sites meet the requirements of the NDEC Education and Accreditation Framework.

1.3 Legal and legislative framework

Clauses 170 and 171 of the Poisons and Therapeutic Goods Regulation 2008 allow the Secretary of Health to authorise (for the purposes of the Act) a particular person (by means of an instrument in writing given to the person) or a specified class of persons (by means of an instrument published in a manner approved by the Secretary) to supply Schedule 4 medications (restricted substances) under clause 53 of the Regulation and Schedule 2 and Schedule 3 medications under clause 17 of the Regulation. The authorisation applies only to the listed medications for the Standing Orders included in this policy.

1.4 Nurse Delegated Emergency Care

The Nurse Delegated Emergency Care (NDEC) patient care model has been developed to support rural and remote facilities provide care for patients presenting to Emergency Departments with low-risk, low-acuity conditions. Under NDEC the care of these patients is managed entirely by an appropriately trained and credentialed Registered Nurse (RN), under the explicit delegation of the site Medical Officer/s. To be credentialed to practice NDEC, RNs must fulfil the requirements of the NDEC Education and Accreditation Framework, including satisfactory completion of the education modules, and competency assessment.

Rationale for development of the NDEC Model

NDEC has been developed to improve the care of patients presenting to Emergency Departments with minor illnesses/injuries, and to support the rural clinical workforce in small Emergency Departments. The Model defines the components of safe and quality care for selected low-acuity conditions, and outlines education, credentialing and quality assurance processes so that an episode of care may be delivered entirely by an NDEC credentialed nurse. A robust clinical framework supports care provision when the patient presents, even when no medical officer is available at the site, under a delegated care model.

Key features of NDEC include:

- Assessment of the patient against strict inclusion and exclusion criteria.
- If inclusion criteria are not met, a medical review/phone consult must be sought.

- If the patient is suitable for management under the NDEC model, the RN manages the episode of care using specified:
  - Nurse Management Guidelines
  - Medication Standing Orders
  - Patient Factsheets.
- Nurses may provide interventions to manage symptom relief. The patient will then be discharged with specific follow up instructions in accordance with **PD2014_025** Departure of Emergency Department Patients.
- The patient is asked to attend follow up with the local GP at their rooms or the ED. The patient will receive a follow up phone call from an NDEC RN within 24 hours of Emergency Department visit to check that symptoms have improved.
- The NDEC model may operate in a facility 24/7, or as an after-hours model, or when no GP is available.
- If at any stage the patient's condition deteriorates and they are deemed no longer suitable for NDEC, the RN is required to revert to "usual care" and contact a the medical officer for further review.
- RNs can opt out of the model if they are concerned about a patient's condition.

1.5 Implementation Requirements

Key prerequisites for the implementation of the NDEC include:

- Express support of care delegation and co-operation in implementing the model from the site General Practitioner(s), Health Service Manager/Nurse Unit Manager and Local Health District Executive is required.
- Submission of NDEC Site Nomination Form to the Agency for Clinical Innovation Emergency Care Institute NSW (ECI). Endorsement by the NDEC Steering Committee is required for sites to work with the ECI to support implementation.
- Pre-implementation education needs assessment.
- Pre-implementation "Snapshot" audit of Emergency Department (ED) presentations pertinent to NDEC.
- Pre-implementation staff survey.
- Pre-implementation patient survey.
- Pre-implementation audit covering existing clinical practice standards related to:
  - Patient assessment
  - Patient symptom management
  - Disposition practices
  - Documentation; and
  - Nursing staff competency and confidence with core nursing skills required for NDEC implementation.
- Establishment of a local governance structure.
- RN training and credentialing in the NDEC Model of Care (MoC) nursing skills.
- Review and local endorsement of Nurse Management Guidelines (NMG).
- Endorsement of Standing Orders by Local Health District (LHD) Drug and Therapeutic Committee.
- Adaption of the paper based NDEC documentation to FirstNet electronic medical record (eMR) if applicable/
- Authorisation and communication of the NDEC "go-live" decision.

1.6 Credentialing of Registered Nurses for NDEC

Operating the NDEC model is within the scope of practice of a Registered Nurse. To be credentialed to practice NDEC, RNs must fulfil the requirements of the NDEC Education and Accreditation Framework, including satisfactory completion of the education and competency assessment. Qualification or endorsement as an Advanced Practice Nurse or Nurse Practitioner is not required.

Credentialing requires NDEC RNs to demonstrate ongoing evidence of recency of practice using NDEC, and ongoing safe use of NDEC through clinical practice audits.

In addition to specific training requirements, the following mandatory education must be completed:

- Emergency Triage Education Kit program (or equivalent).
- NSW Ministry of Health Acute Paediatric Clinical Practice Guidelines on-line.
- Between the Flags, D.E.T.E.C.T. & D.E.T.E.C.T Jnr.
- NDEC mapped core skills review.

Further information can be found in the NDEC Education and Accreditation Framework: **http://www.ecinsw.com.au/sites/default/files/field/file/NDEC%20RN%20Education%20and%20Accreditation%20Framework.PDF**

1.7 Review Process

The ECI will conduct regular reviews of the NDEC clinical practice materials through its Clinical Advisory Committee, and NDEC Steering Committee, in line with its standard review schedule for clinical tools. Implementation sites can initiate review or revision of NDEC materials through ECI clinical governance processes. NDEC Patient Care Resources have been reviewed by the:

- ECI Executive Committee.
- NDEC Steering Committee.
- CEC Medication Safety Expert Advisory Committee.
- LHD Drug and Therapeutics Committees.

The ECI will provide NDEC sites with appropriate resources and education as reviews and updates occur. Individual sites will be responsible for updating local resources and completing reviews of local Standing Orders in accordance with **PD2013_043** *Medication Handling in NSW Public Health Facilities*.

2 IMPLEMENTATION OF STATEWIDE STANDING ORDERS FOR NURSE DELEGATED EMERGENCY CARE

When a state-wide Standing Order is applied, Public Health Organisation Executives are to ensure:

- A Registered Nurse operating under this standing order is aware of their responsibility to:
  - Comply with the requirements of the NDEC Education and Accreditation Framework.
  - Determine whether the patient meets the criteria for the standing order.
  - Recognise patients who do not meet inclusion criteria for NDEC and refer them to a medical officer for clinical care.
  - Determine any known allergies, hypersensitivity to the medication or contra-indications to treatment, and where these are identified, contact the medical officer to discuss appropriate management.

- Explain the medication and its purpose to the patient (or guardian).
- Obtain patient/guardian consent for treatment as appropriate.
- Document all assessments and details relating to the supply of medication as detailed below.
- Attend yearly training in cardio-pulmonary resuscitation, including review of the protocol for the administration of adrenaline.

- Medications are supplied by the Pharmacy Department to the Emergency Department pre-labelled in accordance with **PD2013_043** Medication Handling in NSW Public Health Facilities.
- All medication that is supplied for dosing at a later time is pre-prepared and labelled by a pharmacist, or, in circumstances where pre-prepared packs are not available, is labelled by the clinician supplying the medication to the patient. Labelling must include the name(s), strength(s), and active ingredient(s) of the medication and the directions for use, including duration of use, ancillary labels and other required information. The patient's name and date of supply must be hand-written on the label by the nurse at the time of supply. Any pre-prepared label must be initialled by the nurse supplying the medication to the patient. Additional information that must also be supplied includes the relevant medication factsheet.
- A Medical Officer is able to be contacted to provide advice to the Registered Nurse who is providing medication under the standing order.
- A Medical Officer will review, sign and date records within 24 hours to confirm that medications were administered or supplied in accordance with the standing order.
- All records relating to the administration of medication are retained in accordance with the State Records Authority General Retention and Disposal Authority for Public Health Services: Patient/Client Records (GDA 17).
- Where possible, medications are stored as Imprest stock Schedule 2, 3 and 4 (but not Schedule 4D) in ED or ED after-hours store – see sections 6.3.3 and 6.8 of **PD2013_043**.

3 MEDICATIONS FOR THE MANAGEMENT OF SYMPTOMS ASSOCIATED WITH MINOR INJURIES/ILLNESSES DEFINED IN THE NURSE DELEGATED EMERGENCY CARE PATIENT CARE MODEL

3.1 Purpose

This standing order authorises a registered nurse, who has demonstrated compliance with requirements set out in Section 2, to administer and/or supply specified medications for the purpose of treatment of defined low-risk conditions specified under the Nurse Delegated Emergency Care patient care model. It also sets out procedures for ordering, storing, administering and supplying the medications.

If the Registered Nurse applying the standing order has any concerns regarding patient safety for provision of the medication (e.g. people with significant chronic illness or immunosuppression), the nurse should arrange for the responsible Medical Officer, whether in the hospital or on call, to assess the patient so appropriate administration of medication can occur as soon as possible. Where no medical officer is on call, the usual procedure designated by the hospital executive for obtaining medical officer advice will apply.

3.2 Scope

The following Standing Orders are to be used within the framework of the Nurse Delegated Emergency Care (NDEC) patient care model. These Standing Orders are not approved for use outside of the NDEC model of care, even if such use may be covered by other NSW Ministry of Health or LHD specific policy or protocol.

These Standing Orders are not intended to replace clinical judgement and expertise.

3.3 Additional points to be noted for all standing orders:

- Note on drug Trade Names: where applicable, every attempt has been made to list Australian available unique trade names that do not articulate the primary medication within the trade name (e.g. Heron Paracetamol is not listed). To confirm specific constituent components, consult medication packaging, product information such as MIMS Online® or pharmacological resource such as the Australian Medicines Handbook (**https://amhonline.amh.net.au.acs.hcn.com.au** .
- Note on listed Indications: The listed indications are for the NDEC context only. No attempt has been made to present a full scope of indications for each drug. For full medication information, consult an appropriate pharmacological resource like MIMS Online®.
- Note on listed Contraindications: Any RED FLAG listed within a specific Nursing Management Guideline is a contraindication for medication administration under NDEC. In addition, for the purpose of nurse administration of medication within NDEC, relative contraindications are treated as absolute contraindications; and a medical review will be required prior to medication administration.
- Note on listed Side Effects: The management of side effects from administration of any medications under the following Standing Orders should occur as per usual practice. For severe reactions, including anaphylaxis, care should be in accordance with NSW Rural Adult or Paediatric Emergency Clinical Guidelines. Should a patient develop any concerning side effects, a medical officer should be contacted.

3.3 Standing Order for supply of Amethocaine Hyrochloride eye drops

TITLE	Standing order for Amethocaine Hydrochloride eye drops
Trade Name(s)	Minims Amethocaine Eye Drops
Presentation [1]	Clear, colourless sterile eye drops 0.5% (5mg/mL), or 1% (10mg/mL) Single patient, single use
Indication	Production of local anaesthesia in the eye. Reduces pain to facilitate adequate eye exam.
Contraindications[1]	Current use of sulphur based antibiotics (sulphonamides)
Precautions[1]	Instruct patient not to rub or touch the affected eye while anaesthesia persists. Should be used with caution in children, as this group is more susceptible to drug effects.
Dose	1 drop into affected eye/s, repeated every 5 minutes if necessary. Up to 3 drops may be used for foreign body removal.
Dose frequency[1]	Single dose
Administration[1]	**To be administered in hospital only.** Ensure contact lenses are removed Instil dose into affected eye/s (see Emergency Eye Manual pg. 26 for eye drop instructions) **http://www.aci.health.nsw.gov.au/__data/assets/pdf_file/0013/155011/eye_manual.pdf** Instruct patient not to rub or touch the affected eye while anaesthesia persists
Storage	Refrigerate and store out of patient and public access, preferably in a locked room or a locked cabinet securely attached to the wall or floor – see **PD2013_043**.
Adverse effects[1]	• On instillation an initial burning sensation may be experienced. This may last for up to 30 seconds. • Blurred vision, lacrimation (watery eyes) • Persistent use may result in corneal damage Never give patient anaesthetic drops to take home
Nursing Accreditation Requirements	An RN whose competency to practice Nurse Delegated Emergency Care and to comply with this Standing Order has been assessed and approved by a *Local Facilitator*, in accordance with the NDEC Education and Accreditation Framework.
Documentation	Administration record is to be documented by the administering nurse. Document on the "once only" section of the appropriate medication chart. The record of administration must be checked and countersigned by a medical officer within 24 hours of initial administration.
Related Documents	NDEC Nurse Management Guideline: Eye Problems **http://www.ecinsw.com.au/node/270** NDEC Nurse Management Guideline: Pain **http://www.ecinsw.com.au/node/275**

Date approved by XXX LHD Drugs and Therapeutics Committee: **Review Date:**	**Medical Officer Name:** **Signature:**

[1] The drug information provided is to act as a guide only, for further information reference should be made to the full product info available on MIMS or the Australian Medicines Handbook <accessible in NSW Health facilities via CIAP: > If contraindications, precautions or interactions are present refer to MO before administration

3.4 Standing Order for supply of Cephalexin

TITLE	Standing order for Cephalexin
Trade Name(s)	Cefalexin, Cephatrust, Cilex, Ialex, Ibilex, Keflex, Rancef
Presentation [1]	Tablet/capsules containing 250mg; 500mg Oral suspension for reconstitution 125mg/5mL; 250mg/5mL
Indication	Antibiotic treatment for suspected UTI by clinical history and positive U/A (positive leukocytes and/or nitrites)
Contraindications[1]	Known allergy to cephalosporin group of antibiotics or previous history of a major allergy to penicillins
Precautions[1]	Nil specific
Dose and frequency[1]	**Adults** 500mg first dose only* **or** 500mg every 12 hours for 5 days* **Children > 12 years** 12.5mg/kg up to 500mg first dose only* **or** 12.5mg/kg up to 500mg every 6 hours for 5 days* ***Refer to local facility NDEC guidelines regarding administration of first dose versus dispensing a full course of antibiotic via this Standing Order.**
Administration and Supply[1]	**May be administered in hospital and full course of medication may be supplied via pre-labelled stock for use outside the hospital.** Oral tablet/capsule Oral suspension – consult product information for reconstitution instructions. Store in fridge once reconstituted (discard unused portion after 14 days).
Storage	Store out of patient and public access, preferably in a locked room or a locked cabinet securely attached to the wall or floor – see **PD2013_043**.
Adverse effects[1]	Gastrointestinal symptoms Hypersensitivity reactions
Nursing Accreditation Requirements	An RN whose competency to practice Nurse Delegated Emergency Care and to comply with this Standing Order has been assessed and approved by a *Local Facilitator,* in accordance with the NDEC Education and Accreditation Framework.
Documentation	Administration and supply record is to be documented by the administering nurse. Document first dose and supply of the full course in the "once only" section of the medication chart. The record of administration and supply must be checked and countersigned by a medical officer within 24 hours of initial administration.
Related Documents	NDEC Nurse Management Guideline: Urinary Symptoms **http://www.ecinsw.com.au/node/278** NDEC Nurse Management Guideline: Pain **http://www.ecinsw.com.au/node/275**

Local Standing Order Authorisation:

Date approved by XXX LHD Drugs and Therapeutics Committee: **Review Date:**	**Medical Officer Name:** **Signature:**

[1] The drug information provided is to act as a guide only, for further information reference should be made to the full product info available on MIMS or the Australian Medicines Handbook <accessible in NSW Health facilities via CIAP: > If contraindications, precautions or interactions are present refer to MO before administration

3.5 Standing Order for supply of Chloramphenicol eye drops

TITLE	Standing order for Chloramphenicol eye drops Minims Chloramphenicol 0.5% Eye Drops
Trade Name(s)	Chloromycetin Eye Drops; Chlorsig Eye drops; Minims Chloramphenicol 0.5% Eye Drops
Presentation [1]	Clear to slightly hazy, colourless, sterile eye drops 0.5% (5mg/mL).
Indication	Prophylactic antibiotic coverage against bacterial infection in superficial ocular injuries including corneal foreign body and "welder's flash" burn
Contraindications[1]	• Known allergy to chloramphenicol • Restriction of eye movement/abnormal pupils cloudy cornea • Chronic eye disease (e.g. glaucoma) • Recent (within 6 months) eye surgery, including laser surgery
Precautions[1]	Patients should be instructed to cease using contact lenses during treatment and seek GP or optometrist advice prior to recommencing use.
Dose[1]	1 drop into affected eye/s
Dose frequency[1]	Every 2–4 hours for 2 days; then 1 drop 4 times daily for 5 days
Administration and Supply[1]	**May be administered in hospital and full course of medication may be supplied via pre-labelled stock for use outside the hospital.** Single patient use (discard after 1 month of opening) Ensure contact lenses are removed Instil dose into affected eye/s (see Emergency Eye Manual pg. 26 for eye drop instructions) **http://www.aci.health.nsw.gov.au/__data/assets/pdf_file/0013/155011/eye_manual.pdf**
Storage	Refrigerate and store out of patient and public access, preferably in a locked room or a locked cabinet securely attached to the wall or floor – see **PD2013_043**.
Adverse effects[1]	Local ocular irritation; burning or itching. Allergic type reactions. Unpleasant taste. Blurred vision.
Nursing Accreditation Requirements	An RN whose competency to practice Nurse Delegated Emergency Care and to comply with this Standing Order has been assessed and approved by a *Local Facilitator,* in accordance with the NDEC Education and Accreditation Framework.
Documentation	Administration and supply record is to be documented by the administering nurse. Document first dose and supply of the full course in the "once only" section of the medication chart. The record of administration must be checked and countersigned by a medical officer within 24 hours of initial administration.

3.6 Standing Order for supply of Fluorescein eye drops

TITLE	Standing order for Fluorescein eye drops
Trade Name(s)	Minims Fluorescein Eye Drops
Presentation [1]	Sterile ophthalmic solution 2% (20mg/mL) or 1% (10mg/mL). Single patient, single use.
Indication	Diagnostic aid during eye exams.
Contraindications[1]	Nil recorded
Precautions[1]	Ensure single use/single patient regime maintained; significant risk of iatrogenic ocular infection if solution reused. Advise patient to avoid rubbing eyes and avoid expose to dust. Advise patient may temporarily stain skin, urine, tears, nasal secretions yellow; may permanently stain soft contact lenses and clothing.
Dose[1]	Use sufficient solution to apply stain to damaged area – generally 1-2 drops in each eye. Excess can be washed away with sterile saline solution.
Dose frequency[1]	Single dose
Administration[1]	**To be administered in hospital only.** • Ensure contact lens are removed • Instil solution into affected eye/s • (see Emergency Eye Manual pg. 26 for eye drop instructions **http://www.aci.health.nsw.gov.au/__data/assets/pdf_file/0013/155011/eye_manual.pdf**) • Use cobalt blue light source for assessment • Stain does not show up on a normal cornea. Corneal abrasions or ulcers are stained a bright green. Foreign bodies are surrounded by a green ring. Conjunctival abrasions are also stained.
Storage	Refrigerate and store out of patient and public access, preferably in a locked room or a locked cabinet securely attached to the wall or floor – see **PD2013_043**.
Adverse effects[1]	May cause blurred vision – caution driving.
Nursing Accreditation Requirements	An RN whose competency to practice Nurse Delegated Emergency Care and to comply with this Standing Order has been assessed and approved by a *Local Facilitator,* in accordance with the NDEC Education and Accreditation Framework.
Documentation	Administration record is to be documented by the administering nurse. Document on the "once only" section of the appropriate medication chart. The record of administration must be checked and countersigned by a medical officer within 24 hours of initial administration.
Related Documents	NDEC Nurse Management Guideline: Eye Problems **http://www.ecinsw.com.au/node/270** NDEC Nurse Management Guideline: Pain **http://www.ecinsw.com.au/node/275**

3.7 Standing Order for supply of Ibuprofen

TITLE	Standing order for Ibuprofen
Trade Name(s)	Advil, Brufen, Bugesic, Dimetapp, Heron Blue, Nurofen, Panafen, ProVen, Rafen
Presentation [1]	Tablets/capsules containing 200mg Suspension • 200mg/5mL • 100mg/5mL • 100mg/100mL (Note: Some ibuprofen preparations contain codeine, phenylephrine or pseudoephedrine combinations – this Standing Order is for ibuprofen only. Other preparation combinations are not covered).
Indication	Analgesia for the treatment of mild to moderate pain (any cause). Corresponding pain score may range from 1 – 6.
Contraindications[1]	• History of allergy to aspirin or other NSAIDs • Concurrent antiplatelet (including low dose aspirin) or anticoagulant use • History of, or likelihood of, active peptic ulcer disease or GI bleeding • History of, or likelihood of, liver, kidney or cardiovascular disease, including hypertension, heart failure, stroke, myocardial infarct • History of asthma or hypertension • Current or possible pregnancy • Breast feeding mothers • Patients >65yrs with multiple comorbidities and on multiple medications • Dehydration • Concurrent use of diuretics, ACE inhibitors or angiotensin receptor blockers
Precautions[1]	Nil specific – assess effectiveness by repeating pain assessment 30 – 60 minutes post administration
Dose[1]	**Elderly – 200mg per dose** **Adults – 200 -** 400mg per dose **Children -** 10mg / kg up to 400mg per dose
Dose frequency[1]	**Adults -** 4-6 hourly (maximum 3 doses/24hrs) **Children -** 6-8 hourly (maximum 3 doses/24hrs)
Administration and Supply[1]	**May be administered in hospital and supplied via pre-labelled stock for use outside the hospital in a take-home pack of no more than 10 tablets. Advise patient to consult a doctor about using for more than 2 days.** Oral tablet/capsule or suspension syrup
Storage	Store out of patient and public access, preferably in a locked room or a locked cabinet securely attached to the wall or floor – see **PD2013_043**.
Adverse effects[1]	• Gastrointestinal symptoms • Hypersensitivity reactions • Longer term use may exacerbate cardiac or renal disease
Nursing Accreditation Requirements	An RN whose competency to practice Nurse Delegated Emergency Care and to comply with this Standing Order has been assessed and approved by a *Local Facilitator*, in accordance with the NDEC Education and Accreditation Framework.
Documentation	Administration record and supply is to be documented by the administering nurse. Document first dose and supply (if applicable) on the "once only" section of the appropriate medication chart. The record of administration must be checked and countersigned by a medical officer within 24 hours of initial administration.

3.8 Standing Order for supply of Lignocaine 1%

TITLE	Standing order for Lignocaine 1%
Trade Name(s)	Lignocaine, Xylocaine (Plain)
Presentation [1]	Ampoule containing clear, colourless, sterile liquid. Specific ampoule type depends on manufacturer however, contains either **50mg/5mL** **200mg/20mL**
Indication	To facilitate the removal of a crawling insect from the ear canal by gentle aural instillation.
Contraindications[1]	Known perforation, bleeding or obvious trauma to external auditory canal Inability for patient to stay still/immobilised during instillation
Precautions[1]	Nil specific
Dose	Single dose (1% lignocaine) for adults and children > 10kgs. Maximum dose (based on 3mg/kg) • ≥ 10kg 3mL
Dose frequency[1]	Single dose
Administration[1]	**To be administered in hospital only.** The aim of administration is to cover/drown the insect. Gently instil into the ear to achieve desired outcome. Note if the insect is still alive, it may rapidly crawl out of the auditory canal upon commencement of instillation.
Storage	Store out of patient and public access, preferably in a locked room or a locked cabinet securely attached to the wall or floor – see **PD2013_043**.
Adverse effects[1]	If instilled in an ear with a perforated membrane, middle ear type symptoms may develop (vertigo etc.)
Nursing Accreditation Requirements	An RN whose competency to practice Nurse Delegated Emergency Care and to comply with this Standing Order has been assessed and approved by a *Local Facilitator*, in accordance with the NDEC Education and Accreditation Framework.
Documentation	Administration record is to be documented by the administering nurse. Document on the "once only" section of the appropriate medication chart. The record of administration must be checked and countersigned by a medical officer within 24 hours of initial administration.

3.9 Standing Order for supply of Loratadine

TITLE	Standing order for Loratadine
Trade Name(s)	Alledine; Allerdyne; Allereze; Claratyne; Lorano; Lorapaed; Lorastyne
Presentation [1]	**Tablet** containing 10mg **Syrup** containing 1mg/mL (Note: Some loratadine preparations contain a pseudoephedrine combination – this Standing Order is for loratadine only. Other preparation combinations are not covered.)
Indication	Minor urticarial rashes of probably allergen origin
Contraindications[1]	• Allergy to sodium benzoate (preservative in syrup form) • Severe liver disease
Precautions[1]	Nil specific
Dose[1]	**Adults/children aged ≥ 12 years** • 10mg (1 tablet) orally, daily **Children** • 2 – 12 years o Body weight > 30kg; 10mg (10mL or 1 tablet) orally, daily o Body weight ≤ 30kg; 5mg (5mL) orally, daily • 1 – 2 years o 2.5mg (2.5mL) orally, daily
Dose frequency[1]	Daily
Administration[1]	**To be administered in hospital only.** Oral tablet/syrup
Storage	Must be stored out of patient and public access, preferably in a locked room or a locked cabinet securely attached to the wall or floor – see **PD2013_043**.
Adverse effects[1]	May rarely cause drowsiness, fatigue, headache, nausea, dry mouth especially in the elderly.
Nursing Accreditation Requirements	An RN whose competency to practice Nurse Delegated Emergency Care and to comply with this Standing Order has been assessed and approved by a *Local Facilitator,* in accordance with the NDEC Education and Accreditation Framework.
Documentation	Administration record is to be documented by the administering nurse. Document on the "once only" section of the appropriate medication chart. The record of administration must be checked and countersigned by a medical officer within 24 hours of initial administration.

3.10 Standing Order for supply of Metoclopramide

TITLE	Standing order for Metoclopramide
Trade Name(s)	Maxolon; Pramin
Presentation [1]	**Tablets** containing 10mg **Parenteral solution** containing 5mg/mL, 2mL (Note: Some metoclopramide preparations contain a paracetamol combination – this Standing Order is for metoclopramide only. Other preparation combinations are not
Indication	Relief of nausea and/or vomiting
Contraindications[1]	• Age < 20 years • Hx epilepsy • Previous reactions to metoclopramide (including dystonic reactions) • Impaired renal or hepatic function
Precautions[1]	Nil specific
Dose[1]	Adults ≥ 20 years • 10mg oral tablet/OR by intramuscular injection If patient weighs 30-60kg • 5mg oral tablet/OR by intramuscular injection
Dose frequency[1]	Can be given three times a day (every 8 hours)
Administration[1]	**To be administered in hospital only.** Oral tablet OR by intramuscular injection
Storage	Must be stored out of patient and public access, preferably in a locked room or a locked cabinet securely attached to the wall or floor – see **PD2013_043**.
Adverse effects[1]	Dystonic type reactions (involuntary muscle contractions and abnormal postures of the trunk, neck, face, or extremities), akathisia, drowsiness, dizziness, headache.
Nursing Accreditation Requirements	An RN whose competency to practice Nurse Delegated Emergency Care and to comply with this Standing Order has been assessed and approved by a *Local Facilitator*, in accordance with the NDEC Education and Accreditation Framework.
Documentation	Administration record is to be documented by the administering nurse. Document on the "once only" section of the appropriate medication chart. The record of administration must be checked and countersigned by a medical officer within 24 hours of initial administration.

3.11 Standing Order for supply of Ondansetron

TITLE	Standing order for Ondansetron
Trade Name(s)	Ondaz; Zifojim Zofran, Zondan
Presentation [1]	**Wafer (fast dissolving) or oral tablet** containing 4mg or 8mg
Indication	Relief of nausea and/or vomiting
Contraindications[1]	• Concomitant use with apomorphine • Children < 2 years • Cardiac disease, particularly conduction anomalies • Hypokalaemia
Precautions[1]	Nil specific
Dose[1]	Adults and children ≥ 2 years • 4mg single dose (tablet or wafer)
Dose frequency[1]	Single dose
Administration[1]	**To be administered in hospital only.** Wafer is placed on top of the tongue where it dissolves within seconds and is swallowed Or Tablet orally
Storage	Must be stored out of patient and public access, preferably in a locked room or a locked cabinet securely attached to the wall or floor – see **PD2013_043**.
Adverse effects[1]	Headache, sensation of warmth or flushing, dizziness, hypotension, hiccups, arrhythmias, chest pain, seizures.
Nursing Accreditation Requirements	An RN whose competency to practice Nurse Delegated Emergency Care and to comply with this Standing Order has been assessed and approved by a *Local Facilitator*, in accordance with the NDEC Education and Accreditation Framework.
Documentation	Administration record is to be documented by the administering nurse. Document on the "once only" section of the appropriate medication chart. The record of administration must be checked and countersigned by a medical officer within 24 hours of initial administration.

3.12 Standing Order for supply of Oral Rehydration Solution

TITLE	Standing order for Oral Rehydration Solution
Trade Name(s)	E-Lyte; Gastrolyte; Gold Cross Gluco-lyte; HYDRAlyte, O.R.S.; Pedialyte; Repalyte; Restore O.R.S.
Presentation[1]	Oral Rehydration Solutions are generally available in 4 forms; • Soluble powder • Effervescent dissolvable tablet • Pre-made solution • Ice blocks. Composition of the available Oral Rehydration Solutions vary. For an overview comparison see NSW Health Infants and Children – Acute Management of Gastroenteritis. **http://www0.health.nsw.gov.au/policies/gl/2014/GL2014_024.html**
Indication	Oral correction of fluid and electrolyte loss in infants, children and adults as a result of vomiting and/or diarrhoea
Contraindications[1]	Possible surgical intervention and/or a requirement to remain 'nil by mouth'
Precautions[1]	Strict fluid balance record. Input should exceed output. Further vomiting ≠ failed trial of fluid – worsening dehydration assessment status = failed trial of fluid
Dose[1]	0.5mL/kg
Dose frequency[1]	Every 5 minutes
Administration[1]	**To be administered in hospital only.** If required, reconstitute specific Oral Rehydration Solution as per manufactures instructions. Instruct patient/carer to administer Oral Rehydration Solution in small, frequent amounts (0.5mL/kg every 5 minutes). Provide patient/carer with appropriate measuring/administration equipment; syringe, measuring cup etc.
Storage	Must be stored out of patient and public access, preferably in a locked room or a locked cabinet securely attached to the wall or floor – see **PD2013_043**.
Adverse effects[1]	No clinically significant side-effects
Nursing Accreditation Requirements	An RN whose competency to practice Nurse Delegated Emergency Care and to comply with this Standing Order has been assessed and approved by a *Local Facilitator,* in accordance with the NDEC Education and Accreditation Framework.
Documentation	Administration record is to be documented by the administering nurse. Document on the "once only" section of the appropriate medication chart. The record of administration must be checked and countersigned by a medical officer within 24 hours of initial administration.

3.13 Standing Order for supply of Paracetamol

TITLE	Standing order for Paracetamol
Trade Name(s)	APO, Dimetapp, Dymadon, Febridol, Lemsip, Panadol, Panamax, Paralgin (Note: Some paracetamol preparations contain combinations of caffeine, chlorpheniramine, codeine, dextromethorphan, dextropropoxyphene, doxylamine, metoclopramide, orphenadrine, phenylephrine, pseudoephedrine, and/or triprolidine. This Standing Order is for paracetamol only).
Presentation [1]	Tablets/capsules/chewable tablets/soluble tablets or soluble powder: containing 120mg, 250mg, 500mg, 600mg, 1000mg Suspension: • 50mg/mL • 100mg/mL • 120mg/5mL • 240mg/5mL (Note: paracetamol is available as modified/sustained release (665mg) tablets, suppositories and intravenous infusions. This Standing Order is for oral non-modified release preparations only).
Indication	Analgesia for the treatment of mild to moderate pain (any cause). Corresponding pain score may range from 1 – 6
Contraindications[1]	• Known allergy to paracetamol or specific preparation components • Impaired liver function including current alcohol dependence • Previous dose 15mg/kg (1g adult dose) of paracetamol within 4 hours • Cumulative dose 60mg/kg (4g adult dose) of paracetamol within preceding 24 hours • Avoid soluble preparations (due to high sodium content) in heart failure/ hypertension/where low sodium intake is indicated
Precautions[1]	Nil specific – assess effectiveness by repeating pain assessment 30 – 60 minutes post administration
Dose[1]	**Adults and children > 12 years** • 1g **Children > 1 month** • 15mg / kg (maximum 1g) (maximum 60mg / kg / 24 hours – not more than 4g per 24 hours)
Dose frequency[1]	**Adults and children > 12 years** • every 4 – 6 hours (maximum 4g per 24 hours) **Children > 3 months** • every 4 – 6 hours (maximum 60mg/kg/24 hours – not more than 4g per 24 hours)
Administration and Supply[1]	**May be administered in hospital and supplied via pre-labelled stock for use outside the hospital in a take-home pack of no more than 10 tablets.** Prepare and administer appropriate oral dose based on product concentration, product instructions and intended dose.
Storage	Must be stored out of patient and public access, preferably in a locked room or a locked cabinet securely attached to the wall or floor – see **PD2013_043**.
Adverse effects[1]	Rare – though hypersensitivity/allergic type reactions are possible
Nursing Accreditation Requirements	An RN whose competency to practice Nurse Delegated Emergency Care and to comply with this Standing Order has been assessed and approved by a *Local Facilitator*, in accordance with the NDEC Education and Accreditation Framework.
Documentation	Administration and supply record is to be documented by the administering nurse. Document first dose and supply of take home pack (if applicable) on the "once only" section of the appropriate medication chart. The record of administration must be checked and countersigned by a medical officer within 24 hours of initial administration.

3.14 Standing Order for supply of Paracetamol 500mg/Codeine 8mg

TITLE	Standing order for Paracetamol 500mg/Codeine 8mg **(adults only)**
Trade Name(s)	Codapane, Panamax Co, Panadeine, Panalgesic (Note: Paracetamol/codeine preparations are available in multiple dose ratios. Some preparations also contain combinations of doxylamine. This Standing Order is for paracetamol 500mg/codeine 8mg only.)
Presentation [1]	Tablet/soluble tablet containing 500mg paracetamol/8mg codeine
Indication	Analgesia for the treatment of moderate pain **in adults** (any cause). Corresponding pain score may range from 4 – 6.
Contraindications[1]	• Known allergy to paracetamol, codeine or specific preparation components • Breastfeeding mothers • Impaired liver function including current alcohol dependence • Impaired renal function • Decreased respiratory reserve • Previous paracetamol dose (≥ 1g) within last 4 hours • Cumulative dose of paracetamol ≥ 4g within last 24 hours • Avoid soluble preparations (due to high sodium content) in heart failure/ hypertension/where low sodium intake is indicated
Precautions[1]	Nil specific – assess effectiveness by repeating pain assessment 30 – 60 minutes post administration.
Dose[1]	2 tablets (paracetamol 500mg / codeine 8mg)
Dose frequency[1]	4 – 6 hourly up to 8 tablets (4g paracetamol total) per 24 hours
Administration[1]	**To be administered in hospital only.** Tablet or soluble tablet orally
Storage	Must be stored out of patient and public access, preferably in a locked room or a locked cabinet securely attached to the wall or floor – see **PD2013_043**.
Adverse effects[1]	• Drowsiness and mental impairment • Gastrointestinal symptoms • Rare – though hypersensitivity/allergic type reactions are possible for both paracetamol and codeine
Nursing Accreditation Requirements	An RN whose competency to practice Nurse Delegated Emergency Care and to comply with this Standing Order has been assessed and approved by a *Local Facilitator*, in accordance with the NDEC Education and Accreditation Framework.
Documentation	Administration record is to be documented by the administering nurse. Document on the "once only" section of the appropriate medication chart. The record of administration must be checked and countersigned by a medical officer within 24 hours of initial administration.

3.15 Standing Order for supply of Sodium Citrotartrate

TITLE	Standing order for Sodium Citrotartrate **(adults only)**
Trade Name(s)	Citralite, Citravescent, Ural
Presentation[1]	Powder for reconstitution containing 3.7g or 4g sodium citrotartrate
Indication	Symptom management of dysuria **in adult patients only**
Contraindications[1]	• Renal failure/renal impairment • Hypernatraemia/heart failure/hypertension / peripheral or pulmonary oedema/ where low sodium intake is indicated • Pregnancy • Breastfeeding mothers
Precautions[1]	Nil specific
Dose[1]	1 – 2 reconstituted sachets (3.7 – 8g)
Dose frequency[1]	3 – 4 times a day
Administration[1]	**May be administered in hospital and supplied via pre-labelled stock for use outside the hospital. (Patient information sheet must be included.)** Reconstitute powder as directed by product packaging.
Storage	Must be stored out of patient and public access, preferably in a locked room or a locked cabinet securely attached to the wall or floor – see **PD2013_043**.
Adverse effects[1]	• Mild laxative effect • Prolonged use may cause systematic alkalosis and/or hypernatraemia
Nursing Accreditation Requirements	An RN whose competency to practice Nurse Delegated Emergency Care and to comply with this Standing Order has been assessed and approved by a *Local Facilitator*, in accordance with the NDEC Education and Accreditation Framework.
Documentation	Administration record is to be documented by the administering nurse. Document on the "once only" section of the appropriate medication chart. The record of administration must be checked and countersigned by a medical officer within 24 hours of initial administration.

3.16 Standing Order for supply of Tetanus Toxoid

TITLE	Standing order for Tetanus Toxoid
Trade Name(s)	*Tetanus toxoid is only available in combination with other antigens.* Adacel (Diphtheria toxoid + Tetanus toxoid + Pertussis vaccine), ADT (Diphtheria toxoid + Tetanus toxoid), Boostrix (Diphtheria toxoid + Tetanus toxoid + Pertussis vaccine), Tripacel Injection (Diphtheria toxoid + Tetanus toxoid + Pertussis vaccine)
Presentation [1]	0.5mL in needleless prefilled syringe for injection
Indication	• All wounds in patients that have not had a booster in the last 10 years • All wounds <u>other than clean minor cuts</u> in adults who have not received a booster in the last 5 years • All wounds where <u>vaccination history is uncertain or less than 3 doses of tetanus toxoid.</u> *Ensure this is noted on discharge paperwork. The patient will require further immunoglobulin as part of routine follow-up*. (see table below)
Contraindications[1]	Previous anaphylaxis following a previous dose of tetanus-containing vaccine or any vaccine. Consider Tetanus Immunoglobulin (TIG) TIG for tetanus prone wounds for persons with history of severe adverse event following tetanus vaccination
Precautions[1]	Observe patient until at least 15 minutes post administration for development of allergic type reactions. Notify medical officer immediately if allergic type symptoms develop.
Dose[1]	0.5mL of a tetanus-containing vaccine in combination with diphtheria toxoid. Refer to medication packaging for specific dosages
Dose frequency[1]	Once only
Administration[1]	**To be administered in hospital only.** Shake thoroughly before use. 0.5mL given as a slow intramuscular injection
Storage	Refrigerate, store between +2^{0}C to +8^{0}C and according to *The National Vaccine Storage Guidelines Strive for 5 (2013)*. Store out of patient and public access, preferably in a locked room or a locked cabinet securely attached to the wall or floor – see **PD2013_043**.
Adverse effects[1]	Pain, redness and swelling at the injection site are common. Headache, malaise, myalgia and fever are uncommon. Anaphylaxis, urticaria and peripheral neuropathy are rare. Brachial neuritis is very rare.
Nursing Accreditation Requirements	An RN whose competency to practice Nurse Delegated Emergency Care and to comply with this Standing Order has been assessed and approved by a *Local Facilitator*, in accordance with the NDEC Education and Accreditation Framework.
Documentation	*Record specific medication trade name and batch number in notes and in discharge letter (will allow GP to update Patient Healthcare Record)* Administration record is to be documented by the administering nurse. Document on the "once only" section of the appropriate medication chart The record of administration must be checked and countersigned by a medical officer within 24 hours of initial administration.

SAFE ASSESSMENT ROOMS (GL2020_001)

PURPOSE

The purpose of this Guideline is to outline the requirements for the design and use of Safe Assessment Rooms (SARs) in NSW Emergency Departments (EDs). A SAR is designed to accommodate the needs of patients with, or at risk of developing, acute severe behavioural disturbance (ASBD) who require assessment in a therapeutically supportive environment.

KEY PRINCIPLES

- All NSW Health Organisations with a SAR should have local processes in place which comply with this Guideline and support the principles detailed here.
- The SAR is a staffed clinical area for the purposes of ED staffing allocation, staff establishment and clinical governance
- ED capacity relies on the flexible use of treatment spaces, and no individual patient group is identified as being the sole user of the SAR. The room may be used for a variety of clinical purposes.
- SARs have a number of design features which allow the patient to be managed in a safe environment while also optimising the safety of other patients and staff.
- The use of co-design methodology is a key principle to inform and support development, design and use of the SAR.
- SARs are not intended to be used for seclusion
- SARs should not be the default pathway in the ED for people presenting with mental health conditions.
- A collaborative approach between the ED and mental health (MH), drug and alcohol, and security services on the governance, safe practice, and use of SARs is beneficial for good patient outcomes.
- Police and NSW Ambulance are key stakeholders.

USE OF GUIDELINE

This Guideline should be used as a resource to support NSW Health organisations to co-design clinical spaces and local guidelines and policies to support management of patients with or at risk of developing ASBD.

To download the complete guideline go to:
https://www1.health.nsw.gov.au/pds/Pages/doc.aspx?dn=GL2020_001

EARLY EVIDENCE COLLECTION (GL2022_010)

GUIDELINE SUMMARY

Early evidence collection is the process of supporting a patient who has or may have experienced a recent sexual assault to self-collect early forensic and/or toxicology samples to support the criminal justice process.

The Guideline provide clinicians with guidance for facilitating, storing, and documenting early evidence collection.

KEY PRINCIPLES

Early evidence collection is offered as part of an integrated crisis response when a person has or may have experienced a recent sexual assault.

Early evidence kits are to be offered to adults, young people and children who are able to self-collect samples.

Early collection of forensic and toxicology samples is to be offered in all sexual assault services and Level 3-6 Emergency Departments. This may also be offered in other NSW Health settings at the discretion of Local Health Districts (districts) and Specialty Health Networks (networks).

A person's physical and emotional health, safety and wellbeing must be prioritised even when particular time frames exist in the gathering of forensic evidence.

When offering early evidence collection, NSW Health workers must provide responses that:

- are respectful, non-judgmental and validating
- assist the person to regain their sense of dignity and control
- help access information and resources
- promote choice and control over actions taken • increase safety
- support the person in reconnecting with the self and to those who provide safe support.

All settings offering early evidence collection must consult with the district or network's sexual assault service to draft local processes that follow the principles and processes within this Guideline. Local processes must include a pathway for involving a sexual assault service in the collection, storage, release and destruction of forensic and toxicology samples to ensure psychosocial support for the patient is prioritised.

https://www1.health.nsw.gov.au/pds/Pages/doc.aspx?dn=GL2022_010

MANAGING NON-FATAL STRANGULATION IN THE EMERGENCY DEPARTMENT (IB2023_038)

PURPOSE

This Information Bulletin advises local health districts and specialty health networks of the publication of the Agency for Clinical Innovation Clinical Practice Guide **Managing non-fatal strangulation in the emergency department**.

The Clinical Practice Guide outlines the necessary assessment and clinical management of non-fatal strangulation, including medical imaging for patients presenting with non-fatal strangulation and mandatory reporting requirements along with addressing the psychosocial factors that need to be addressed as part of care in the emergency department.

KEY INFORMATION

The Clinical Practice Guide Managing non-fatal strangulation in the emergency department provides clinical support to those managing adult and paediatric patients presenting to the emergency department with non-fatal strangulation.

The Clinical Practice Guide has been developed to improve patient care by increasing healthcare workers' awareness of the potential risks and injuries resulting from non-fatal strangulation, and by outlining appropriate assessment and management or care coordination of an episode of non-fatal strangulation.

The Clinical Practice Guide emphasises the importance of follow up for people who have experienced non-fatal strangulation who are a population at high risk of poor outcomes.

The Clinical Practice Guide is supported by the **Non-fatal strangulation facility contact list** which is a document for facilities to populate with psychosocial support services, referral pathways, specialist advice and employee support details for staff.

CHAPTER 7 – EYE CARE

TABLE OF CONTENTS

	PD/IB/GL NUMBER

CHAPTER 8 – POLICY ON SMOKING IN THE WORKPLACE

TABLE OF CONTENTS

	PD/IB/GL NUMBER
NSW Health Smoke-Free Health Care Policy	PD2015_003
Amendment to the NSW Health Smoke-Free Health Care Policy PD2015_003	IB2018_026

NSW HEALTH SMOKE-FREE HEALTH CARE POLICY (PD2015_003)

PURPOSE

The aim of this Policy Directive is to reduce the risks to health associated with tobacco use by clients, staff and visitors to NSW Health facilities and the community's exposure to second-hand smoke. This policy applies to banning the use of cigarettes and other smoking products in NSW Health buildings, grounds and vehicles and also to the use of electronic cigarettes to eliminate the risks of exposure to particulate matter emitted by second-hand vapour. However, in the case of electronic cigarettes the smoke-free by-law and the *Smoke-free Environment Act 2000* do not apply.

MANDATORY REQUIREMENTS

Compliance with the NSW Health Smoke-free Health Care Policy means that all NSW Health buildings, grounds and vehicles are smoke-free with the exception of designated outdoor smoking areas determined by Local Health Districts (LHDs) and speciality network governed statutory health corporations that choose to provide such areas using a smoke-free by-law.

LHDs and speciality network governed statutory health corporations will ensure compliance with smoke-free by-laws where they are in place. Where appropriate and in line with the NSW Health Prosecution Policy and Guidelines, Penalty Infringement Notices (PINs) may be issued to staff, clients and visitors who fail to comply with the smoke-free by-law. LHDs will also enforce the *Smoke-free Environment Act 2000 (*the Act) in settings applicable to buildings and grounds regardless of whether a smoke-free by-law exists.

This includes:

- Enclosed public places.
- Within 4 metres of the pedestrian access point to buildings.
- Bus stops and cab ranks, where people queue or gather.
- Within 10 metres of children's play equipment.
- In commercial outdoor dining areas from 6 July 2015.

Staff, clients and visitors to NSW Health facilities will be informed about smoke-free requirements under this policy, the Act and smoke-free by-laws, where they exist.

All clients of LHDs, St Vincent's Health Network and speciality network governed statutory health corporations will be asked about their smoking status and those who smoke will be supported to manage their nicotine dependence and quit, through:

- Provision of brief intervention to clients including the option of nicotine replacement therapy (NRT), where clinically appropriate.
- Provision at discharge of at least three days' supply of any NRT product the client has been using in hospital.
- Referral to Quitline 13 78 48 and/or a smoking cessation advisor for ongoing advice and support to quit.

All staff of LHDs, St Vincent's Health Network and speciality network governed statutory health corporations who smoke will be able to access from their organisation, at least four weeks' supply of free NRT per year (including a variety of NRT product choices).

IMPLEMENTATION

NSW Ministry of Health responsibilities

- Develop model smoke-free by-laws and Instrument of Appointment for use by LHDs and speciality network governed statutory health corporations.
- Develop and distribute a state-wide guide on smoking cessation and brief intervention.

Chief Executive responsibilities

- Ensure the requirements and standards of the Policy are implemented, monitored, reviewed and acted on accordingly.
- Determine whether to implement a smoke-free by-law to allow smoking bans in NSW Health buildings, vehicles and grounds not already covered by the Act to be enforced, designated smoking areas to be established and PINs to be issued (relevant for LHDs and speciality network governed statutory health corporations only).
- Enforce the Act as it applies to NSW Health buildings and grounds and the smoke-free by-law, where this is in place.
- Support managers and staff to implement the policy, including following up on reported breaches.
- Report implementation progress of the policy to the Ministry on a regular basis.
- Ensure a system is in place to support staff to quit or manage their nicotine dependence including access to brief intervention, at least four weeks of free NRT per year, where clinically appropriate and referral to NSW Quitline 13 78 48 and/or smoking cessation advisor (relevant to LHDs, St Vincent's Health Network and speciality network governed health corporations only).

Manager responsibilities

- Support staff to implement and comply with the policy and monitor staff compliance.
- Implement an appropriate strategy to inform clients, staff and visitors of the policy.
- Support all relevant staff to obtain smoking cessation training and ensure clinical staff provide brief intervention to all clients who smoke, where applicable.
- Ensure cessation support is available to staff to quit or manage their nicotine dependence, including provision of at least four weeks free NRT per year where clinically appropriate and referral to NSW Quitline 13 78 48 and/or smoking cessation advisor (relevant to LHDs, St Vincent's Health Network and speciality network governed health corporations only).

Staff responsibilities

- Implement and comply with the policy.
- Access smoking cessation training and provide routine brief intervention to clients who smoke, including assessment and documentation of clients' smoking status and support to manage nicotine dependence including provision of NRT, where clinically appropriate, referral to NSW Quitline 13 78 48 and/or smoking cessation advisor (relevant to LHDs, St Vincent's Health Network and speciality network governed health corporations only).

NOTIFICATION OF AMENDMENT TO THE NSW HEALTH SMOKE-FREE HEALTH CARE POLICY PD2015_003 (IB2018_026)

PURPOSE

The Information Bulletin is to notify the NSW Health system that the *Smoke-free Environment Amendment Act 2018* will commence on 1 July 2018. This means that in the case of electronic cigarettes that the *Smoke-free Environment Act 2000* will apply and will also cover Local Health District smoke-free by-laws that refer to the *Smoke-free Environment Act 2000*.

KEY INFORMATION

The NSW Health Smoke-free Health Care Policy bans the use of cigarettes and other smoking products in NSW Health buildings, grounds and vehicles and also the use of electronic cigarettes to eliminate the risks of exposure to particulate matter emitted by second-hand vapour.

The Smoke-free Environment Amendment Act 2018 will commence on 1 July 2018. The Act amends the Smoke-free Environment Act 2000 to prohibit the use of e-cigarettes in public places where the Smoke-free Environment Act 2000 currently bans smoking. This Act will also affect the smoke-free by-laws. Local health districts smoke-free bylaws that refer to the Smoke-free Environment Act 2000 will automatically cover ecigarette use in the same way they cover smoking cigarettes. This means Penalty Infringement Notices (PINs) may be issued for using e-cigarettes where a PIN could be issued for smoking

MENTAL HEALTH CLINICAL DOCUMENTATION (PD2021_039)

PD2021_039 rescinds PD2010_018

POLICY STATEMENT

NSW Health organisations must ensure that all mental health services use available electronic medical record (eMR) systems for the documentation of clinical practice and care. This is required in all service settings, for all service types and age groups, and enables integrated health services and clinical information systems across NSW.

Digital documentation facilitates the recording, retrieval and sharing of medical record information in an accessible, standardised and structured format. This is important at all points in the cycle of mental health care from triage through to transfer or discharge.

All NSW Public Health Organisations must ensure that local processes are in place which comply with this Policy.

SUMMARY OF POLICY REQUIREMENTS

Electronic health systems are to be supported by Local Health Districts (Districts) and Specialty Health Networks (SHNs) by implementing products and functionalities as they become available. Local systems, processes and procedures are to be maintained, including those required for downtime when needed. There must also be training and education provided for clinicians in the areas of mental health clinical documentation, and related eMR systems and processes.

eMR systems must include available electronic mental health (MH) documents, including notes, forms, measures and reports.

Clinical care and information must be documented and are to be recorded within the eMR, with paper records used only where there is no current alternative.

Documentation must occur at appropriate clinical points of care, including triage, assessment, care planning, review, transfer and discharge. It must be made as soon as practically possible in the eMR clinical document(s) relevant to the clinical point of care and needs of the person accessing the service.

Structured documentation is to be used to aid functionalities that auto-populate fields, and transfer information between documents and systems. This is critical to clinical care and support across services and systems within NSW Health. Only relevant fields need to be completed. There are no requirements that all fields or areas of a document are to be completed.

9. HEALTH RECORDS AND INFORMATION 9.2

All persons registered to a mental health service must have the following recorded in their documentation: Designated Carer(s) and/or Principal Care Provider information; Diagnosis (issues that are the focus of the current admission or encounter); Legal Status; and Alerts (for care and safety of the person, carer(s) and health workers).

There must be clinical reasons to use non mental health or alternative documentation or free text. In these circumstances, the clinician must be aware that auto-population and transfer functions will not be enabled. The clinician is to ensure that documentation reflects the content of the standardised eMR document, and the format of documentation is legible and locatable by other clinicians involved in care.

PRIVACY MANAGEMENT PLAN (IB2023_012)

IB2023_012 replaced PD2015_036

PURPOSE

The NSW Health Privacy Management Plan has been published on the NSW Health website Patient privacy.

All NSW Health organisations are required to adopt and implement the NSW Health Privacy Management Plan within their organisation and promote it to their staff and the public, including through publication of the Plan on their public facing websites.

KEY INFORMATION

Key actions for NSW Health organisations

All NSW Health organisations must ensure the collection, use, management and disclosure of personal and health information complies with the Information Protection Principles and with the Health Privacy Principles, as detailed in the *Privacy and Personal Information Protection Act 1998* (NSW) and *Health Records and Information Privacy Act 2002* (NSW), respectively.

NSW Health organisations are required to have a Privacy Contact Officer (or a designated staff member), whose role includes to facilitate compliance with privacy laws and NSW Health privacy policy in their organisation.

New staff members in NSW Health organisations are to complete mandatory privacy training as part of their induction and orientation process.

Where staff have access to large data sets of personal and health information in their roles, NSW Health organisations must ensure that, in addition to privacy training, appropriate privacy undertakings have been signed, prior to these systems being accessed.

Appropriate collection notices are to be used to satisfy privacy requirements when personal and health information is being collected, particularly when new programs or systems are being developed.
A request for a privacy internal review must be completed as soon as practicable, and within 60 calendar days.

Any wilful act of unauthorised access to, use, or disclosure of, personal or health information by a staff member is to be referred to human resources for advice regarding appropriate disciplinary action. In consultation with the NSW Ministry of Health, the chief executive must give consideration for referring the matter to the police, and/or informing persons affected by a breach, of the option of referral to prosecution.

NSW Health organisations have privacy-related statutory reporting obligations, including obligations under the *Independent Commission Against Corruption Act 1988* (NSW), the *Privacy Act 1988* (Commonwealth), the *My Health Records Act 2012* (Commonwealth), and the *Security of Critical Infrastructure Act 2018* (Commonwealth). Mandatory reporting obligations include privacy breaches involving inappropriate use/ disclosure of Tax File Numbers, My Health Record data breaches, other privacy matters related to corrupt conduct, and for notifying cyber security incidents to the Australian Cyber Security Centre.

Each NSW Health organisation is to provide a submission to the NSW Ministry of Health by 31 July each year, that outlines the actions it has undertaken in relation to privacy management and compliance, and details of privacy statistics, for the financial year immediately prior.

All NSW Health organisations are to publish their own privacy management actions and statistics (as included in the submission to the NSW Ministry of Health) on their own websites after the NSW Health Annual Report has been published on the NSW Health website, and by no later than 30 November of that same year.

Further information on privacy-related matters is available in the *NSW Health Privacy Manual for Health Information*.

About the NSW Health Privacy Management Plan

The NSW Health Privacy Management Plan:

- Demonstrates to members of the public and other third parties how NSW Health meets its obligations under the *Privacy and Personal Information Protection Act 1998* (NSW)
- Provides an overview of how personal information is managed appropriately and in accordance with the law, and provides advice about the management of staff members' personal information
- Demonstrates NSW Health's commitment to respecting the privacy rights of staff, members of the public, and other third parties together with a Privacy Information Sheet for Personal Information
- Sets out how individuals, whether they are staff or members of the public, can access their personal information, seek to amend their personal information, submit a privacy complaint, and request a privacy internal review and how possible breaches of privacy in relation to personal information will be managed by NSW Health
- Outlines limits on access to personal information and legislative exemptions (including Public Registers, Public Interest Directions and Codes of Practice)
- Sets out the remedies available to individuals, if they have a concern that the privacy of their personal information has been breached.

PHOTO AND VIDEO IMAGING IN CASES OF SUSPECTED CHILD SEXUAL ABUSE, PHYSICAL ABUSE AND NEGLECT (PD2015_047)

PURPOSE

The purpose of this Policy Directive is to:

- Define the NSW Health requirements and minimum standards for the use and management of photo and video imaging in cases of suspected child sexual abuse, physical abuse and neglect
- Guide NSW Health staff when capturing, storing and managing images for the purpose of documenting health and clinical features and informing possible future judicial proceedings that require medical opinion.

MANDATORY REQUIREMENTS

This policy requires that:

- The immediate and longer-term physical and emotional needs of the child and their parent(s) / guardian(s) are identified and taken into account when considering photo and video imaging.
- Imaging is captured for the primary purpose of documenting a clinical finding for the health care record and limited other relevant purposes, and is not excessive or unreasonably intrusive.
- Imaging is only captured where informed consent is sought and obtained for each purpose for which it may be used.
- Capture, recording and storage of images is limited to LHD / SCHN owned memory devices.
- Images are stored securely and are stored separately from the principal health care record, to maintain patient privacy.
- Limited access is provided to images, to maintain patient privacy.
- Capture, use and management of photo and video images in cases of suspected child abuse is conducted in accordance this Policy Directive, in conjunction with:
  Child Wellbeing and Child protection Policies and Procedures for NSW Health (PD_2013_007)
  Current Standards and Practice Guidelines for NSW Health Sexual Assault Services
  Child Wellbeing and Child Protection – NSW Interagency Guidelines,

- Consent, privacy, confidentiality, management and retention is preserved in accordance with the NSW Health Consent to Medical Treatment - Patient Information policy, 2005, NSW Health Privacy Manual for Health Information, 2015, NSW Health Care Records – Documentation and Management Policy (PD2012_069), NSW Health Electronic Information Security Policy (PD2013_033), NSW Government Digital Information Security Policy M2012-15, NSW Health Subpoena policy (PD2010_065) and NSW Government General Retention and Disposal Authority policy (GDA17; 2011).

IMPLEMENTATION

Chief Executives are responsible and accountable for:

- Establishing mechanisms to ensure the directives and requirements of this policy are applied, achieved and sustained
- Ensuring that NSW Health staff understand and are aware of their obligations in relation to this policy and related policies and procedures
- Ensuring resources are available to deliver and meet the directives and requirements of this policy
- Ensuring that NSW Health staff are trained to operationalise and implement this Policy
- Ensuring NSW Health staff are advised that compliance with this policy is part of their patient / client care responsibilities
- Ensuring that procedures for capture, storage, access and security are subject to risk analysis reassessment over time.

Facility managers are responsible for:

- Ensuring the requirements of this policy directive are disseminated and implemented in their service / department / hospital
- Establishing local validated processes for image preparation, capture, processing, storage, transmission, archiving, retention and disposal
- Monitoring implementation and compliance with this policy.

NSW Health workers are responsible for:

- Implementing and complying with the directives and requirements of this policy
- Ensuring that their knowledge of consent, privacy and documentation management processes is maintained, consistent with the requirements of this policy directive.

1 INTRODUCTION

1.1 Rationale

Clinical evaluation of a child or young person who is suspected of having been abused or neglected involves a holistic assessment of their physical needs, psychosocial needs, medical history, and any social or familial risk factors. NSW Health practitioners are required to document and report suspicion of harm and may use clinical photo and video imaging to supplement and enhance the detail in written notes and diagrams. Imaging can assist the physician to review the facts associated with clinical examination and history as part of their clinical diagnosis: in an attempt to ensure the accuracy of a diagnosis this may include professional peer review. Diagnoses in cases of suspected child abuse have an impact on the safety, welfare and wellbeing of a child or young person. Clinical photo and video imaging is an important tool in the achievement of accurate clinical conclusions to support the needs of children and young people.

This policy defines the NSW Health requirements and minimum standards for the use and management of photo and video imaging in cases of suspected child sexual abuse, physical abuse and neglect. It will guide NSW Health workers to know what actions to take when capturing, storing and managing images for the purpose of documenting health and clinical features, and informing possible future judicial proceedings that require medical opinion. A development group was convened to inform the development of this policy. Details of membership appear at Appendix 5.5.

1.2 Who this policy applies to

This policy applies to NSW Health workers in Local Health Districts (LHDs) and the Sydney Children's Hospitals Network (SCHN) who are employed or contracted to capture or manage imaging in cases of suspected child abuse, including:

- Medical practitioners or other specialist staff undertaking medical and forensic examinations of children and young people aged under 18 who are suspected of having been sexually abused, physically abused or neglected
- Psychosocial, sexual assault and child protection practitioners, coordinators and managers
- Medical photographers, Joint Investigation Response Teams (JIRTs), Aboriginal health services and other clinical and allied health staff
- Managers or officers who support the capture, viewing, accessibility, transmission or management of photo and video imaging. This includes data custodians, IT technical and support staff, health information managers and staff in medical records departments.

The policy may also be of interest to:

- NSW Health interagency child protection partners
- Those who work in the wider criminal justice setting and child health and advocacy settings
- Networks that support children and young people who have experienced sexual abuse, physical abuse or neglect and their non-offending family members
- Those who work in private health settings who wish to adopt minimum standards for the use and management of photo and video imaging in cases of suspected child abuse.

1.2.1 Exclusions

This policy does not apply to:

- Sexual abuse examinations utilising clinical colposcopic equipment without capture of imaging
- Photo and video imaging taken in other types of medical examinations (i.e. those that do not relate to suspected child abuse)
- Medical imaging such as Magnetic Resonance Images (MRIs), Computerised Tomography (CT) scans, skeletal surveys, radioisotope scans or post-mortem imaging.

1.3 Service users

Children or young people who use NSW Health services in relation to suspected sexual abuse, physical abuse and/or neglect and, depending on the age of a young person, this may include parent(s), carer/(s) or guardian(s).

1.4 Context for practice

1.4.1 Interagency context

Medical and forensic examinations and associated photo and video imaging take place in the context of an interagency response to child protection. Interagency roles and responsibilities are outlined in the Child Wellbeing and Child Protection Policies and Procedures for NSW Health, 2013, current standards and guidelines for NSW Health Sexual Assault Services and NSW Interagency Guidelines.

1.4.2 NSW Health context

The psychosocial and medical needs of a child or young person are a priority and need to be responded to appropriately. NSW Health's role is to provide an integrated psychosocial and medical response to all suspected child abuse presentations including assessment, crisis intervention and counselling. The medical response will potentially include a medical and forensic examination.

Medical and forensic examinations are critical to the crisis response required on presentation of: a child victim of sexual abuse to a Sexual Assault Service or Emergency Department; or a child with suspected physical abuse or neglect to a medical practitioner, Emergency Department, or other health service.

Related child protection and violence prevention, privacy, security and document management policies are listed in Appendices 5.1 to 5.4.

1.4.3 Clinical context

Clinical photography has assisted in the development of medical knowledge and skills within the NSW Health workforce over the last two decades, and aided the interpretation and evaluation of injuries, for the benefit of examiners and their patients. Medical and forensic assessment of children suspected of having been abused occurs within a framework that responds to the immediate psychosocial and medical needs of a child and their family – who are often traumatised and distressed.

This context includes:

- Identification of children at risk who require a medical and forensic assessment
- Recording of medical history and examination findings complemented by appropriate clinical photo or video imaging
- Forensic specimen collection where relevant (as in recent sexual abuse)
- Medical treatment of injuries or other sequelae of the abuse, such as the risk of exposure to sexually transmitted diseases or pregnancy
- Interpretation of clinical findings, with a reference to any allegation of abuse.

Anatomical diagrams are useful for recording certain features of an injury, such as the number of injuries, the type of injuries, their overall size and shape and the general location of the injuries on the body. It is difficult for a doctor to record adequately sufficient information for detailed medical and forensic assessment of many injuries with diagrams and words alone. Medical illustration is a specialised career. It takes both skill and time to produce an accurate and useful medical drawing. The extra detail provided by a photo or video record is of particular relevance when a medical and forensic examiner is asked to comment, sometime after the medical examination, on whether a particular account of accidental injury, provided by a caregiver, might reasonably account for the clinical findings.

Several advantages of photography can be summarised as below:

- Photo and video images allow review of injuries or other clinical findings, such as evidence of dermatological conditions or malnutrition, in a more comprehensive manner. Indeed there are many reasons why a child's injuries may need to be reviewed. The original examining doctor may review photos when preparing an expert certificate and/or prior to appearing in court. Photo and video imaging can assist the examining doctor when they review the patient for ongoing clinical care, or if the police provide additional information and ask for a clinical opinion, in regards injury causation. Photo and video imaging is useful for gaining a second opinion by a senior colleague as to the significance of the injury and also helps determine if specialist referral is necessary. It may also prevent the need for a child to travel long distances to a specialist centre
- Imaging can overcome the difficulties presented by children and young people having to lie still for extended periods of time. Children can naturally wriggle and not want to lie still – especially if they have experienced sexual abuse or if there is injury or recent assault. This is particularly relevant to examining the ano-genital regions, especially in pre-pubertal females where there is a need to assess in detail the significance of small anatomical structures which may be a normal variant or an indicator of recent or earlier injury

- Sexual abuse assessment in pre-pubertal children is complex. Paediatric genital anatomy is variable and accurate observation and interpretation is difficult. Forensic colposcopic imaging allows the examination to proceed with the knowledge that a child or young person can benefit from subsequent specialist review of the imaging as a record of the complex clinical findings
- Photo and video imaging may enable the medical examiner to capture a clear picture of an area that was only exposed for a few seconds. The use of photo and video imaging can in many cases prevent the need for a child or young person to return for a repeat examination, or undergo examination under anaesthesia.

It is best practice in Forensic Medicine to rigorously separate the observation and recording of findings from the interpretation of those findings. Photo and video imaging enables the examiner to concentrate on observation, which is demanding, and then to later consider all possible causes.

1.4.4 Intimate images, sensitive evidence and retention

Photo and video imaging captured as part of a medical and/or forensic assessment may include intimate images.

Intimate images are defined as depicting the genitalia, anus or post-pubertal female breast (Faculty of Forensic & Legal Medicine, 2014) and may also include other parts of the body, such as the buttocks or chest of a pre-pubertal child.

These images are considered as 'sensitive evidence' under the *Criminal Procedure Act 1986* (Section 281B). Where they are held by the NSW Police Force and Office of the Director of Public Prosecutions (ODPP) access to them is restricted. These restrictions do not extend to images held by NSW Health. Where a subpoena has been validly lodged, the court is not obliged to restrict access to intimate images held by NSW Health.

In accordance with health care record retention policies, once an image is captured as a medical record it can be subpoenaed, shown in court and remains on a medical record file for at least 30 years (NSW Government General Retention and Disposal Authority policy, 2004, revised 2011).

2 NSW HEALTH MINIMUM STANDARDS

When use of photo and video imaging is being considered during medical and forensic examinations in cases of suspected child sexual abuse, physical abuse and neglect, NSW Health will ensure that:

1. The immediate and longer-term physical and emotional needs of the child and their parent(s)/guardian(s) are identified and taken into account. (Section 2.1)
2. Imaging is captured for the primary purpose of documenting a clinical finding for the health care record and other directly related purposes, and is not excessive or unreasonably intrusive. (Section 2.2)
3. Imaging is only captured where informed consent is sought and obtained for the specific purposes for which it may be used. (Section 2.3)
4. There are standardised procedures for capturing and documenting images to reduce variation across statewide services. (Section 2.4)
5. Capture, recording and storage of images is limited to LHD/SCHN owned memory devices. (Section 2.5)
6. Images are stored securely and separately from the principal health care record, to maintain patient privacy. (Section 2.6)
7. Restricted access is provided to images, to maintain patient privacy. (Section 2.7)
8. The integrity of images is maintained in the longer-term. (Section 2.8)

2.1 Physical and emotional needs of the child or young person

Standard: The immediate and longer-term physical and emotional needs of the child and their parent(s)/guardian(s) are identified and taken into account when considering photo and video imaging

In accordance with the Child Wellbeing and Child Protection Policies and Procedures for NSW Health, 2013 and current standards and guidelines for NSW Health Sexual Assault Services:

- In cases of suspected physical abuse and neglect, optimally, assessment should be conducted by the medical officer with a social worker or other health professional colleague, e.g. a nurse, present to facilitate a holistic assessment (Suspected Child Abuse and Neglect (SCAN) Medical Protocol, 2014).
- In cases of suspected sexual assault a joint response by the medical practitioner and counsellor from the Sexual Assault Service or Child Protection Unit provides the professional response required in these circumstances (Child Wellbeing and Child Protection Policies and Procedures for NSW Health, 2013).

When deciding whether and how to capture images in this context, NSW Health workers must:

- Identify and take into account:
  - Factors arising from the life circumstances of the child or young person, their psychosocial development, vulnerability to particular risks and their linguistic, cultural and religious needs
  - The circumstances in which the child or young person was alleged to have been assaulted, abused or neglected
    - The need for an appreciation and understanding of Aboriginal people and communities' inter-generational trauma legacies, the impact of power dynamics, the importance for understanding an Indigenous world-view, including cultural practices and protocols, the multiple and inter-related factors that contribute to the poorer health status of Aboriginal people, and the limitations of Western approaches in the assessment and treatment of trauma (see http://www.health.nsw.gov.au/aboriginal/pages/default.aspx).
- Ensure that children, young people and their parent(s)/guardian(s) have:
  - Access to health information relative to their wellbeing
  - The opportunity to participate in decision making
  - Access to an interpreter if required (see Interpreters – Standard procedures for working with Health Care Interpreters)
  - Access to an Aboriginal Health worker if desired. It is important to determine at the beginning the most appropriate person or people to communicate with in relation to the patient.

2.2 Purpose of imaging

Standard: Imaging is captured for the primary purpose of documenting a clinical finding for the health care record and other directly related purposes, and is not excessive or unreasonably intrusive

In accordance with the NSW Heath Privacy Manual for Health Information, 2015:

- The primary purpose for collecting photo and video imaging is to document a clinical finding for the medical record
- Imaging must be relevant to the purpose, not excessive, accurate, up to date, complete and must not be unreasonably intrusive
- Collection of photo and video imaging must supplement, not replace, other methods of documenting findings

- Other directly related purposes for collecting photo and video imaging may include:
  - Peer review to assist diagnosis
  - Providing an aide-memoire for potential future legal proceedings
  - Teaching, research and quality improvement activities (sections 2.3.3, 2.7.1, 2.8 and 2.9).

LHDs/SCHN must ensure that images are only captured and used for relevant purposes in accordance with the NSW Heath Privacy Manual for Health Information, 2015.

2.3 Seeking consent

Standard: Imaging is only captured where informed consent is sought and obtained for the specific purposes for which it may be used

LHDs/SCHN must ensure that NSW Health workers act in accordance with the NSW Health Consent to Medical Treatment - Patient Information policy, 2005 and the NSW Health Privacy Manual for Health Information, 2015 and comply with 2.3.1 to 2.3.3 below. Additional advice may be sought from NSW Health Legal and Regulatory Services.

2.3.1 Who should seek consent

An examiner must ensure that valid consent has been obtained. An examiner may ask another health care practitioner to seek consent, however the examiner maintains responsibility and may be held responsible in some circumstances if consent is not sought correctly (NSW Health Privacy Manual for Health Information, 2015).

2.3.2 Who can provide consent

Where a child or young person is less than 14 years of age, consent given by a parent or legal guardian is generally necessary. In some circumstances, consent can be given by the young person if he or she is considered by the treating health care practitioner to be mature enough, and if this would be appropriate in the circumstances. See '*Gillick* competence' in the 'Glossary'.

Where a young person is aged 14 or 15 they are generally able to consent, however an assessment of their maturity and understanding will still need to be made. Effort should be made to seek the consent of a parent or legal guardian unless the young person indicates a strong objection, and this is reasonable in the circumstances. Alternatively a parent or legal guardian can provide consent, however it would be exceptional to proceed on the basis of parent or guardian consent without the acquiescence of the young person aged 14 or 15.

Where the young person is 16 years of age or over they should generally be capable of consenting themselves (NSW Health Consent to Medical Treatment - Patient Information policy, 2005; NSW Heath Privacy Manual for Health Information, 2015).

For guidance on capacity to consent see the NSW Health Consent to Medical Treatment - Patient Information policy, 2005 and the NSW Heath Privacy Manual for Health Information, 2015.

Occasionally, a parent delegates their responsibility for consenting to medical treatment on behalf of their minor child, to another adult. This may occur in certain cultures, for example, in relation to Aboriginal children, where an extended family member, rather than the child's mother or father, might be responsible for giving consent on their behalf. Where NSW Health workers require advice about who is able to provide consent for imaging they should consider the following options:

- Refer to policy relating to:
  - The broader context of consent for the examination (NSW Health Consent to Medical Treatment - Patient Information policy, 2005; NSW Heath Privacy Manual for Health Information, 2015)
  - Child Wellbeing and Child protection Policies and Procedures for NSW Health, 2013 and current standards and guidelines for NSW Health Sexual Assault Services
- Contact NSW Health Legal and Regulatory Branch or NSW Kids and Families during business hours
- Contact the Guardianship Division of the NSW Civil and Administrative Tribunal.

2.3.3 The consent process

Where child sexual abuse, physical abuse or neglect is suspected and the capture and use of photo and video imaging is considered as part of a medical and forensic examination, informed consent must:

- Be sought in accordance with the NSW Health Consent to Medical Treatment - Patient Information policy, 2005 and the NSW Health Privacy Manual for Health Information, 2015 and
- Address consent for the capture of the image(s) and the separate specific purposes for which image(s) may be used.

The consent process must include:

- Patient/parent/guardian access to culturally appropriate information
- Seeking written informed consent for the capture of photos to document a clinical finding
- An explanation to the child or young person and/or their parent(s)/guardian(s)
  - What the procedure for capturing imaging will involve
  - That imaging may include ano-genital and breast/chest areas of the body and that they may opt to exclude imaging of these or other specific body areas
  - That any records of examinations, findings, photos, videos, samples/specimens taken in accordance with the consent/s given
    - Will be stored in accordance with NSW Health: Health Care Records – Documentation and Management policy, 2012 and the NSW Government General Retention and Disposal Authority policy, 2004 (revised 2011) for a minimum of 30 years
    - May be referred to another clinician for a second opinion and peer review
    - May be forwarded to the NSW Police Force, ODPP, and by the court under subpoena, including the judge, the jury, the defendant, counsel for both prosecution and defence and any other people whom the judge considers relevant
    - May be produced to comply with a request to a NSW Health organisation under the legislation set out in the *Children and Young Persons (Care and Protection) Act* 1998
    - May be forwarded to parties in Family Court proceedings under subpoena

For the purpose of this policy the consent process must also include:

- Seeking separate informed consent for the use of copies of photo and video imaging for a) teaching and/or b) approved research. All such copies must be de-identified, the teaching and research activities must be compliant with the NSW Health Privacy Manual for Health Information, 2015 and other relevant NSW Health policies and research must be approved by a Research Ethics Committee (for example, see https://hrep.nhmrc.gov.au/certification/hrecs, http://www.ahmrc.org.au/ethics2.php and www.ipc.nsw.gov.au/statutory-guidelines-research-purposes-pdf).

Human Research Ethics Committees – Quality Improvement & Ethical Review: A Practice Guide for NSW can help to determine whether an activity constitutes a research or quality improvement activity.

- An explanation that consent for the future use of images for a) teaching and/or b) approved research activities may be withdrawn by the person who provided consent or the person depicted in the image(s) once they are Gillick competent.

An interim NSW Health consent form is located in Appendix 5.6.

2.4 Procedures for capturing and documenting imaging

Standard: There are standardised procedures for capturing and documenting images to reduce variation across statewide services

LHDs/SCHN must support NSW Health workers to comply with 2.4.1 and 2.4.2 below.

2.4.1 Capturing imaging

Capture of imaging in cases of suspected child abuse must be conducted in accordance with the NSW Health Privacy Manual for Health Information, 2015, and must be restricted to NSW Health workers with suitable training and experience in the procedures required to comply with this photo and video imaging policy.

At a minimum, NSW Health workers must:

- Carefully explain to the child or young person, and where appropriate their parent(s)/guardian(s), what the procedure is going to involve in advance of the examination
- Provide the opportunity for the child or young person, and/or parent(s)/guardian(s) to ask questions and receive answers in a way that takes into consideration the person's level of development and understanding as described in section 2.1 of this policy
- Seek informed consent as described in section 2.3 of this policy directive via a process that:
  - Explains what consent means in relation to the separate specific purposes for which images may be used (as described in section 2.3 of this policy directive) and the implications that may arise for the child, young person or their parent/guardian providing consent
  - Provides options for providing or refusing consent at any time during the course of the examination for:
    - The capture of images of specific areas of the body
    - The specific purposes for which images may be used.
- Consider whether the child or young person and their parent(s)/guardian(s) would find it helpful if the practitioner or other NSW Health worker demonstrated the use of the video colposcope and observation monitor. This could be achieved by displaying real time magnified images of objects and/or non ano-genital body parts on a monitor placed in a location easily seen by the child or young person and examiner
- Ensure that images of a child or young person's face are not captured, unless it is required to document a clinical finding
- Capture the minimum number of images required to adequately document a clinical finding
- Adopt the following good practice techniques:
  - Use a RAW (digital negative that requires processing), TIFF or JPEG format for capturing still images
  - Use a procedure that will allow reliable identification of the recording(s) in relation to the particular child or young person and the time that the image(s) was taken. For example, include the child's hospital ID label for identification purposes

- Include some form of further visual identification on the first and last image, including the child's name or initials, Medical Record Number (MRN) and/or Area Unique Identifier (AUID) and the date
- Include a scale in the image, where possible
- Consider anterior, posterior and lateral images of the patient and document the anatomical location of each image (an example 'Request for medical photography services' form is located in Appendix 5.7).

When conducting telehealth NSW Health workers must:

- Consider the professional capacity of the host and remote site examiners as either the supervising or the supervised clinician based on their relevant and appropriate training and experience
- Act in accordance with the requirements of this policy directive
- Consider using the good practice techniques set out in the Agency for Clinical Innovation Guidelines for the use of telehealth for clinical and non-clinical settings in NSW, 2015.

NSW Health does not support recording of an entire telehealth consultation with a patient or any audio recording.

2.4.2 Documenting imaging

NSW Health workers must:

- Act in accordance with NSW Health: Health Care Records – Documentation and Management policy, 2012 and the NSW Health Privacy Manual for Health Information, 2015
- Reference images using an individual health care patient identification system including a child or young person's name or initials, Medical Record Number (MRN) and/or Area Unique Identifier (AUID), date of birth (DOB), the date the images were captured and the name of the treating physician
- Document consent and the existence of images in the patient's medical records. For physical abuse and neglect the Suspected Child Abuse and Neglect (SCAN) Medical Protocol, 2014 may be used, unless this is being assessed in conjunction with suspected sexual abuse when the Child Sexual Assault Medical Protocol in the Sexual Assault Investigation Kit (SAIK) may be used. Details must include:
  - Any refusal of consent for capturing photo and video imaging
  - Any withdrawal of consent for the capture or use of photo and video imaging before and during the examination
  - The name of the photographer, the date and time, and the location of where the images were taken to maintain integrity in the event of legal action or issuing of a subpoena
  - The number and type of images that were taken
- Note that child abuse and neglect images must be stored securely and separately from a child or young person's principal health care record (see section 2.6.2) and a reference placed on the health care record where the images are located to identify the existence of any principal health care record or other relevant health related documents. Index or patient administration systems must reference the existence of satellite/decentralised health care records that address a specific issue and that are kept separate from the principal health care record
- Document authorised permission for release/transmission in the patient's medical records (see section 2.6.3 of this policy directive).

Where telehealth is used, document at both sites that the consultation has occurred and ensure that this documentation concurs.

It is good practice to disclose the existence of images to NSW Police Force on the Expert Certificate.

2.5 Devices used to capture, record, store and transmit images

Standard: Capture, recording and storage of images is limited to LHD/SCHN owned memory devices

LHDs/SCHN must ensure that:

- In cases of suspected child abuse, medical and forensic imaging is captured on dedicated LHD/SCHN owned:
  - Clinical camera imaging devices used for the sole purpose of documenting suspected sexual abuse, physical abuse, and neglect;
    - or where the sole purpose of a clinical camera is not restricted to documenting abuse or neglect, such as in an Emergency Department, the clinical camera must accommodate an LHD/SCHN owned removable memory device and images must be captured onto the removable device and not the camera, using one removable device per patient
  - Clinical colposcope imaging equipment, preferably used for the sole purpose of documenting sexual abuse
  - Portable or removable memory devices, such as DVDs, memory sticks and external hard drives
- Single Lens Reflex (SLR) clinical camera equipment is the preferred option and:
  - Includes a flash
  - Includes a lens with a close up facility
  - Has at least six megapixels.

  A 'stand-alone' personal camera (i.e. one that is not part of a mobile telephone or ipad) may be used in exceptional circumstances and only where:
  - No LHD/SCHN owned equipment is available and
  - The personal camera can accommodate an LHD/SCHN owned removable memory device and use is restricted to capturing images onto the removable device and not the personal camera, using one removable device per patient.
- All equipment complies with NSW Health Electronic Information Security Policy, 2013 and NSW Health Privacy Manual for Health Information, 2015
- Imaging equipment is:
  - Capable of producing an accurate representation of any evidential clinical finding being recorded
  - Appropriately maintained and managed, such as updating date and time settings recharging/replacing batteries
  - Strictly governed and controlled and adequately secured using lockable facilities
  - Monitored in respect of who accesses and uses it.
- Any equipment or devices used for remote access to NSW Health networks from an external location must be authenticated and authorised by the LHD/SCHN and connectivity must be protected by approved controls. This includes mobile devices, smartphones, tablets, netbooks, notebooks, palmtops, handheld personal organisers, laptops, modems, PDAs, wireless access points, portable or removable storage devices, CD/DVD burners and printers
- All imaging is protected and managed according to NSW Health Electronic Information Security Policy, 2013, NSW Government Digital Information Security Policy, 2015, and NSW Health: Health Care Records – Documentation and Management policy, 2012.

NSW Health does not support:

- The use of any other personal equipment or devices for the purpose of capturing or storing images in relation to suspected child abuse. Examples include cell phones, smartphones, tablet devices, netbooks, notebooks, palmtop, handheld personal organisers, laptops, USB drives, DVDs and removable memory cards and sticks
- Use of Skype or other insecure software/platforms in NSW Health care settings.

2.6 Security and storage of images

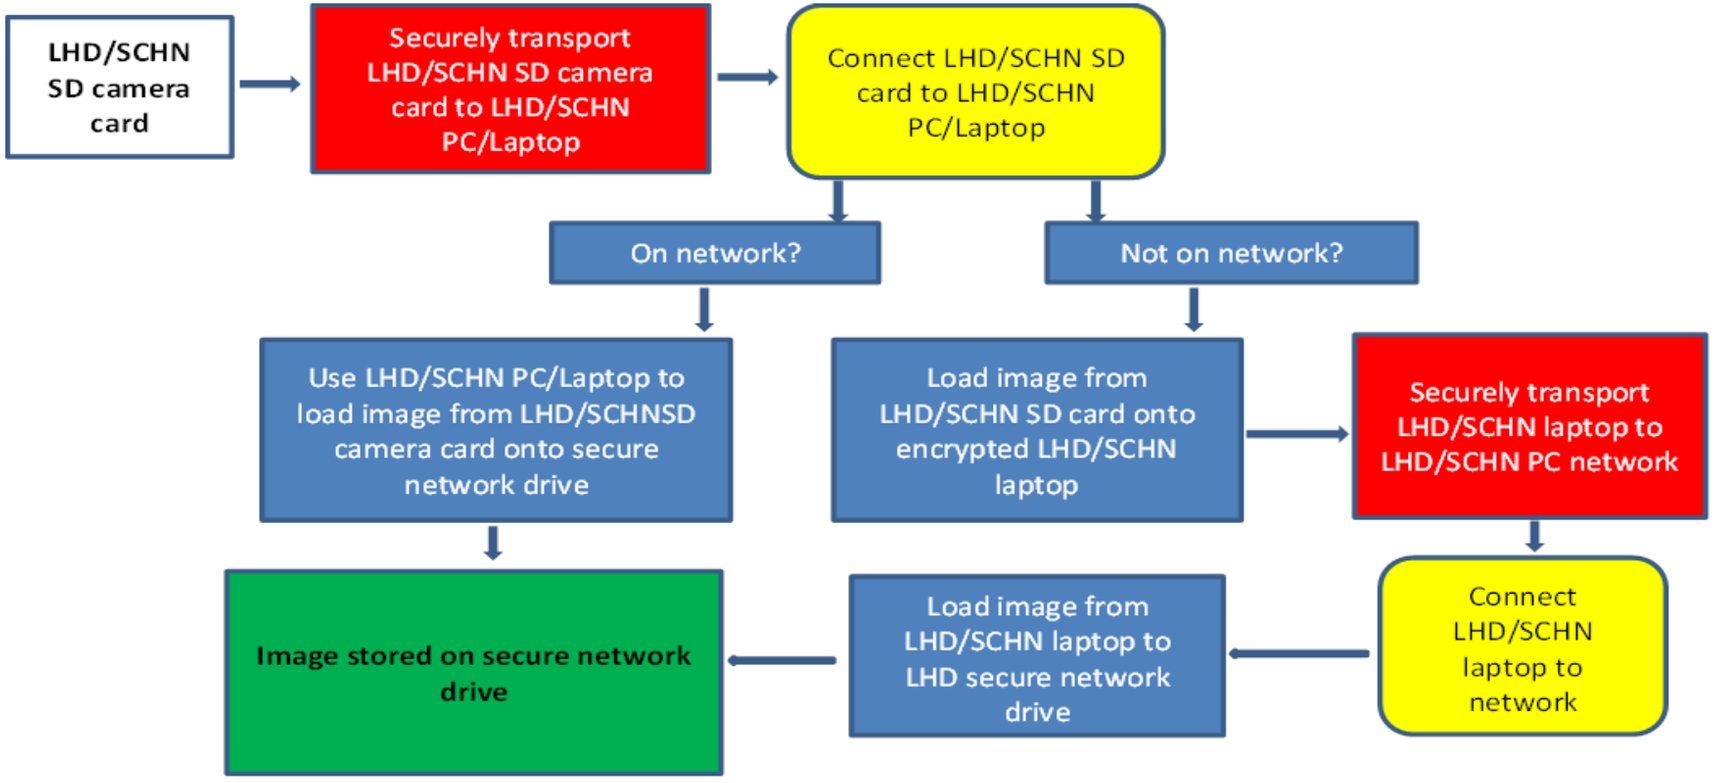
Standard: Images are stored securely and separately from the principal health care record, to maintain patient privacy

LHDs/SCHN must support NSW Health workers to comply with 2.6.1 to 2.6.6 below.

2.6.1 Transfer of images from the capture equipment to secure storage

NSW Health workers who capture and/or support the management of medical and forensic photo and video imaging in cases of suspected child abuse must:

- Check the original images on the camera equipment/LHD removable memory device and:
  - Consider deleting those where at the time the examiner first views the image(s), in the opinion of the practitioner, it is not usable. For example, the image depicts surrounding context rather than the patient or the lighting or exposure impedes what is depicted. Caution must be exercised and where the practitioner is unsure the image must be retained
  - Delete those where the person that provided consent for imaging withdraws consent before completion of the examination
  - Where images are deleted, document the number of images that were deleted and for each image, the reason why it was deleted
- Transfer the retained original image/s from the capture equipment/LHD removable memory device to LHD/SCHN secure network storage facilities as soon as possible and usually within one working day (see Figure 1)
- Archive retained original image/s. A ’read only' format or the equivalent facility is preferred to ensure the integrity of the original image/s and restrict the potential for editing
- Use a separate working copy of an original image for any editing that might be required
- Check images have successfully transferred to LHD/SCHN secure network storage facilities and then delete images that are left on the camera equipment/LHD removable memory device
- Periodically format capture camera equipment/LHD removable memory devices to ensure data recovery processes cannot be used to recover deleted images: Where a removable memory device per patient is used, such as in personal or non-dedicated cameras, formatting must occur as soon as possible after transfer to LHD/SCHN secure network storage facilities and usually within one working day
- Act in accordance with the NSW Health Electronic Information Security Policy, 2013, NSW Government Digital Information Security Policy, 2015, NSW Health: Health Care Records – Documentation and Management policy, 2012 and the NSW Health Privacy Manual for Health Information, 2015.



LHD/SCHN SD camera card
Securely transport LHD/SCHN SD camera card to LHD/SCHN PC/Laptop
Connect LHD/SCHN SD card to LHD/SCHN PC/Laptop
On network?
Not on network?
Use LHD/SCHN PC/Laptop to load image from LHD/SCHNSD camera card onto secure network drive
Load image from LHD/SCHN SD card onto encrypted LHD/SCHN laptop
Securely transport LHD/SCHN laptop to LHD/SCHN PC network
Image stored on secure network drive
Load image from LHD/SCHN laptop to LHD secure network drive
Connect LHD/SCHN laptop to network

2.6.2 Storage of images

NSW Health workers who capture and/or support the storage and management of medical and forensic photo and video imaging in cases of suspected child abuse must act in accordance with the NSW Health Electronic Information Security Policy, 2013, NSW Government Digital Information Security Policy, 2015, NSW Health: Health Care Records – Documentation and Management policy, 2012 and the NSW Health Privacy Manual for Health Information, 2015.

Photo and video imaging in cases of suspected child abuse, together with the medical records associated with the imaging, must be stored securely and separately from a child or young person's principal health care record.

LHD/SCHN secure storage facilities may be within a Child Protection Unit, Sexual Assault Service, an Emergency Department or other LHD/SCHN facility offering medical and forensic examinations.

All original photo and video images and any separate working copies used for editing must be stored on LHD/SCHN owned restricted secure network drives. Such restriction(s) to be determined by the Chief Executive Officer, or officer delegated responsibility for the security of LHD?SCHN medical records relating to cases of suspected child abuse.

Where LHD/SCHN owned restricted, secure network drives are not immediately available, in some remote areas for example, electronic/digital photo and video imaging must be:

- Transferred from the camera equipment/removable memory device to an LHD/SCHN owned laptop using appropriate safeguards, such as password or PIN codes, together with encryption technology (see Figure 1)
- Kept in lockable facilities with restricted access.

It is preferred that original images are stored using a 'read only' format, or equivalent, and images must be maintained in an original state and not subject to processes that cause permanent alteration.

All hard copy images must be stored securely in LHD/SCHN owned lockable facilities with restricted access. Such restriction(s) to be determined by the Chief Executive Officer, or officer delegated responsibility for the security of LHD/SCHN medical records relating to cases of suspected child abuse.

To maintain the integrity of the images in the event of legal action, images must be stored with:

- A copy of the consent form and documentation that includes the name of the photographer, the date and time the image/s were taken, and the location where the images were taken (see section 2.4.2)
- Accompanying documentation that includes a child or young person's initials, Medical Record Number (MRN) and/or Area Unique Identifier (AUID), date of birth (DOB), the date the images were captured and the name of the treating physician
- A reference that identifies the existence of any other relevant health related records or documents that are kept separately from the images, such as the location of the principal health care record. The images can be linked to the principal health care record via a notation on the principal record that a 'confidential health record exists'.

The restricted access electronic and hard copy storage facilities must have an auditing or tracking procedure that documents:

- Who, other than restricted access workers, views an image
- When an image leaves the location where it is stored and its destination
- When an image is copied and by whom.

2.6.3 Transmission of images

For the purpose of security and patient privacy, NSW Health workers involved in the transmission of medical and forensic photo and video imaging in cases of suspected child abuse must act in accordance with the NSW Health Electronic Information Security Policy, 2013, NSW Government Digital Information Security Policy, 2015, NSW Health: Health Care Records – Documentation and Management policy, 2012 and the NSW Health Privacy Manual for Health Information, 2015 and:

- Restrict access to images as described in section 2.7 of this policy directive
- Obtain authorised written permission to release/transmit a copy of an image from a senior member of NSW Health staff, such as the attending medical and forensic practitioner, health information manager or a senior medical records officer/manager. Archived original image(s) should be retained as described in section 2.6.1 of this policy
- Document the authorised permission for release/transmission in the patient's medical record and:
  - The details of the request for release, including the reason for release
  - The number and type of images released
  - The date
  - The person/recipient to whom the image/s have been released
  - Full details of the address/location that the image/s were sent to.

Within NSW Health

- Consideration must first be given to restricted party viewing of the images at the NSW Health source site.
- Where this is not possible and electronic transmission occurs, it must occur:
  - Within NSW Health email
  - From NSW Health email accounts to another recognised NSW Health address
  - Using appropriate safeguards such as encryption technology, password or PIN codes and delivery/receipt confirmations, where available
  - From LHD/SCHN owned computers, equipment or devices or those that are authenticated and authorised by the LHD/SCHN with connectivity protected by approved controls or, through NSW Health Secure File Transfer solutions.

In all cases consider whether it is feasible to remove or abbreviate patient identifiers on the image and in any subject lines whilst the image is in transit in liaison with the recipient.

External to NSW Health

Where it is necessary to release images to restricted parties outside NSW Health, such as the court or under rigorously restricted information sharing practices relating to Chapter 16A and Section 248 of the *Children and Young Persons (Care and Protection) Act* 1998 (see section 2.7.1 to 2.7.4 for details of permitted access):

- Consideration must first be given to restricted party viewing of the images at the NSW Health source site
- Where this is not possible:
  - Electronic copy/copies on a removable memory device under strict governance and control using appropriate security safeguards such as encryption technology, password or PIN codes, or where this is not possible
  - Hard copy/copies

should be transported sealed in an appropriately robust sealed envelope (or similar package) with a unique number allocated from a register held by the NSW Health source site.

The envelope/package should be delivered by hand by an employee of NSW Health, registered post or courier and a receipt should be obtained.

At no time must a portable or removable device be used if it is not securely encrypted and released using these safeguards.

- Where this is not possible it should be noted that electronic transmission of personal health information to destinations external to NSW Health are not considered secure (NSW Health Privacy Manual for Health Information, 2015) and where electronic transmission is necessary, the following must occur:
  - Appropriate safeguards must be used such as encryption technology, password or PIN codes and where available, delivery/receipt confirmations
  - LHD/SCHN owned computers, equipment or devices or those that are authenticated and authorised by the LHD/SCHN with connectivity protected by approved controls must be used.

In all cases consider whether it is feasible to remove or abbreviate patient identifiers on the image and in any subject lines whilst the image is in transit in liaison with the recipient. Images must never be emailed or uploaded via the internet to cloud services. Personal email accounts must never be used to transmit patient information.

- Communication using File Transfer Protocol (FTP), telnet, Mobile SMS, instant messaging and web traffic (HTTP) is not permitted by NSW Health as a secure process for sharing photo and video imaging (NSW Health Electronic Information Security Policy, 2013).

2.6.4 Ownership and copyright

Images, recordings and documentation produced by NSW Health workers in a NSW Health service facility remain the property of the health service, including those taken by visiting medical officers.

Copyright of all recordings is owned by the State of New South Wales through the Local Health District/Speciality Network.

2.6.5 Destruction of images and medical record information

An original image on the camera equipment/device may be deleted in accordance with section 2.6.1 of this policy directive.

In all other cases, NSW Health workers must act in accordance with the NSW Government General Retention and Disposal Authority policy, 2004 (revised, 2011) and retain images for a minimum of 30 years after legal action is completed and resolved (where known), *or* after last contact for legal access *or* 30 years after the individual attains *or* would have attained the age of 18 years, whichever is the longer.

2.6.6 Images received from external sources

With the exception of formal, professional clinical peer group requests, review of an image sent to a practitioner from any other source, for example, a family member, in the context of investigating allegations of child abuse needs to be carefully managed. Offering an opinion on such images needs to done with caution because the practitioner may be exposed to various risks, including difficulties arising from the quality of the image, uncertainties about the date and time it was captured, the identity of the person depicted in the image(s) and an inability to document a clear chain of evidence. In these circumstances:

- Where a person depicted in an image has not been examined by an appropriate practitioner, a NSW Health practitioner that receives the image must not provide advice based solely on the image
- The image should be retained as a record of a request for review, stored separately from images that the examiner has captured and include a notation with full details of the request (for example, the source and date) and any response.

2.7 Access to images for relevant purposes

Standard: Restricted access is provided to images, to maintain patient privacy

LHDs/SCHN must ensure that NSW Health workers comply with 2.7.1 to 2.7.5 below.

2.7.1 Permitted access

NSW Health workers who capture and/or support the management of medical and forensic photo and video imaging in cases of suspected child abuse must ensure that access is restricted to:

- Designated NSW Health workers providing treatment to children or young people or involved in their safety who have unique user identification, individual password authentication and permission controls
- Circumstances where:
  - It is reasonably necessary, and directly associated with the primary purpose/s of collection and
  - The patient/their parent(s)/guardian(s) would reasonably expect the information to be used for that purpose, or
  - Separate informed consent has been obtained for the purpose of a) teaching and/or b) research activities
- The patient or their parent(s)/guardian(s), unless release would affect the personal affairs of any person, including a request by a parent or guardian where such access may lead to child abuse or prejudice a child's physical or mental health. Caution must be exercised and an interpretation and explanation of the clinical findings is preferable to the provision of access to images
- Approved teaching and/or research activities (section 2.8) where:
  - the young person and/or their parent/guardian has provided separate informed consent, and
  - images are de-identified and anonymity of patients is maintained, and
  - the teaching and/or research activities are compliant with the NSW Health Privacy Manual for Health Information, 2015 and other relevant NSW Health policies and the research has received ethical approval (for example, see https://hrep.nhmrc.gov.au/certification/hrecs, http://www.ahmrc.org.au/ethics.php and www.ipc.nsw.gov.au/statutory-guidelines-research-purposes-pdf), and
  - electronic and digital information is used in accordance NSW Health Electronic Information Security Policy, 2013 and NSW Government Digital Information Security Policy, 2015
- Quality improvement activities (section 2.9) where:
  - images are de-identified and anonymity of patients is maintained, and
  - Human Research Ethics Committees – Quality Improvement & Ethical Review: A Practice Guide for NSW is used to help to determine the activity, and
  - the quality improvement activities are compliant with NSW Health Privacy Manual for Health Information, 2015 and other relevant NSW Health policies.
- Information sharing under Chapter 16A and Section 248 of the *Children and Young Persons (Care and Protection) Act* 1998 (sections 2.72 and 2.7.3)
- Requests under a court subpoena (see section 2.7.4)
- The requirements of the Health Privacy Principles NSW Health Privacy Manual for Health Information, 2015.

Where access to images is deemed necessary, consideration must be given to viewing the images at the NSW Health source site.

Where release is deemed necessary it should be restricted to the above circumstances and integrity of security must be maintained in accordance with section 2.6.3 of this policy directive and NSW Health Electronic Information Security Policy, 2013, NSW Government Digital Information Security Policy, 2015, the NSW Health Privacy Manual for Health Information, 2015 and NSW Health: Health Care Records – Documentation and Management policy, 2012.

2.7.2 Information sharing under Chapter 16A of the Children and Young Persons (Care and Protection) Act 1998

Chapter 16A establishes a scheme for sharing information relating to the safety, welfare or wellbeing of children and young persons between prescribed bodies.

All applications and requests for access to photo and video imaging under Chapter 16A must be forwarded to an appropriate Health worker, medical and forensic examiner involved in the case, manager of the relevant service that authorised the images to be taken (e.g. Sexual Assault Service, Child Protection Unit, Emergency Department or Paediatric Unit), or LHD/SCHN Central Contact Point, regardless of the author of the recording.

The LHD/SCHN will provide a medical report or Expert Certificate to summarise findings to support investigation, assessment, decision making and coordination of services. Access to images of ano-genital, breast/chest and other sensitive areas of the body must be rigorously restricted and considered in the context that such images can only be interpreted by qualified medical and forensic examiners.

Consideration must be given to the relevance of access to or release of photo and video imaging relating to suspected physical abuse and neglect to prescribed bodies for the purpose of the safety, welfare or wellbeing of the child or young person. Where a request is granted, accompanying interpretation or explanation of clinical findings must also be provided.

- Where a medical examination has taken place in accordance with Section 173 of the *Children and Young Persons (Care and Protection) Act* 1998 a medical report is provided for the Secretary of Family and Community Services (FACS). An existing Expert Certificate could also be provided.

2.7.3 Information sharing under Section 248 of the Children and Young Persons (Care and Protection) Act 1998

Section 248 governs the exchange of information relating to the safety, welfare and wellbeing of children and young people between the Department of Family and Community Services and prescribed bodies

Requests under Section 248 should be directed to the LHD/SCHN Central Contact Point and come from the Secretary, Family and Community Services (or delegate).

Under Section 248 FACS can request access to a child or young person's medical record, which includes the Child Sexual Assault Medical Protocol/SAIK and Suspected Child Abuse and Neglect (SCAN) Medical Protocol, 2014. The LHD/SCHN will provide a medical report or Expert Certificate to summarise findings to support investigation, assessment, decision making and coordination of services. Access to images of ano-genital, breast/chest and other sensitive areas of the body must be rigorously restricted and considered in the context that such images can only be interpreted by qualified medical and forensic examiners.

Consideration must be given to the relevance of access or release of photo and video imaging relating to suspected physical abuse and neglect to the Secretary of the Department of Family and Community Services and prescribed bodies for the purpose of the safety, wellbeing and welfare of the child or young person. Where a request is granted, accompanying interpretation or explanation of clinical findings must also be provided.

Where a medical examination has taken place in accordance with Section 173 of the *Children and Young Persons (Care and Protection) Act* 1998 a medical report is provided for the Secretary of FACS. An existing Expert Certificate could also be provided.

2.7.4 Subpoenas

For the purpose of a subpoena, a 'document' includes 'an electronic medical record or information contained on a computer file, such as photos and/or video' (NSW Health Subpoenas policy, 2010) and

For the purpose of this policy directive a photo or video image captured in a case of suspected sexual abuse, physical abuse or neglect, constitutes a 'sensitive record' (section 4.3: NSW Health Subpoenas policy, 2010).

LHDs/SCHN must act in accordance with the NSW Health Subpoenas policy, 2010, and ensure that the LHD/SCHN designated officer (e.g. medical records health information manager or medico-legal officer or risk manager) is informed about the subpoena, as well as, where possible, the senior health care provider and treating health care provider.

NSW Health workers who manage subpoenas must:

- Be aware of whether any claim for privilege over the images can be applied and take appropriate action
- Follow the precautions for 'sensitive records' (see section 6.4: NSW Health Subpoenas policy, 2010)
- Where images are produced, provide only those that are captured under the schedule of the subpoena
- Retain a copy of the subpoena and the images that the Health service provided under the subpoena.

Where the patient whose records are subpoenaed are not a party to the proceedings before the court, the LHD/SCHN must notify the patient:

- That the subpoena has been received
- The date that the photo/video imaging must be provided to the court, so that the patient can arrange to attend court if they so wish.

2.7.5 Sexual assault communications privilege

Records relating to the counselling of victims of sexual abuse may be protected from production to the court. Photo and video imaging is not covered under this privilege (see Chapter 6 of the *Criminal Procedure Act* 1986).

2.8 Use of imaging for teaching and research

LHDs/SCHN must ensure that NSW Health workers comply with the following:

- Specific informed consent must be obtained from the young person or their parent(s)/guardian(s) for de-identified photo and video imaging to be used for a) teaching and/or b) approved research activities. This must include an explanation that consent for future teaching and/or approved research activities may be withdrawn by the person who provided consent or the person depicted in the image(s) once they are Gillick competent

  For this purpose, where consent is provided for de-identified images to be used for the purposes of teaching and/or approved research activities there must be a process to ensure that withdrawal of consent may be withdrawn. An example of good practice is described in Appendix 5.8

- Anonymity of patients must be maintained during case presentations, demonstrations, teaching, research and at seminars and conferences. Where possible, fictitious data must be used and identification of individuals must not occur. Use of images that would identify the child or young person must not occur. Images of the face must be de-identified and use of blocked sections or cropping, for example, could be used for this purpose

- Research must abide by relevant NSW Health policies and be approved by a Research Ethics Committee (for example, see https://hrep.nhmrc.gov.au/certification/hrecs, http://www.ahmrc.org.au/ethics.php and www.ipc.nsw.gov.au/statutory-guidelines-research-purposes-pdf)

- Act in accordance with the NSW Health Privacy Manual for Health Information, 2015.

9. HEALTH RECORDS AND INFORMATION

2.9 Use of imaging for quality improvement activities

LHDs/SCHN must ensure that NSW Health workers comply with the following:

- Quality improvement activities must:
  - use de-identified images and maintain anonymity of patients, and
  - be determined by reference to Human Research Ethics Committees – Quality Improvement & Ethical Review: A Practice Guide for NSW, and
  - comply with NSW Health Privacy Manual for Health Information, 2015 and other relevant NSW Health policies.

2.10 Maintaining the integrity of images in the longer-term

Standard: The integrity of images is maintained in the longer-term

The extent and range of digital image capturing devices, communication technologies and storage systems create a complex environment and significant challenges and opportunities for those that provide forensic science services and their patients (Australia New Zealand Policing Advisory Agency, 2013).

- LHDs/SCHN must use risk analysis and management techniques to reassess the procedures used for capture, storage, access and security for the purpose of maintaining the integrity of images in the longer term. (See, for example, NSW Health Electronic Information Security Policy, 2013, NSW Government Digital Information Security Policy, 2015, and NSW Health: Health Care Records – Documentation and Management policy, 2012.)

9. HEALTH RECORDS AND INFORMATION

Glossary

Capture	Capture is the process of recording (acquiring) data, such as an image or video sequence (Australia New Zealand Policing Advisory Agency, 2013).
Child Sexual Assault Medical Protocol (the written protocol in the Sexual Assault Investigation Kit (SAIK))	A written record used by forensic examiners in NSW Health Sexual Assault Services to record all types of sexual abuse examinations for children 0-14 years of age and, where appropriate, may be used for young people 14 -17 years, otherwise an adult Medical and Forensic Examination Record (MFER) may be used. It is part of the Child Sexual Assault Investigation Kit (SAIK). The Adult Sexual Assault Medical Protocol may be used where a young person aged 14 or above attends an adult Sexual Assault Service. In young people aged 14 to 17, which Protocol is used is contingent upon consideration of the circumstances of the child or young person and whether a child or adult SAIK represents the most appropriate pathway. The Protocols provide guidance to facilitate the medical and forensic examination of victims of sexual abuse and ensure that laboratory specimens are collected correctly and legal requirements are fulfilled.
Children and young people	Child: A person who is under the age of 16 years. Young person: A person who is aged 16 years or above but who is under the age of 18 years. (Section 3. *Children and Young Persons (Care and Protection) Act* 1998).
Colposcope	A lighted, magnifying medical instrument used to examine the tissues of the genitalia. It allows an examiner to take a closer look at a child or young person's genitalia and check for abnormal areas. Some devices can be fitted with photographic or video equipment that can capture still (photographic) or moving (video) images.
Cultural competence	Violence, trauma and neglect occur in culturally diverse contexts. Cultural competence is the ability to identify and challenge one's own cultural assumptions, values and beliefs. It is about developing empathy and appreciating that there are many different ways of viewing the world, as this is influenced by culture.
FACS	Department of Family and Community Services
Gillick competence	Whilst parents, or those having parental responsibility rights, generally have the legal authority to provide consent for medical procedures for children and young people under the age of 16 years, the Gillick principle (1985 decision of the House of Lords in Gillick v West Norfolk and Wisbech Area Health Authority and anor) provides that a child's competence to consent to medical procedures increases as they approach maturity, that is a minor under the age of 16 years may be capable of independently consenting to medical treatment when they have achieved a sufficient level of understanding and intelligence to enable them to fully understand what is proposed. Medical practitioners must decide on a case-by- case basis whether a minor has achieved this level of understanding and intelligence.
Guardian	A person with 'parental responsibility' as defined in Section 79A of the *Children and Young Persons (Care and Protection) Act* 1998.
HRIPA	*Health Records and Information Privacy Act* 2002. The Health Privacy Principles (or HPPs) contained in the HRIP Act establish 15 rules for the management of information.

9. HEALTH RECORDS AND INFORMATION

Intimate image	A photo or video image depicting the genitalia, anus or post-pubertal female breast (Faculty of Forensic & Legal Medicine, 2014) and may also include other parts of the body, such as the buttocks or chest of a pre-pubertal child.
JIRT (Joint Investigation Response Team)	JIRT is a collaborative partnership between the Department of Family and Community Services, the NSW Police Force and NSW Health workers that jointly manages statutory child protection matters that may require a criminal justice response and a health response.
JPEG	A digital compression and coding standard (Australia New Zealand Policing Advisory Agency, 2013).
JRU (JIRT Referral Unit)	JRU is comprised of professionals from the Department of Family and Community Services, the NSW Police Force and NSW Health and ensures that reports of risk of significant harm of children and young people to the Child Protection Helpline that require a child protection response, and may require a health and criminal justice response, are jointly assessed for a response by the three JIRT partner agencies.
LHD	Local Health District.
Medical and forensic examiner	A trained Medical Officer, Sexual Assault Nurse Examiner (SANE) or Forensic Nurse who has specialised education and clinical experience in the treatment of children and young people who may have experienced child sexual abuse, physical abuse or neglect and the collection of forensic evidence.
Medical and forensic examination	A medical and forensic examination is an examination of a patient for the purpose of providing medical care and collecting forensic documentation and evidence.
Neglect	Where a child or young person's basic needs (e.g. supervision, medical care, nutrition, shelter and education) have not been met, or are at risk of not being met, to such an extent that it can reasonably be expected to have a significant adverse impact on the child or young person's safety, welfare or well-being. This lack of care could be constituted by a single act or omission or a pattern of acts or omissions such as failing to attend medical appointments or failing to ensure that a school age child attends school. (Child Wellbeing and Child Protection Policies and Procedures for NSW Health, 2013).
ODPP	Office of the Director of Public Prosecutions.
Original image	The first image that is captured onto any media.
Peer review	The evaluation of work or performance by colleagues in the same field with the aim of maintaining or enhancing the quality of work or performance in that field (Faculty of Forensic & Legal Medicine, 2014a). It includes: • Discussion about clinical decision making and interpretation of examination findings and results of investigations • Meetings undertaken by and with peers with the aim of updating knowledge and improving practice through presenting of work to peers for review (Medical Board of Australia, 2014a).
Personal device	A personal device is one which is not owned by a NSW Health Public Health Organisation. Examples of a personal mobile device include a phone, camera, ipad or other tablet and laptop computer.

9. HEALTH RECORDS AND INFORMATION

Photo and video imaging	Photo and video imaging depicts an image that: Documents the findings of a medical or forensic examination Is captured, recorded and in some cases, transmitted for clinical or forensic purposes Exists in live 'real time' or is stored in hard copy or electronic form Can be transmitted in real time or stored and transmitted at a later point in time May become evidence in a legal proceeding. Photo and video imaging can be captured using a camera or video recorder. Both can be used in conjunction with a colposcope to enhance magnification and lighting. For the purpose of this policy, photo and video imaging constitutes part of a health care record.
Physical abuse	Physical abuse occurs if a child or young person sustains a non-accidental injury or is being treated in a way that may have or is likely to cause injury. The injury may be inflicted by a parent, carer, guardian, other adult or other child or young person. (Child Wellbeing and Child Protection Policies and Procedures for NSW Health, 2013).
Prescribed body	Chapter 16A of the *Children and Young Persons (Care and Protection) Act* 1998 establishes a scheme for sharing information relating to the safety, welfare or wellbeing of children and young persons between prescribed bodies. A 'prescribed body' is any organisation specified in Section 248 (6), *Children and Young Persons (Care and Protection) Act* 1998 or in clause 7, *Children and Young Persons (Care and Protection) Regulation*, 2000, or in clause 8, *Children and Young Persons (Care and Protection) Regulation*, 2012.
Public Health Organisation	A 'Public Health Organisation' is: A local health district, or A statutory health corporation, or An affiliated health organisation in respect of its recognised establishments and recognised services. Section 7. *Health Services Act 1997*.
SAIK	Sexual Assault Investigation Kit (see 'Child Sexual Assault Medical Protocol').
SCAN Protocol	Suspected Child Abuse and Neglect (SCAN) Medical Protocol, 2014.
SCHN (Sydney Children's Hospitals Network)	The Sydney Children's Hospitals Network comprises The Children's Hospital at Westmead, Sydney Children's Hospital, Randwick, Bear Cottage, the Newborn and Paediatric Emergency Transport Service (NETS), the Pregnancy and Newborn Services Network (PSN) and the Children's Court Clinic.
Sexual abuse	The terms sexual abuse and sexual assault are often used interchangeably. For the purposes of this policy directive 'sexual abuse' is used to refer to sexual activity or behaviour that is imposed, or is likely to be imposed, on a child or young person by another person (Child Wellbeing and Child Protection Policies and Procedures for NSW Health, 2013).
Sexual assault	See 'sexual abuse'.

Sexual Assault Communications Privilege (SACP)	As set out in the Criminal Procedure Act 1986, the SACP allows courts to exclude evidence that would disclose confidential communications made in the course of a professional or sexual abuse counselling relationship. See Appendix A of the NSW Health Subpoenas policy, 2010, for further information.
Standard	A standard is a key principle that must be followed.
Subpoena	A subpoena is an order from a court or tribunal which directs someone that they must on a given date: a) Produce to a court certain (existing) documents for use in legal proceedings b) Attend a court on a particular date to be a witness in a hearing and give evidence, or c) Do both. A subpoena can only be issued if legal proceedings have been commenced. For the purposes of a subpoena a 'document' includes, 'an electronic medical record or information contained on a computer file, such as photos and/or video' (NSW Health Subpoenas policy, 2010).
Telehealth	Telehealth is the delivery of health care at a distance using information and communications technology (Wade (2014). Available at http://www.e-unicare.com.au/wp-content/uploads/2013/06/unicare_ebook.pdf

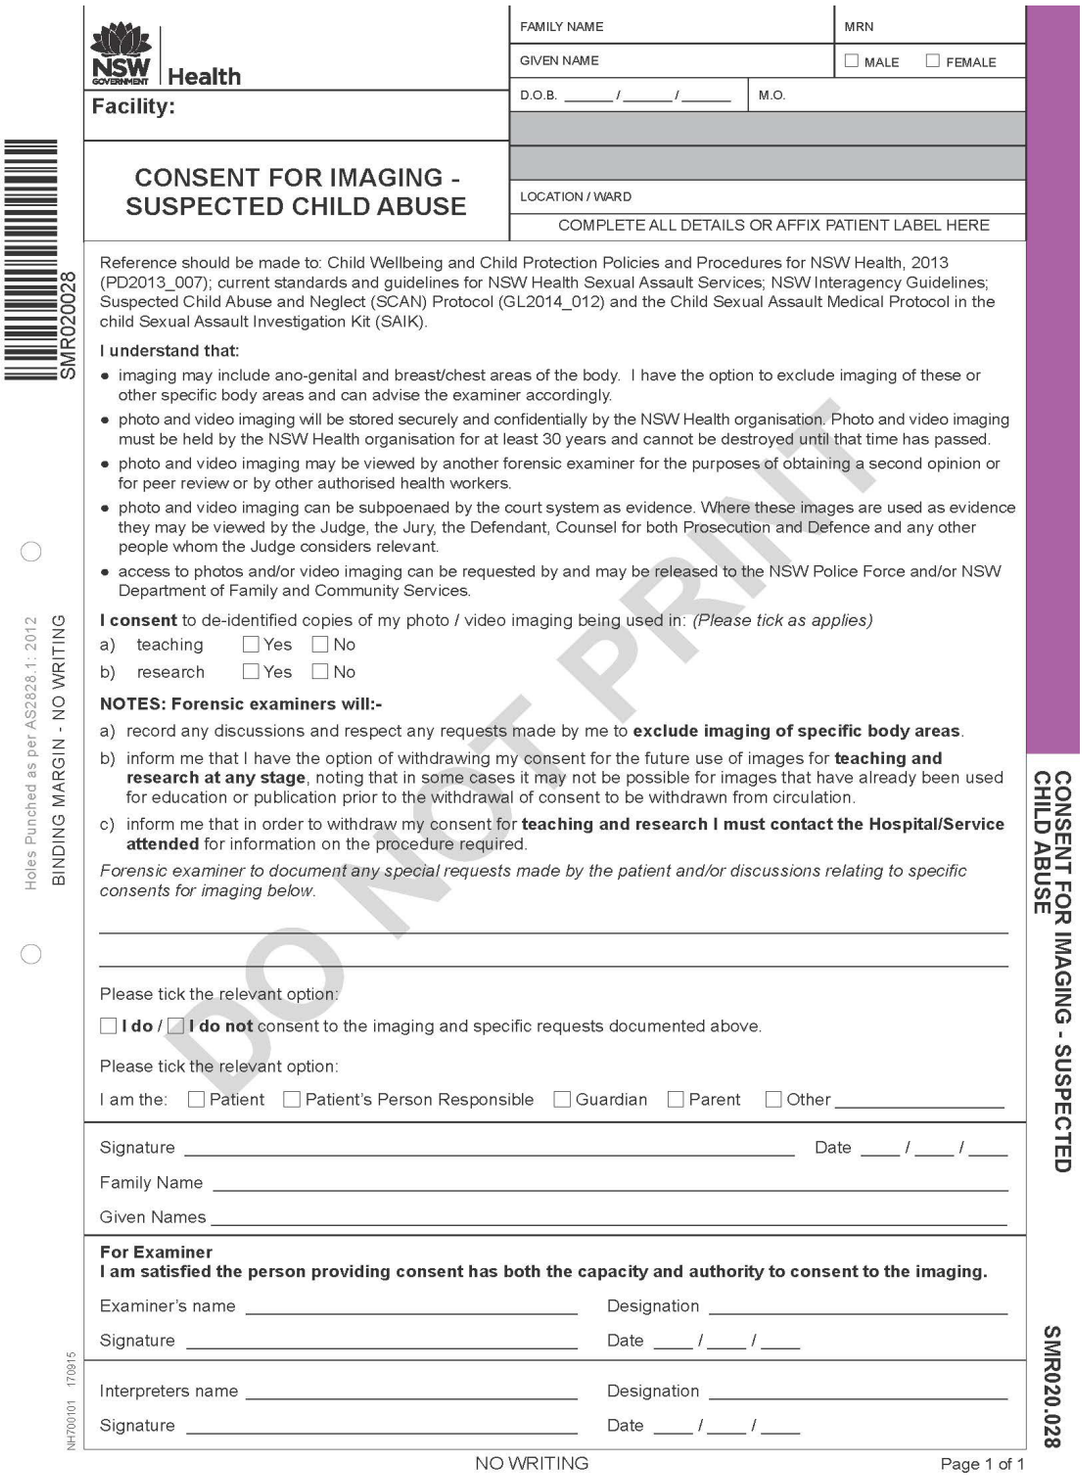
5.6 Interim NSW Health consent form



NSW GOVERNMENT Health

Facility:

CONSENT FOR IMAGING - SUSPECTED CHILD ABUSE

FAMILY NAME | MRN

GIVEN NAME | ☐ MALE ☐ FEMALE

D.O.B. _____ / _____ / _____ | M.O.

LOCATION / WARD

COMPLETE ALL DETAILS OR AFFIX PATIENT LABEL HERE

SMR020028

Reference should be made to: Child Wellbeing and Child Protection Policies and Procedures for NSW Health, 2013 (PD2013_007); current standards and guidelines for NSW Health Sexual Assault Services; NSW Interagency Guidelines; Suspected Child Abuse and Neglect (SCAN) Protocol (GL2014_012) and the Child Sexual Assault Medical Protocol in the child Sexual Assault Investigation Kit (SAIK).

I understand that:

- imaging may include ano-genital and breast/chest areas of the body. I have the option to exclude imaging of these or other specific body areas and can advise the examiner accordingly.
- photo and video imaging will be stored securely and confidentially by the NSW Health organisation. Photo and video imaging must be held by the NSW Health organisation for at least 30 years and cannot be destroyed until that time has passed.
- photo and video imaging may be viewed by another forensic examiner for the purposes of obtaining a second opinion or for peer review or by other authorised health workers.
- photo and video imaging can be subpoenaed by the court system as evidence. Where these images are used as evidence they may be viewed by the Judge, the Jury, the Defendant, Counsel for both Prosecution and Defence and any other people whom the Judge considers relevant.
- access to photos and/or video imaging can be requested by and may be released to the NSW Police Force and/or NSW Department of Family and Community Services.

I consent to de-identified copies of my photo / video imaging being used in: *(Please tick as applies)*

a) teaching ☐ Yes ☐ No

b) research ☐ Yes ☐ No

NOTES: Forensic examiners will:-

a) record any discussions and respect any requests made by me to **exclude imaging of specific body areas**.

b) inform me that I have the option of withdrawing my consent for the future use of images for **teaching and research at any stage**, noting that in some cases it may not be possible for images that have already been used for education or publication prior to the withdrawal of consent to be withdrawn from circulation.

c) inform me that in order to withdraw my consent for **teaching and research I must contact the Hospital/Service attended** for information on the procedure required.

Forensic examiner to document any special requests made by the patient and/or discussions relating to specific consents for imaging below.

_____

_____

Please tick the relevant option:

☐ **I do** / ☐ **I do not** consent to the imaging and specific requests documented above.

Please tick the relevant option:

I am the: ☐ Patient ☐ Patient's Person Responsible ☐ Guardian ☐ Parent ☐ Other _____

Signature _____ Date ____ / ____ / ____

Family Name _____

Given Names _____

For Examiner
I am satisfied the person providing consent has both the capacity and authority to consent to the imaging.

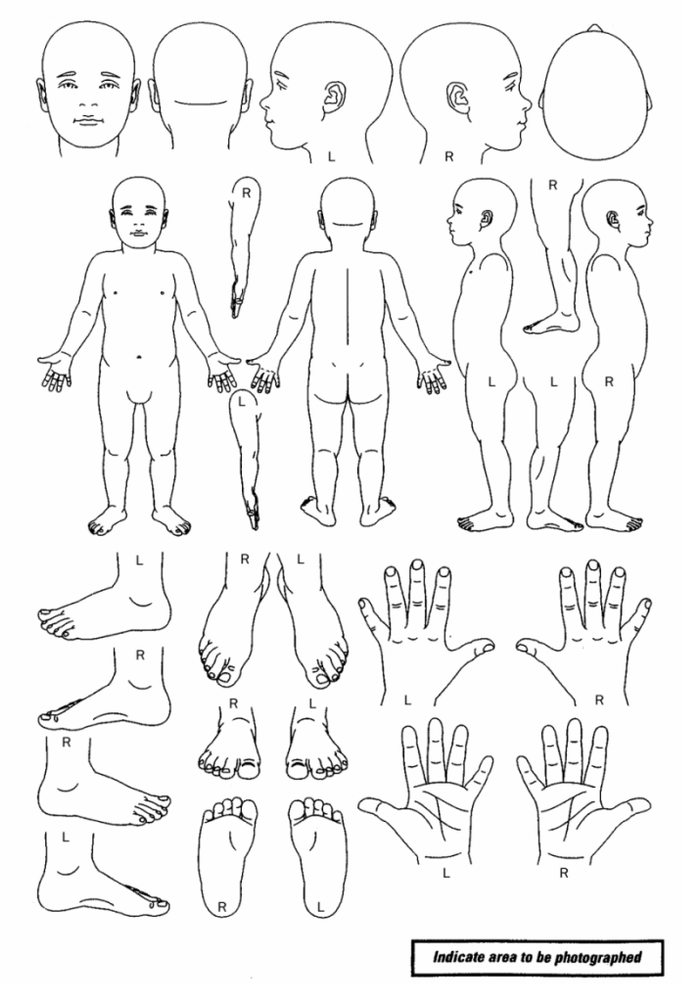
5.7 Request for Medical Photography Services

Consent must be sought before sending this form to the medical photographer.

Request for Medical Photography Services (to be completed by Health Professional requesting service)	
Requester	Diagnosis (If known/please print)
Designation/Department	Location of patient (Outpatient, Inpatient or Ward)
Signature (of Requester)	Date of Request

Type of request	Instructions to photographer (indicate area to be photographed below)
Case history print ☐	
Digital file ☐	
Colour prints ☐	
Black and white prints ☐	
Video/audio ☐	

Name of Reporter/Photographer:



5.8 Good practice example of a process for complying with a withdrawal of consent for de-identified images to be used for future a) teaching and/or b) research activities

For the purpose of complying with a withdrawal of consent for de-identified images to be used for future a) teaching and/or b) approved research activities:

On receipt of consent

- Each de-identified image should be assigned a reference notation
- The reference notation should be recorded in the patient's file
- A register should be:
  - Kept to document and link the reference notation of the de-identified image with the patient file and
  - Maintained for a minimum of 30 years (NSW Government General Retention and Disposal Authority policy, 2004, revised, 2011)
- A copy of the consent must be stored with the de-identified image(s).

On receipt of a withdrawal of consent, for the purpose of compliance and risk analyses, the de-identified image/s must be deleted from:

- Files that are kept and used for the purposes of future teaching and/or research
- Existing training materials, including Powerpoint files, where they are known to exist.

ADOPTION ACT 2000 – RELEASE OF INFORMATION (PD2016_036)

PD2016_036 rescinds PD2010_050

PURPOSE

This Policy Directive provides:

- Information regarding the rights of adopted persons and their families to access information held by Information Sources under the *Adoption Act 2000*
- NSW Health Information Sources with direction and guidance as to what information should be disclosed to adopted persons and their families and the circumstances in which it should be disclosed.

MANDATORY REQUIREMENTS

Each NSW Health Information Source must have effective systems and procedures in place to ensure adopted persons and their families can access information in accordance with the *Adoption Act 2000* and this Policy Directive.

IMPLEMENTATION

Roles and Responsibilities

Chief Executives must ensure:

- The principles and requirements of this Policy Directive are applied, achieved and sustained
- Their medical record staff are made aware of this Policy Directive.

Medical record staff have responsibility to:

- Be aware of this Policy Directive
- Release information to adopted person and their families in accordance with this Policy Directive and the *Adoption Act 2000*.

BACKGROUND

About this document

The *Adoption Act 2000* is administered by the Department of Family and Community Services and sets out the information to which adoptees and their families are entitled to access and the manner in which a person may access that information.

Under the *Adoption Act 2000*, adopted persons, adoptive parents and birth parents are entitled to access prescribed information held by an "Information Source". An Information Source includes:

- The NSW Ministry of Health
- A public hospital under the control of a Local Health District
- A statutory health corporation
- An affiliated health organisation, and

- A private health facility.

This Policy Directive provides specific information on how information about adoptees and their families held by Information Sources should be disclosed.

1.2 Legal and legislative framework

Adoption Act 2000
Adoption Regulation 2015

2 GENERAL MATTERS

2.1 Persons making general enquiries

Telephone enquiries should be directed by switchboard to the medical records department. Persons making enquiries should be informed that the Adoption Information Unit of the Department of Family and Community Services offers services regarding past adoptions, including accessing information.

The Adoption Information Unit can be contacted on 1300 799 023 or via email at **adoption.information@facs.nsw.gov.au**.

Where an enquirer is seeking information held by the NSW Ministry of Health, a public hospital, a statutory health corporation or an affiliated health organisation, this Policy Directive, in conjunction with the Adoption Act 2000 should be complied with.

2.2 Search fees

An Information Source may charge a fee for disclosing information held by the Information Source. Information Sources should refer to PD2006_050 Health Records and Medical / Clinical Reports - Charging Policy in respect of the fees to be charged.

2.3 Information to be provided

Adopted persons, adoptive parents and birth parents are entitled to a variety of information held by an Information Source. This policy only deals with the release of information most likely to be commonly held by NSW Health Information Sources that is health information. If there are further records relating to the adopted person, adoptive parents or birth parents held by an Information Source, you should contact your legal advisor to determine whether the information should be released.

2.4 Proof of identify

Before any information under the Adoption Act 2000 is released to an individual, that individual should provide proof of their identity and, in cases where the individual is seeking information about another person, the individual should provide proof of their relationship to the other person, such as adoption order and birth certificate(s).

2.5 Birth Parents and presumptive fathers

In this policy, a reference to an adopted person's birth parent includes a reference to the "presumptive father" of the adopted person. Under the Adoption Act 2000, the presumptive father of an adopted person means a man who claims to be the birth parent of the adopted person and who:

(a) Is shown on the adopted person's original birth certificate as the adopted person's father, or

(b) Is a person whom the Information Source is entitled to presume under any law to be the adopted person's father.

If you are unsure whether a particular person is the presumptive father of an adopted person, you should contact your legal advisor.

In some cases, an individual man will be named as the "father" in the medical records but will not be named as the father on the adopted person's birth certificate. In these cases, the individual man's identifying information cannot be disclosed to any person. However, in such cases, the medical records department of the Information Source should consider providing the individual man's details to the Department of Family and Community Services who can determine whether the man would like to exchange information with the adopted person.

2.6 General guidelines for the release of information

Under s142 of the Adoption Act, an Information Source must comply with any guidelines prescribed by the Adoption Regulation before releasing information under the Act. Under clause 105 of the Adoption Regulation, the guidelines below must be complied with.

2.6.1 Confirmation of identity

The Information Source must make reasonable inquiries to confirm the applicant's identity and relationship to the person to whom the information relates.

2.6.2 Sensitive information

The Adoption Regulation has special guidelines in relation to "sensitive information". Sensitive information means:

(a) Information indicating that an adopted person was conceived as a result of incest or the sexual assault of his or her birth mother, and

(b) Information indicating that an adopted person has an hereditary condition seriously affecting the current, or that could seriously affect the future, physical or mental health of the adopted person or any descendant of the adopted person, and

(c) Information that could reasonably be expected to be distressing in nature to the person receiving the information.

Before disclosing sensitive information, the Information Source must:

- Make appropriate counselling and support available to the person, and
- Check whether the birth parent's name is entered in the Reunion and Information Register. If the birth parent's name is entered on the Reunion and Information Register, the Information Source must not disclose the sensitive information unless the Information Source has taken reasonable steps to ascertain whether the birth parent wishes to provide the information personally.

2.7 Supply Authority

Information may only be disclosed to an individual if that individual provides the Information Source with a Supply Authority issued by the Department of Family and Community Services if:

- The adoption occurred prior to 1 January 2010, or
- The adoption occurred after 1 January 2010 where the applicant is a birth parent or non-adopted sibling.

In some cases, where a Supply Authority is required before information can be released to an individual, that individual may instead produce to the Information Source an original or amended birth certificate issued under the *Adoption Information Act 1990* prior to October 1998 by the Registrar of Births Deaths and Marriages stamped with the words "Not for Official Use".

If the Information Source is unclear whether the Supply Authority or birth certificate is valid, the Adoption Information Unit should be contacted.

3 RELEASE OF INFORMATION

3.1 Request to access information regarding adoptions occurring on or after 1 January 2010

If an adoption took place on or after 1 January 2010, an adopted person, their adopted parents and birth parents and non-adopted siblings have rights to access information held by an Information Source, including the NSW Ministry of Health, a public hospital, a statutory health corporation or an affiliated health organisation.

3.1.1 Adopted person's rights

3.1.1 (a) Rights to access information by an adopted person who is over the age of 18

An adopted person who is over the age of 18, and was adopted on or after 1 January 2010, is entitled to receive:

- Information regarding the adopted person's birth details (including the time of birth and weight and length at birth) and other medical records about the adopted person, and
- Any non-identifying background information about the adopted person's birth parents, siblings, grandparents, aunts or uncles that will give the adopted person knowledge of his or her origins.

3.1.1 (b) Rights to access information by an adopted person who is under the age of 18

An adopted person who is under the age of 18, and who was adopted on or after 1 January 2010, is entitled to receive information only with the consent of the person's adoptive parents or the Secretary of the Department of Family and Community Services.

If the adopted person produces a written consent of their adoptive parents or the Secretary of the Department of Family and Community Services, the following information should be provided to the adopted person who is under the age of 18:

- Information regarding the adopted person's birth details (including the time of birth and weight and length at birth) and other medical records about the adopted person, and
- Any non-identifying background information about the adopted person's birth parent, sibling, grandparent, aunt or uncle that will give the adopted person knowledge of his or her origins.

3.1.2 Adoptive Parents' rights

An adoptive parent of an adopted person who was adopted on or after 1 January 2010 is entitled to receive the following information held by an Information Source:

- Information regarding the adopted person's birth details (including the time of birth and weight and length at birth), and
- Any non-identifying background information about the adopted person's birth parent, sibling, grandparent, aunt or uncle that will give the adoptive parent knowledge of the adopted person's origins.

3.1.3 Birth Parents' rights

3.1.3 (a) Rights to access information by a birth parent where the adopted child is under the age of 18

A birth parent of a person, under the age of 18, who was adopted on or after 1 January 2010 is entitled to receive information held by an Information Source only if the birth parent produces to the Information Source a Supply Authority issued by the Secretary of the Department of Family and Community Services authorising the disclosure of the information. Where a birth parent provides such a Supply Authority, the birth parent is entitled to receive the following information, subject to any conditions in the Supply Authority, held by an Information Source:

- Any non-identifying background information about an adopted person or his or her adoptive parents that will give the birth parent knowledge of the adopted child's life, and
- Birth details of the adopted person (including the time of birth and weight and length at birth).

If the birth parent does not have a Supply Authority, information can be released if the head of the Information Source, that is the Health Secretary or the Chief Executive Officer of the relevant Information Source, is of the opinion that the information cannot be used to identify the adopted person or their adopted parents.

3.1.3 (b) Rights to access information by a birth parent where the adopted child is over the age of 18

A birth parent of a person, over the age of 18, who was adopted on or after 1 January 2010 is entitled to receive any of the following information held by an Information Source:

- Any non-identifying background information about an adopted person or his or her adoptive parents that will give the birth parent knowledge of the adopted child's life, and
- Birth details of the adopted person (including the time of birth and weight and length at birth).

3.1.4 Non-adopted sibling's rights

A non-adopted sibling, of a person adopted on or after 1 January 2010, is able to access any non-identifying background information held by an Information Source about the adopted person or his or her adoptive parents and adoptive family that will give the non-adopted sibling knowledge of the adopted person's life. However, if the non-adopted sibling is under the age of 18, information can only be released with the written consent of the non-adopted sibling's parents or the Secretary of Family and Community Services.

3.2 Request to access information regarding adoptions occurring before 1 January 2010

If an adoption took place before 1 January 2010, an adopted person, their adopted parents and birth parents have rights to access information held by an Information Source, including the NSW Ministry of Health, a public hospital, a statutory health corporation or an affiliated health organisation.

3.2.1 Adopted person's rights

3.2.1 (a) Rights to access prescribed information by an adopted person who is over the age of 18

An adopted person who is over the age of 18, and was adopted before 1 January 2010, is entitled to receive information held by an Information Source only if the adopted person produces to the Information Source a Supply Authority issued by the Secretary of the Department of Family and Community Services authorising the disclosure of the information. Where the adopted person provides such a Supply Authority, the adopted person is entitled to receive the following information, subject to any conditions in the Supply Authority, held by an Information Source:

- Any relevant non-identifying information that is held by an Information Source about the physical and intellectual attributes, educational and vocational qualifications, social and cultural background, health and welfare, family and other relationships, religious beliefs, hobbies and interests of a birth parent, sibling, grandparent, aunt or uncle of the adopted person and that will give the adopted person knowledge of his or her origins, and
- Copies of medical reports of examinations of the adopted person made before the date of the adoption order.

3.2.1 (b) Rights to access prescribed information by an adopted person who is under the age of 18

An adopted person who is under the age of 18, and who was adopted before 1 January 2010, is entitled to receive information only with the consent of the person's adoptive parents or the Secretary of the Department of Family and Community Services.

If the adopted persons produce a written consent of their adoptive parents or the Secretary of the Department of Family and Community Services, the following information should be provided to the adopted person who is under the age of 18:

- Any relevant non-identifying information that is held by an Information Source about the physical and intellectual attributes, educational and vocational qualifications, social and cultural background, health and welfare, family and other relationships, religious beliefs, hobbies and interests of a birth parent, sibling, grandparent, aunt or uncle of the adopted person and that will give the adopted person knowledge of his or her origins, and
- Copies of medical reports of examinations of the adopted person made before the date of the adoption order

3.2.2 Adoptive parent's rights

An adoptive parent of a child, under the age of 18, who was adopted before 1 January 2010 is entitled to receive any relevant non-information that is held by an Information Source about the physical and intellectual attributes, educational and vocational qualifications, social and cultural background, health and welfare, family and other relationships, religious beliefs, hobbies and interests of a birth parent, sibling, grandparent, aunt or uncle of the adopted person and that will give the adoptive parent knowledge of the adopted person's origins.

3.2.3 Birth parent's rights

3.2.3 (a) Where the adopted person is over the age of 18

A birth parent of an adopted person over the age of 18 adopted before 1 January 2010, is only entitled to receive information about the adopted person if the birth parent produces a Supply Authority from the Secretary of the Department of Family and Community Services authorising the disclosure of relevant information. If the birth parent produces such a Supply Authority, the birth parent is entitled to receive the following information, subject to any conditions in the Supply Authority, held by an Information Source:

- Any relevant information that is held by an Information Source about the physical and intellectual attributes, educational and vocational qualifications, social and cultural background, health and welfare, family and other relationships, religious beliefs, hobbies and interests of an adopted person or his or her adoptive parent and that will give the birth parent knowledge of the adopted child's life after adoption
- Birth details (including the time of birth and weight and length of the person at birth), and
- Copies of medical reports and examinations of the adopted person made before the date of the adoption order.

3.2.3 (b) Where the adopted person is under the age of 18

A birth parent of an adopted person under the age of 18 is only entitled to receive information about the adopted person if the birth parent produces a Supply Authority from the Secretary of the Department of Family and Community Services authorising the disclosure of relevant information. If the birth parent produces such a Supply Authority, the birth parent is entitled to receive the following information, subject to any conditions in the Supply Authority, held by an Information Source:

- Birth details (including the time of birth and weight and length of the person at birth), and
- Copies of medical reports and examinations of the adopted person made before the date of the adoption order.

If the birth parent does not have a Supply Authority, information can be released if the head of the Information Source, such as the Chief Executive Officer of the relevant Information Source, is of the opinion that the information cannot be used to identify the adopted person or their adopted parents.

ELECTRONIC INFORMATION SECURITY (PD2020_046)

PD2020_046 rescinds PD2013_033

PURPOSE

All NSW Health Organisations must have appropriate systems and processes in place to adequately and appropriately protect their information systems and assets. This includes the fundamental responsibility to protect information from inappropriate, illegal or accidental misuse, modification, loss or release.

This policy applies to all users of NSW Health information systems and assets, including, but not limited to, employees, contractors, service providers and third parties, and all NSW Health information systems and assets, regardless of the media or location where information is stored, and the technology used to process the information.

SUMMARY OF POLICY REQUIREMENTS

All users of NSW Health information systems and assets have the responsibility to uphold confidentiality and protect information entrusted to them.

Information security measures and controls must be developed and implemented to ensure privacy of information is preserved, confidentiality of information is protected, integrity of information is maintained, and availability of information is assured.

NSW Health Organisations must identify and implement the appropriate scope of an Information Security Management System (ISMS) or Cyber Security Management System (CSMS) that is compliant with the relevant recognised standards.

A risk-based approach must be adopted to identify and prioritise information systems and assets security risks, ensure proper security measures are implemented and mitigate security risks to an acceptable level. These measures may be preventative, detective, responsive or recovery in nature.

A continual improvement process must be adopted to respond to, monitor, review and improve the effectiveness and efficiency of information security measures and controls in a changing environment.

NSW Health Organisations must ensure a consistent and effective approach to the management and where relevant, the escalation of information security incidents.

Electronic Information Security: Procedures

1. BACKGROUND

Any persons having access to NSW Health information have a responsibility to maintain the security and confidentiality of critical and sensitive information, including personal and health information.

NSW Health is committed to the provision of appropriate levels of security across all information systems and assets.

Confidentiality, Integrity and Availability are the security objectives that must be applied to NSW Health Organisations' information systems and assets. These objectives will uphold authorised restrictions on access to, and the use and disclosure of, information, to ensure data is protected against unauthorised alteration or destruction and to ensure authorised users are provided with timely and reliable access to information systems and assets.

NSW Health Organisations are required to assure the privacy of information systems and assets that include records containing personal and personal health information about employees and members of the public. This will uphold the individual's expectation and legal right that personal, health and any other identifying information will not be unlawfully disclosed.

Implementation of information security controls to mitigate the risks to sensitive information must be based on a risk management approach to ensure suitable and appropriate information protection.

All information must be classified in accordance with the NSW Government Information Classification, Labelling and Handling Guidelines. The guideline outlines how NSW Government agencies, such as NSW Health, must securely share, handle and protect information according to its sensitivity. Information which needs increased protection is to be either security classified and identified by a protective marking or assigned a Dissemination Limiting Marker (DLM). For NSW Health Organisations, information that has been classified and labelled using any of the six 'OFFICIAL: Sensitive' NSW DLMs or above, must be securely managed to ensure privacy and confidentiality is preserved. This includes the DLMs 'OFFICIAL: Sensitive – Health information' and 'OFFICIAL: Sensitive – Personal'.

The release of information must comply with NSW and Commonwealth legislation and relevant NSW Health policies.

1.1 About this document

This document establishes the provision of appropriate levels of security across all NSW Health Organisations' information systems and assets. It supports the governance of information security and dictates the principles to manage information security.

The security requirements in this document apply to all NSW Health information systems and assets regardless of the media storage location and the technology used to process the information. All security requirements are designed to be technology neutral. The requirements focus is on the fundamental objectives and measures to protect information.

1.2 Key definitions

Availability

Ensuring timely and reliable access to and use of information.

Confidentiality

Handling of information to ensure that it will not be disclosed in ways that are inconsistent with authorised use and its original purpose.

Cyber Security

Cyber Security is the prevention of damage to, unauthorised use of, exploitation of, and - if needed - the restoration of electronic information and communications systems, and the information they contain, in order to strengthen the confidentiality, integrity and availability of these systems.

Electronic information

Electronic information is information that is electronically created, processed, held, maintained and transmitted by NSW Health organisations. It also refers to information held electronically for or on behalf of other government agencies or private entities.

Information systems and assets

Refers to any information or communication infrastructure used by NSW Health Organisations and all personnel that work with it. This includes computer hardware and software, to create, process, hold, maintain or transmit electronic information.

Integrity

To protect information against unauthorised alteration or destruction and prevent successful challenges to its authenticity.

Personal health information

Personal health information is personal information or an opinion which concerns an individual's health, medical history or past or future medical treatment. It also includes other personal information collected in the course of providing a health service or information collected in relation to donation of human tissue.

Personal information

Personal information is information or an opinion (including information or an opinion forming part of a database and whether it is recorded in a material form) about an individual whose identity is apparent or can be reasonably ascertained from the information or opinion.

1.3 Legal and legislative framework

NSW Health Organisations that hold records containing either personal information or personal health information must meet the requirements of the:

1. *Health Records and Information Privacy Act 2002* (NSW); and
2. *Privacy and Personal Information Protection Act 1998* (NSW).

2. PROTECTION OF INFORMATION SYSTEMS AND ASSETS

To safeguard information systems and assets, NSW Health Organisations must have an Information Security Management System (ISMS) or Cyber Security Management System (CSMS) that is compliant with recognised standards and implement the relevant controls based on the organisation's requirements and risk tolerance.

Each organisation's security management system must include the following components:

1. Governance;
2. Risk Management;
3. Allocation of Resources and Training;
4. Evaluation; and
5. Continuous Improvement.

2.1 Governance

NSW Health organisations must have an executive-level governance committee accountable for the effective and efficient management of information security risks, associated plans and implementation of controls.

NSW Health organisations must implement security controls locally according to their needs.

2.2 Risk methodology

NSW Health organisations must use a structured approach to information security risk management, consistent with approaches for assessing and treating all types of risk, at all levels and for all activities within NSW Health.

Information security risk management involves identifying the types of risk exposure within NSW Health, measuring those potential risks and proposing means to mitigate them. While it is impossible to remove all risk, it is important to understand the risks and manage and identify the level of risk NSW Health Organisations are willing to accept in the overall context of effective operation and service provision.

2.2.1 Enterprise Risk Management Framework

NSW Health Organisations must assess and manage information security risks in line with the *NSW Health Enterprise-wide Risk Management Policy and Framework (PD2015_043).*

This framework provides a structure for a consistent risk management approach and for embedding risk management across all operations.

The risk management process includes the following steps:

1. Communication and Consultation;
2. Establish the context;
3. Risk Identification;
4. Risk Analysis;
5. Risk Evaluation;

6. Risk Treatment; and
7. Risk Monitoring, Review and Governance.

2.2.2 Risk assessment

Risk identification, analysis and evaluation are taken together and described as 'risk assessment'. Information security risk assessments are performed to allow NSW Health Organisations to assess, identify and modify their overall security. This process is required to obtain management's commitment to allocate resources and implement the appropriate security controls. All risk assessments must conform to the NSW Health Risk Matrix tool in terms of the relationship between likelihood and consequence.

2.2.3 NSW Health Risk matrix

The NSW Health Risk Matrix provides a tool to apply a severity rating to each risk, by assessing the potential consequence of the risk and its likelihood of occurring. The NSW Health Risk Matrix is required to be used for assessment and management of information security risks, development of risk registers and reporting of risks.

2.2.4 Risk treatment

Information security is a combination of preventive, detective, responsive and recovery security measures. Preventive measures avoid or deter the occurrence of an undesirable event. Detective measures identify the occurrence of an undesirable event. Responsive measures refer to coordinated actions to contain damage when an undesirable event (or incident) occurs. Recovery measures are for restoring the confidentiality, integrity and availability of information systems to their expected state.

Once the risks have been identified, analysed and evaluated; treatments are considered. Risk treatment involves selecting one or more options for addressing the identified information security risk(s) and implementing and managing those options. Risk treatment options include:

1. Risk Management / Reduction - The level of risk is to be reduced through the implementation of some or all recommendations made from the risk assessment. Appropriate and justified controls should be selected to meet the risk acceptance criteria as well as legal, regulatory and contractual requirements. When selecting controls, NSW Health Organisations must weigh up the cost of acquisition, implementation and maintenance of the control(s) against the 'value' of the information being protected;
2. Risk Transfer - This decision requires the risk to be transferred to another party that can effectively manage costs associated with the particular risk;
3. Risk Avoidance - Stop the activity that would give rise to the risk, thus eliminating the risk. Risk avoidance is not commonly selected as it typically results in not being able to exploit the associated opportunity; and
4. Risk Acceptance - This decision relies on the findings of the risk assessment and is applied when the level of risk is assessed within the business's defined risk tolerance level. However, the business may accept when it is not practical to avoid, treat or transfer the risk.

2.2.5 Selection and implementation of security measures

The appropriate security measures must be selected and implemented once security requirements have been identified. Security measures need to ensure risks are reduced to an acceptable level. The extent of the security measures required must be balanced against the potential business impact that may arise from security failures. Security measures can include local policies, standards, procedures, guidelines, practices, technological solutions and organisational structures. Measures will vary for different information systems and assets, depending on the criticality and sensitivity of the particular information asset.

2.2.6 Risk monitoring and review

Risks, threats and impacts will change over time and identified risks are to be reassessed to ensure the security measures selected remain appropriate and effective. Risks must be reviewed annually, or more frequently when major changes are made to information systems and assets.

2.3 Allocation of resources and training

Adequate resources (people, time, money) must be assigned to the operation of the ISMS/CSMS, including all security controls.

Information security training is required for all persons with access to NSW Health information to ensure procedures are followed to adequately protect information

2.4 Performance evaluation

NSW Health organisations must regularly collect and evaluate metrics on existing security measures: The evaluation of these metrics will lead to:

1. Improved information security processes – Quantify improvements in securing information and demonstrate quantifiable progress in information security objectives;
2. Increased accountability – By identifying specific security measures that are implemented incorrectly, not implemented or ineffective;
3. Greater support for decision making - Provide quantifiable information to the risk management process. Measure success/failure of investments and support resource allocation for future investments; and
4. Evidence of meeting requirements - Fulfilling ISMS/CSMS requirements and other applicable laws, rules and regulations.

2.5 Continual improvement

NSW Health Organisations must continually improve their ISMS/CSMS, including information security processes, techniques and controls. Continual improvement will be achieved through the ongoing processes of:

1. Risk assessment and treatment;
2. Evaluation of effectiveness of implemented security measures;
3. Corrective actions from internal audits and management reviews;
4. Reviewing and updating of information security documentation;
5. Training and awareness;
6. Review of information security incidents; and
7. Compliance reviews.

3. INFORMATION SECURITY INCIDENT RESPONSE PLAN

NSW Health Organisations must have an information security incident response plan that outlines the process for reporting and managing information security incidents, events and concerns from internal and external sources. Monitoring tools and processes must be in place for incident identification and response.

All users are responsible for reporting any information security concerns, events or incidents. Security events and incidents must be reported to eHealth NSW, Information Security Services within 48 hours and, to facilitate any investigation, as much relevant information as possible must be provided.

All reported information security concerns, events and incidents must be recorded in an appropriate register, which will be the official record and form the basis for evaluation and investigation. The register will be used to maintain the current status and the history of each incident as well as all decisions, recommendations and actions related to it.

The incident response plan must include the following steps:

1. Preparation;
2. Detection and Analysis;
3. Containment, Eradication, and Recovery; and
4. Post Incident Review.

3.1 Preparation

NSW Health Organisations must establish an information security incident response capability, separate to the security incident plan, so that they are ready to respond to incidents.

3.2 Detection and analysis

NSW Health Organisations must define the process for detecting and confirming an incident has occurred; categorising the nature of the incident and then prioritising the incident.

3.3 Containment, eradication, and recovery

NSW Health Organisations must identify the immediate response actions to deal with the information security incident. The primary objective is to confine any adverse impact to information systems and assets, followed by processes for the eradication of the threat and the return to the normal productive state of information systems and assets.

3.4 Post-Incident Review

NSW Health Organisations must compile a summary of actions and findings once the information security incident has been resolved. Any recommendations for changes to existing procedures or technology that will enhance the incident response plan must be documented.

4. ROLES AND RESPONSIBILITIES

Clearly defined roles and responsibilities ensure the proper protection of the information systems and assets of NSW Health.

4.1 Secretary, NSW Health

The Secretary, NSW Health must ensure all NSW Health Chief Executives establish, maintain and adequately resource an ISMS/CSMS. It is also the responsibility of the Secretary, NSW Health to ensure that the Chief Information Officer (CIO), NSW Health works with NSW Health Organisation Chief Executives and CIOs to implement this policy and that all NSW Health Organisations implement risk-based protections for information systems and assets.

The Secretary, NSW Health must ensure that all NSW Health Organisations comply with the NSW Cyber Security Policy. Reporting on compliance includes completing a yearly attestation report to be provided to Cyber Security NSW, which is completed by eHealth NSW on behalf of the Health Cluster. It is required that a copy of this report is included in the NSW Health annual report.

4.2 Chief Executives

Chief Executives must ensure that an ISMS/CSMS is established, adequate resources are allocated to implement the policy and associated framework, and there is appropriate resourcing and support of cyber security initiatives, including training and awareness and continual improvement initiatives.

It is also the responsibility of the Chief Executive, in collaboration with eHealth NSW, to ensure that their organisation complies with the *NSW Cyber Security Policy* and reports to the Secretary, NSW Health on compliance annually.

4.3 Chief Information Officer, NSW Health

The Chief Information Officer (CIO), NSW Health works with NSW Health Organisation Chief Executives and CIOs to implement this policy and ensures that all NSW Health Organisations implement risk-based protections for information systems and assets. This includes consideration of threats, risks and vulnerabilities that impact the protection of information systems and assets within their risk tolerance.

The CIO, NSW Health advises and guides NSW Health Organisation Chief Executives and CIOs on their responsibilities, which includes ensuring that all staff, including consultants, contractors, third parties and outsourced service providers, understand the cyber security requirements of their roles.

The CIO, NSW Health must also ensure a secure-by-design approach is in place for new initiatives and upgrades to existing systems and that all staff and providers understand their role in building and maintaining secure systems.

4.4 Director Information Security Services, eHealth NSW

The Director Information Security Services (ISS), eHealth NSW assists with defining and implementing risk-based protections for information systems and assets for NSW Health Organisations. Assistance and guidance is provided to NSW Health Organisations to implement policies, procedures, practices and tools that ensure compliance with this policy.

Responsibilities of the Director ISS, eHealth NSW include building an information security incident response plan that links NSW Health incident management and the whole of government cyber response plan. This allows the Director ISS, eHealth NSW to investigate, respond to and report on cyber security events within NSW Health and reports these incidents to the appropriate NSW Health governance forum and Cyber Security NSW.

The Director ISS, eHealth NSW must establish training and awareness programs to increase employees' cyber security capability and collaborate with NSW Health privacy, audit, information management and risk officers to protect NSW Health Organisation information systems and assets.

Other duties of the Director ISS, eHealth NSW include representing NSW Health Organisations on whole of government collaboration, advisory or steering groups, established by Cyber Security NSW as the central cluster Chief Information Security Officer (CISO) for NSW Health.

4.5 Data governance

The *NSW Health Data Governance Framework* outlines the roles and responsibilities involved in data governance and the structures in place to ensure effective and consistent management of the data assets of NSW Health.

The Framework facilitates data quality and comprehensiveness, appropriate access to data, information security, and standardisation of concepts.

Each data asset must have in place processes to protect the privacy and confidentiality of data through access management and security controls. This includes ensuring that the data is appropriately secured, backed up and disposed of according to agreed and documented protocols.

Data must only be disclosed for the purpose for which it is collected. Alignment of data and IT governance must enforce regulatory, architectural and security compliance requirements.

The Framework also provides the 'Principles of Data Governance for NSW Health' that support the structured and consistent management of data assets and outlines the essential components of data governance, including description of the roles of Data Sponsor, Data Custodian and Data Steward.

The Data Sponsor is responsible for the control of strategic direction and undertaking duties of ownership that includes:

1. Enabling strategic management, governance and operation of the asset;
2. Providing direction and guidance, and authorising appropriate resources for management of the data asset; and
3. Appointing a Data Custodian and ensuring the Data Custodian's duties are fulfilled.

The Data Custodian is responsible for the day to day management and oversight of the asset, approval of access to data and the overall quality and security of the asset. This includes:

1. Ensuring any use of the data aligns with the purpose for which it is collected;
2. Establishing a data quality framework that ensures the integrity, accuracy, completeness, timeliness, relevance, consistency and reliability of the data;
3. Controlling access to data in compliance with all relevant legislation, policies, standards and any conditions specified by the Data Sponsor;
4. Regularly reviewing users with access to data and the ongoing need and appropriateness of access; and
5. Appointing a Data Steward.

The Data Steward is responsible for the day to day management and operation of the data asset, its completeness and quality. This includes:

1. Managing the data asset in compliance with all relevant legislation, policies, standards and any conditions specified by the Data Sponsor;
2. Co-ordinating stakeholder engagement and input into the business requirements for the data asset; and
3. Providing advice to the Data Custodian and Data Sponsor on the management of the data asset.

4.6 System administrators

System administrators need to be aware of, understand and follow acceptable procedures for granting/revoking access, identifying and resolving known vulnerabilities, and monitoring system access. They are responsible for developing practices and procedures to support the policy and ensure compliance with the security requirements of information owners.

4.7 IT technical and support staff

IT support staff must manage confidentiality, integrity and availability of information systems. Staff are responsible for ensuring the appropriate access, delivery and ongoing support for systems, including applications, servers, networks, firewalls, routers and cloud services.

IT technical staff and system developers are responsible for delivering reliable software. Technical staff should understand the business use and risks associated with the technologies being used so that security solutions match the criticality and sensitive nature of the systems. They are responsible for developing practices and procedures to support the policy and ensure compliance with the security requirements of information owners.

4.8 Records and Information Managers

Records and Information Managers are responsible for maintaining a record and information management program in conformity with the standards and codes of best practice approved by NSW State Archives and Records. All disposal and destruction of records and information must be carried out in accordance with the relevant approved retention and disposal authority. They are responsible for developing practices and procedures to support organisation's records management policy and to ensure that records held in electronic (digital) or other technology dependent formats are accessible and protected for as long as they are required.

4.9 Users

Users of NSW Health information systems and assets play an important role in overall information security planning and risk management processes. Users must be aware of their responsibilities in relation to information security and privacy. Users have a role in identifying and reporting security concerns and incidents to management for investigation and review. Compliance with this policy and all relevant acts and regulations as they relate to information security is mandatory for all users.

4.10 Third party businesses and organisations, consumers and other agencies

The growing existence of inter-connected networks requires the extension of the 'boundaries' of NSW Health Organisations. All third parties must adhere to NSW Health and agency policies and procedures to ensure that adequate security controls are in place in the third-party environment.

4.11 Auditor

The role of independent reviewers and auditors is to assess the effectiveness and efficiency of implemented controls and whether controls are being adhered to. Independent reviewers and auditors must check compliance against policy and legislative requirements. Review and audit reports should be noted by executive management and, if appropriate, remedial action taken.

The internal auditor will regularly review NSW Health Organisations' adherence to this policy and cybersecurity controls, from a risk management perspective.

SUBPOENAS (PD2019_001)

PD2019_001 rescinds PD2010_065

PURPOSE

This Policy Directive outlines legislative provisions and procedures to be followed when the Ministry of Health and public health organisations are required to produce documents in response to a subpoena.

MANDATORY REQUIREMENTS

Each NSW Health Agency must have effective systems and procedures in place in order to make sure that subpoenas issued on the agency are complied with appropriately.

IMPLEMENTATION

Roles and Responsibilities

Chief Executives must ensure that:

- The principles and requirements of this policy and attached procedures are applied, achieved and sustained.
- All staff are made aware of their obligations in relation to this Policy Directive.
- Documented procedures are in place to support the Policy Directive.
- There are documented procedures in place to effectively respond to and investigate alleged breaches of this Policy Directive.

Hospital Managers and Staff have responsibility to

- Understand the legislative requirements of a Subpoena.
- Provide only the documents which are requested under the schedule of the subpoena.
- To be aware of whether any claim for privilege over the documents can be applied and take appropriate action.

CONTENTS

1 BACKGROUND

1.1 About this document

The Ministry of Health and public health organisations are often required to produce documents on subpoena and a proper officer or staff member may be required to attend court and give evidence. This Policy Directive reflects current legislation and outlines procedures to be followed to assist public health organisations to comply with subpoenas issued by both NSW and interstate courts.

1.2 Key definitions

Approved form in relation to a document, means the form approved under Section 17 of the *Civil Procedure Act 2005* for the purposes of that document.

Care Proceedings are Court proceedings where an application for a "care order" is made for the protection of a child or young person.

Court includes tribunal. For a detailed list of Courts, refer to Appendix C.

Defendant or **Respondent** is the person against whom the action is brought by the Plaintiff/Applicant.

Document means any record of information and includes

(a) anything on which there is writing;

(b) anything on which there are marks, figures, symbols or perforations having a meaning for persons qualified to interpret them; or

(c) anything from which sounds, images or writings are capable of being reproduced with or without the aid of anything else.

Health record is a documented account, whether in hard copy or electronic form, of a patient's health, illness and treatment during each visit or stay at a health service. This may include electronic correspondence regarding the patient's treatment and records (such as x-rays or a community mental health record) that are stored separately from the patient's medical record.

Note: Health record holds the same meaning as: 'health care record', 'medical record', 'clinical record', 'clinical notes', 'patient record', 'patient notes', 'patient file', and so on.

Issuing Party means the person who has caused the subpoena to be issued.

Legal Privilege Protects certain documents being disclosed in court proceedings. These documents are protected from release under subpoena due to a special statutory or legal relationship that applies to the information.

Patient Any person who receives a health service and to whom, as a result, a health practitioner owes a duty of care. Also includes clients of PHOs.

PHO under the *Health Services Act* 1997, a public health organisation is a Local Health District or a statutory health corporation (including Specialty Health Networks), or an affiliated health organisation in respect of its recognized establishments and services.

Proper Officer is a person within the organisation who will have access to the records pertained in the subpoena.

Plaintiff or **Applicant** is the person who has commenced the proceedings.

Record includes any document or other source of information compiled, recorded or stored in written form or on film, by electronic process or in any other manner or by any other means.

Return Date is the last day the documents must be produced to the Court.

Subpoenaed Party or **Addressee** means the person who is the subject of the order expressed in the subpoena. A subpoena can only be addressed to a person, which may be the proper officer of an organisation.

2 INTRODUCTION

2.1 What is a subpoena?

A subpoena is an order from a court requiring the Addressee to:

(i) Produce to a court a copy of the subpoena and documents or things as directed by the subpoena;

(ii) Attend a court to give evidence as directed by the subpoena; or

(iii) Do both,

"***A subpoena to attend and give evidence*** means that the person to whom the subpoena is addressed is required to attend court and give evidence.

A subpoena to produce means that the person to whom the subpoena is addressed is required to provide documents or things. Producing documents to the court can also be done on behalf of the organisation by their legal representative."

Documents or things include written, printed or electronic material that provide information such as reports, emails, letters, photographs, video or audio recordings, diagnostic images, medical images or reports, laboratory results, cameras, phones, other electronic devices, CDs, USBs and so on.

A subpoena can only be issued if legal proceedings have been commenced.

In some courts and tribunals subpoenas are called "summons to produce documents", "orders to produce documents" or "notices for non-party or third party production". In coronial matters subpoenas may be called "section 53 Directions". The general principles that apply to these documents are the same in NSW courts, the Federal Court and the Family Court due to the harmonising of the subpoena rules.

2.2 What to do when you receive a subpoena

A subpoena cannot be ignored and must be dealt with promptly. Failure to comply with a subpoena without lawful excuse is a contempt of court and can result in an arrest.

When a subpoena is received by a PHO, it should be brought to the attention of the appropriate branch and the appropriate person within the PHO. All PHO's should have designated officers to coordinate responses to subpoenas, for example a medico-legal officer or medical records officer.

For particularly sensitive matters, the designated officer should notify the Chief Executive Officer or an executive officer of the PHO about the subpoena.

For matters where a PHO, a unit or employee of the PHO is a party, the subpoena should be brought to the attention of the solicitors acting on behalf of the PHO as soon as possible, and certainly before any documents are forwarded to the court.

3 GENERAL INFORMATION ON SUBPOENAES

3.1 Who is the subpoena addressed to?

A subpoena must be addressed to a person, or to "The Proper Officer" if directed to an organisation. If a subpoena to produce is addressed, for example to the Proper Officer a particular hospital or community health service within a PHO, only records held by that hospital or community health service will need to be produced.

If a subpoena to produce is addressed to the Proper Officer of PHO (i.e. "X Local Health District"), relevant records from all facilities within the PHO will need to be produced. If the subpoena is addressed to the Proper Officer of a PHO requesting all records relating to a particular patient, there are two options that can be considered:

(a) Contacting the issuing party and ask the solicitor to nominate which facilities within the PHO they require records from. Ask for this to be confirmed in writing.

(b) Search all facilities within the PHO for records relating to the patient. If this needs to be done, a separate fee may be charged for each facility searched. The issuing party should be told that fees will be payable for each facility searched. It is not necessary for the issuing party to issue separate subpoenas each addressed to separate facilities within the PHO.

3.2 Is the subpoena in the approved court form?

A subpoena must also be in the approved court form. If a subpoena is defective in this regard, the PHO should promptly inform the issuing party in writing and return any conduct money provided. The letter should explain how the subpoena is defective and be copied to the Clerk or Registrar of the court. A list of approved court forms can be found at www.ucprforms.justice.nsw.gov.au.

3.3 What if the PHO is a party to the proceedings?

If the subpoena lists the PHO or unit of the PHO as a party to the proceedings (for example as the Defendant), the subpoena should be referred to the appropriate person who will then forward it to the solicitor who has been instructed to act for the PHO (or unit) in those proceedings. If no solicitor has been appointed to represent the PHO (or unit) in the proceedings, the executive officer (or delegate) of the PHO (or unit) should be notified so that a solicitor can be appointed.
If a solicitor has been appointed, that solicitor should be instructed to respond to the subpoena. If the PHO decides not to engage a solicitor, the subpoena should be processed in the normal way set out in Part 33 of the UCPR.

3.4 What if the subpoena relates to a coronial inquest?

A subpoena to produce issued by the Coroner's Court needs to be signed by the Coroner or Assistant Coroner issuing it and provide a date and place where the document is to be produced. The Coroner may serve a subpoena by way of facsimile and is not required to provide conduct money.

The subpoena should be referred to the solicitor who has been instructed to represent the PHO's interests at the inquest, or in relation to the investigation to respond to the subpoena. If no solicitor has been appointed, the relevant medical administrator should review the medical records of the deceased and an assessment should be made as to whether the executive officer (or delegate) of the PHO should be notified so that consideration can be given to instructing a solicitor to represent the PHO. It may be appropriate for the relevant medical administrator to also consider notifying the PHO risk manager and the Treasury Managed Fund of the incident, if they have not already been notified.

If the PHO decides not to engage a solicitor, the subpoena should be processed in the normal way.

3.5 Has the subpoena been validly issued?

In most matters, subpoenas must be issued by a court or a tribunal. This means that they should include a court stamp or signature of a court officer.
If a party to the proceedings is represented by a solicitor, a subpoena may be filed electronically with the court except for some Local Court proceedings. If a subpoena is filed electronically, there will be an electronic court stamp. They are still valid subpoenas and should be complied with.
In some Local Court proceedings, Police Officers and Public Officers, rather than the Local Court can

issue subpoenas. These subpoenas do not need to be stamped. For more detail on these types of subpoenas, see Section 3.10.

In criminal, AVO and some civil proceedings, if the subpoena is seeking "counselling communications" for a victim of sexual assault, then the subpoena can only be issued with the leave or permission of the Court. Look for an attached court order or letter from the lawyer who issued the subpoena stating that leave was granted on a particular date. A subpoena issued without such leave will be invalid. For further information, see Appendix A – Sexual Assault Communications Privilege.

3.6 If you are uncertain about whether a subpoena has been validly issued, contact the court in which the proceedings have been commenced and ask for confirmation. What are the proceedings about?

From reading the subpoena you will be able to ascertain whether it is a civil or criminal matter and the identities of the parties. This information is contained within the Subpoena. Matters in the Family Court or Federal Circuit Court may involve children of the named parties.

In criminal matters, one of the parties will usually be the Director of Public Prosecutions, ("DPP"), or 'Regina' or 'R'. It is also possible (but less common) that one of the parties in a criminal matter will be a government department with the power to prosecute offences, such as the Australian Taxation Office or the Environmental Protection Agency.

As well as looking at the names of the parties, subpoenas should state what court, and sometimes what division of the court the matter is to be heard in, which might help ascertain what the proceedings are about. For a description of common courts, see Appendix C.

The Addressee of a subpoena to produce may request a copy of the appropriate Statement of Claim to assist them with determining the relevant documentation so that they are able to comply with the subpoena.

For more information on relevance, or legitimate forensic purpose, see Section 6.2.

3.7 Has the subpoena been properly served and in time?

The subpoena must be personally served on the person to whom it is directed, unless the subpoenaed party agrees to accept service by other means such as by post.

A subpoena to attend and give evidence must specify the date, time and place for attendance.
A subpoena to produce should be served in sufficient time to allow the collection of documents and delivery to court. The subpoena will say on it that you need not comply with it if it is served after the due date. The due date will not be less than five working days prior to the return date (ie. the date that the documents are required by the court) unless the court that issued the subpoena has shortened the time for serving it. If the court has made an order to shorten the period in which you must comply, the subpoena will be marked accordingly.

NB: The Federal Circuit Court requires the issuing party to serve the subpoena at least 10 clear working days before the date for producing documents, and 7 clear working days before giving of evidence. The Family Court is 7 clear working days for both giving of evidence and production of documents.

If the subpoena is served after the due date and there is no note or endorsement on the subpoena from the court stating that the time for service has been shortened, then the subpoena need not be complied with by the due date however you should contact the issuing party and ask that they obtain a further return date (an adjournment) so as to allow sufficient time for the documents to be collated.

Even where a subpoena to produce has been served in time, it may be possible to negotiate an extension of time within which to produce the documents with the issuing party. If the PHO has solicitors acting

on its behalf in the matter, those solicitors may be able to negotiate an extension of time on behalf of the PHO. If the PHO has not engaged solicitors, the person responsible for responding to the subpoena can contact the issuing party to negotiate an extension of time directly.

3.8 Does it make any difference if the subpoena is a facsimile, photocopy or a scanned copy?

As a general rule the original subpoena should be served to ensure it is authentic. Upon receipt of a facsimile, photocopy or scanned copy the issuing party should be contacted. All reasonable steps should be taken to ensure that an authentic subpoena is served. This will protect the PHO from claims by patients that their privacy and confidentiality have been breached by the production of the documents without an authentic subpoena.

However, this must be balanced against the requirements of the *Uniform Civil Procedure Rules* ("UCPR") which applies to all NSW Courts, the NSW Industrial Relations Commission and the Dust Diseases Tribunal only. The UCPR states that despite the requirement that a subpoena must be served personally on the subpoenaed party, the subpoenaed party must comply with the requirements of a subpoena even if it has not been served personally, even if the subpoenaed party has by the last date of service for the subpoena, actual knowledge of the subpoena and its requirements.

In some instances the Court may give approval to a party to serve a subpoena via electronic means, such as email.

Finally, the NSW Coroner's Court can serve a subpoena by way of facsimile (Section 105 *Coroner's Act 2009*).

3.9 What is the date the subpoena must be complied with?

Where a PHO has been ordered to produce documents, a 'return date' should be listed on the subpoena. If electing to send the documents or things via mail they should be received at the Court Registry at least 2 clear working (business) days before the date specified in the subpoena for production.

As noted in paragraph 3.6 above, it may be possible to negotiate an extension of time within which to produce the documents with the solicitor or person who issued the subpoena. This should be done prior to the original return date.

A failure to comply with a subpoena is a serious matter. The return date of each subpoena served on the PHO should be carefully noted as soon as it is received.

3.10 How can documents be produced to the court?

The subpoena allows the PHO to produce documents by attending the Court at the date, time and place specified and produce the subpoena or a copy of it and the documents or things to the court. Alternatively the PHO may deliver or send the subpoena and the documents or things requested in the schedule of the subpoena, via a courier or registered mail to the Registry at the address specified in the subpoena. As noted in paragraph 3.8 above, if documents are being posted, they should be received by the Court Registry at least 2 clear working days before the date specified in the subpoena to produce.

3.10.1 Providing documents electronically to Courts and Tribunals

Some Courts and Tribunals now accept subpoenaed material in an electronic format, such as on a DVD, CD or a USB device.
Sending information that is classified as 'sensitive' to destinations external to NSW Health, such as Courts and Tribunals, should be encrypted using approved encryption technologies or passwords in accordance with relevant regulations and Privacy Manual for Health Information.

Supreme Court of NSW

The Supreme Court of NSW accepts material in electronic formats. If the subpoena or covering letter from the issuing party does not specify that electronic formats are acceptable, you should contact the issuing party and see if they are agreeable to this. Documents should be provided as a PDF file. Electronic subpoena documents can be emailed to the Registry at supremecourt.enquiries@courts.nsw.gov.au. The subject line of the email should state "Producing subpoena documents" and include the case name and number. A scanned copy of the subpoena should also be attached.

District Court

Subpoenaed material may be provided in any electronic form that the issuing party has indicated will be acceptable. If the issuing party does not specify that electronic formats are acceptable and you would like to provide the material electronically, you should contact the issuing party and see if they are agreeable to this.

Tribunals

The NSW Civil and Administrative Tribunal and Administrative Appeals Tribunal generally do not accept subpoenaed material electronically, and require hardcopies to be produced to the Registry.

Local Court Criminal Matter

Police Officers and a Prosecutor who is a Public Officer have the power to issue subpoenas in the following types of Local Court proceedings:

- Local Court criminal summary and committal hearings;
- Local Court Application Notice proceedings;
- Children's Court criminal proceedings; and
- Apprehended Violence Proceedings.

Under the *Criminal Procedure Act*, ***prosecutor*** means the Director of Public Prosecutions or other person who institutes or is responsible for the conduct of a prosecution and includes (where the subject-matter or context allows or requires) an Australian legal practitioner representing the prosecutor.

Public Officer is defined as any of the following persons, if acting in an official capacity:

(a) an employee in the Public Service or the NSW Police Force;
(b) an officer or employee of a statutory body representing the Crown;
(c) an employee of a council within the meaning of the *Local Government Act 1993*;
(d) a member of staff of Local Land Services; or
(e) the Director of Public Prosecutions, Deputy Director of Public Prosecutions or Solicitor for Public Prosecutions.

Subpoenas issued by police officers or a Prosecutor who is a public officer will not have been signed and dated by a registrar of the Local Court. They will not have a court stamp. They are still valid subpoenas and should be complied with.

Children's Court

Any party to care proceedings in the Children's Court may seek leave to issue subpoenas in the proceedings. Subpoenas issued in care proceedings are issued by the Children's Court, Children's Magistrate or Registrar pursuant to Section 109C the *Children and Young Persons (Care and Protection) Act 1998*, and will therefore always be stamped with the seal of the Children's Court and/or signed and dated by the Children's Magistrate or Registrar.

A subpoena issued in care proceedings must be served on the recipient no less than five clear working days, or any such other date specified in the subpoena as endorsed by the Children's Magistrate or Registrar, before the return date. The issuing party is also required by s 108E of the *Children and Young Persons (Care and Protection) Act 1998* to tender conduct money at the time of service for the reasonable expenses of the person in complying with the subpoena.

3.11 What if an interstate court issued the subpoena?

It is common for some hospitals in NSW to receive subpoenas issued by interstate courts. For example, hospitals in northern NSW often receive subpoenas (known as notices of non-party disclosure) issued by courts in Queensland.
The Commonwealth *Service and Execution of Process Act* allows for interstate subpoenas to be validly served in NSW if they are accompanied by notice. The general rule is that subpoenas served interstate should be served 14 days prior to the return date. This time can be shortened by the court that issued the subpoena if a shorter time period is necessary in the interests of justice and there will be enough time for the subpoenaed party to comply without serious hardship or inconvenience. There may however be circumstances where further time is needed to produce the material of the subpoena. In such circumstances, it is generally best for the recipient of a subpoena to contact the party issuing the subpoena.
PHO's are entitled to request that the original subpoena (or a copy of the original) is served, rather than a faxed copy.

4 CONDUCT MONEY AND/OR COSTS OF COMPLIANCE

4.1 What is conduct money?

When a subpoena to give evidence is served on a person or a Proper Officer of an organisation, the person named is not required to attend and give evidence under the subpoena unless conduct money has been paid. This means an amount sufficient to meet the 'reasonable expenses' of attending (which are often prescribed). Conduct money must be provided at the time the subpoena to attend and give evidence is served.

In relation to subpoenas to produce, the Addressee is able to claim the 'reasonable expenses' of complying with the subpoena.

The court in the event of a dispute will determine what is 'reasonable' conduct money or costs of compliance. In reaching a decision the court is likely to take into account NSW Health policy when determining what is reasonable.

The rates to be applied for servicing a subpoena for production are advised annually by NSW Health in an information bulletin titled *Health Records and Medical/Clinical Reports – Rates* and the Policy Directive titled *Health Records and Medical/Clinical Reports – Charging Policy.*
Even if original documents are being produced to court, the photocopying charge will still apply. It will cover the cost of copying the records so that the PHO can maintain a copy whilst the originals are removed.

If a subpoena asks for records relating to more than one patient, the PHO has the discretion to charge separate fees for each patient.

If a subpoena requires searches for records to be undertaken at more than one facility of the PHO, the PHO has the discretion to charge separate fees for each facility searched.
Conduct money does not need to be paid in the following circumstances:
- NSW Civil and Administrative Tribunal
- NSW Coroner's Court
- Local Court proceedings where a Police Officer or Public Officer have issued the subpoena (as discussed in section 3.10)

4.2 What if the conduct money is inadequate?

If the record is lengthy, or will require a number of files to be searched or otherwise take up staff time so that it will cost more than the amount provided to produce the record, the issuing party should be contacted and advised of the estimated cost of compliance including staff time in searching and locating the relevant records, photocopy costs and mail or courier fees. Such contact may be by telephone but should be confirmed in writing.

In the event that the actual costs exceed the estimate, a further account should be raised against the issuing party. Information Bulletin 2017_035 is a useful guide that is updated each year to assist in determining costs of compliance.

If compliance with a subpoena involves a significant amount of work, consideration should be given to discussing with the issuing party whether they are prepared to narrow the scope of the subpoena (see Section 6.1 of this Policy Directive).

If the conduct money and/or amount paid for production expenses is inadequate, the PHO representative should:

(i) Call the issuing party to inform him or her of your requirements.

(ii) If there is still a refusal to provide additional conduct money or production expenses, or you consider it insufficient, contact the issuing party and attempt to negotiate some compromise on the amount.

(iii) In the event that conduct money was not provided by the issuing party and / or the amount of conduct money or amount paid for production expenses is considered to be 'unreasonable' the PHO or solicitor acting on behalf of the PHO should advise the Court on the day the documents are produced to the Court and request the Court make an order to the issuing party that they pay conduct money and/or the amount of any reasonable loss or expense incurred in complying with the subpoena.

4.3 What if too much conduct money has been provided?

The PHO is entitled to retain the minimum amount of conduct money and/or production expenses.

If more than the minimum amount is provided and the cost of producing the records is less than the amount provided, the records should be copied and delivered to the court and the excess amount should be refunded to the issuing party.

4.4 Can the PHO keep the conduct money if it has no documents to produce?

If the PHO receives a subpoena, conducts searches for the records requested, and has no records to produce, it may retain a reasonable amount to cover the cost of conducting the searches, and the cost of writing to the Court explaining that it has no records to produce.

If the records have been lost, misplaced or destroyed, then the court should be advised that there are no records to be produced and the amount paid should be refunded.

5 WHAT DOCUMENTS HAVE BEEN REQUESTED IN THE SUBPOENA TO PRODUCE

5.1 How do I determine the scope of the subpoena?

The schedule to the subpoena must be read very carefully to determine the scope and document required. This is critical because the PHO is under an obligation to produce only those documents covered by the description set out in the subpoena. A subpoena may call for the production of health and/or non-health related records. The applicable procedures are the same.

The next task is to undertake appropriate inquiries to determine whether the PHO is in possession of any records which fall within the scope of the subpoena, the likely location of the records and the number of files that may have to be searched.

The PHO should take care only to copy and produce documents that are within the scope of the subpoena. Do not provide any documents that are outside of the scope of the subpoena.

Documents that do not come within the scope of the subpoena should be removed from the medical record before it is copied and documents are sent to court. This may also mean redacting portions of documents if there is extraneous, irrelevant or privileged information contained within a document to be released. A clear record of which documents have and have not been produced and a copy of the subpoena should be kept by the PHO. This may involve keeping an additional copy of the records that were sent to the Court, if the records that were sent are a small extract from the medical record.

The schedule will generally address one patient, who is mostly a party to the proceedings. Care needs to be taken to protect the information of those parties who are not represented in the proceedings and would not anticipate their personal information being released to a Court without their knowledge.

Sometimes there may be letters from specialists, who state that the letter should not be released to a third party without the consent of the author, contained within the clinical record of a patient whose records have been subpoenaed. If the letters are included in the clinical record which has been requested in the schedule of the subpoena, the documents must be sent to Court. There is no need to obtain the permission of the specialist although the PHO should consider contacting the specialist as an interested party before producing those documents.
Only material specifically referred to in the schedule to the subpoena should be collated.

Examples

Scenario: A patient, Sara X, attends Chester Public Hospital on 28/9/2000 after being sexually assaulted. There are several later attendances to the hospital over the next three months. Some of these admissions being for surgical procedures unrelated to the sexual assault.

On 30/9/2000 Sara also visits the Chesterfield Sexual Assault Service, (a separate facility of the Chester Local Health District, located in Main St, Chester) in relation to the sexual assault, and there are several sessions with a sexual assault counsellor Jenny K, after this initial presentation.

Some months later, the defence in a criminal trial decide to issue a subpoena to the Chester Local Health District seeking access to documents held on Sara X. Some of the requests they consider putting in the subpoena include:

"All notes relating to the visit by Sara X to the Chester Hospital on 28/7/2000"

The Hospital holds no records relating to an admission of Sara X on 28/7/2000. The hospital is not required to, nor should it volunteer any information in relation to other visits Sara X may have made to the Hospital.

"All notes of the visit by Sara X to the Chester Hospital on 28/9/2000"

The only records caught by the subpoena are the actual notes which relate to the visit on 28/9/2000. No reference is made to other visits Sara X made to the Hospital, or the Community Health Centre at later dates, so these documents are not caught by the subpoena.

"All notes relating to the visit by Sara X to the Chester Hospital on 28/9/2000 or any time thereafter"

All notes included on Hospital records are captured, including notes on the unrelated surgical procedures. The subpoena does not, however, capture any records generated by the Sexual Assault Service which are not in the possession of or under the control of the Hospital. The Sexual Assault Service is a separate facility of the Local Health District, and is located outside the hospital campus. As such, the LHD is not required to, nor should it volunteer any information on visits made by Sara X to the Chesterfield Sexual Assault Service. Had the Sexual Assault Service been located within the hospital campus, and its records been in the possession of or under the control of the Hospital (and related to a visit to the Hospital), the result in this case would have been different.

"All notes and counselling records prepared by counsellor Mary G in relation to any counselling sessions conducted with Sara X."

The subpoena does not identify the records of a particular facility. As such, and as the subpoena is addressed directly to the Local Health District, all LHD records should be checked, including those held by the SAS. Note, however, that the subpoena names a specific counsellor, and only requests her notes. Mary G did not see Sara X, so the LHD does not hold any records covered by the subpoena. The LHD is not obliged to inform the court that another counsellor saw Sara X.

"Any records, notes reports or any other written material held by any facility of the Chesterfield Local Health District, including but not limited to the facilities at the Chester Hospital and the Chesterfield Sexual Assault Service relating to Sara X and dealing with an alleged sexual assault on 28/9/2000.

This is a more usual approach. The terms of the subpoena are broad, and clearly captures all the relevant documents held by the LHD on Sara X. The only documents not captured would be those dealing with the unrelated surgical procedures. Note however, the reference to "Chesterfield Local Health District", when the actual legal entity is the "Chester Local Health District". If the subpoena also wrongly names the LHD, arguments could be raised against complying with it.

5.2 What documents need to be produced?

This will depend on the scope of the subpoena to produce. It is important to read the schedule of the subpoena carefully in order to determine what documents are being requested. If this is not clear, contact the solicitor issuing the subpoena.
If the subpoena requests "*any records*" or "*all records*", this means the entire file relating to the patient, including correspondence and x-rays, including when the documents are stored separately to the medical record. For example, a patient's community mental health record, clinical record of sleep studies record would also need to be produced should a PHO receive a subpoena requesting all records within the PHO relating to that patient.
The definition of 'document' captures any electronically held documents and hard copy documents. Electronically held documents are those held, for example, in an electronic medical record, other clinical information systems or information contacted on a computer file, such as photos and / or videos. This would also include emails exchanged by clinicians regarding the particular patient along with any clinical records/reports from other PHO's or referring doctors.
With the continuing expansion of information technology systems across NSW Health, PHO's should keep in mind that a patient's health information may be stored on an electronic database that is an

extension of the patient's health record, for example the HealtheNet Clinical Portal. Depending on the scope of the schedule to the subpoena issued to a PHO, records from state-wide databases or databases that are in the possession of or under control of a particular PHO may need to be collated and produced if they form part of the patient's record at the PHO (whether they have been accessed by clinicians or not).

5.3 What if the subpoena captures reports to Family and Community Services?

Under Section 29 of the *Children and Young Persons (Care and Protection) Act 1998*, risk of harm reports made to the Secretary, Department of Family and Community Services are not produced in response to a subpoena, summons or notice to produce other than:

(i) Care proceedings in the Children's Court;

(ii) Proceedings in relation to a child or young person under the *Family Law Act 1975* (Cth);

(iii) Proceedings in relation to a child or young person before the Supreme Court or Civil and Administrative Tribunal;

(iv) Proceedings before the Civil and Administrative Tribunal that are allocated to the Guardianship Division of the Tribunal or are commenced under the *Victims' Rights and Support Act 2013*;

(v) Proceedings under the *Coroners Act 2009*.

Section 27A(7) of the *Children and Young Persons (Care and Protection) Act 1998* provides that a referral by a mandatory reporter to their relevant Child Wellbeing Unit is also protected from production under Section 29 of the Act.

Although risk of harm reports, or documents evidencing the contents of a risk of harm report, may be produced in response to subpoena, summons or notice to produce issued in certain proceedings, Section 29(f) of the *Children and Young Persons (Care and Protection) Act 1998* prohibits the disclosure of the identity of a person who made a report, except with:

(i) The consent of the person who made the report, or

(ii) With leave of the Commissioner.

Section 29AA of the *Children and Young Persons (Care and Protection) Act 1998* similarly prohibits the disclosure of the identity of a person who made a report to a Royal Commission, except in the circumstances described above.

It is possible for a court or other body before which proceedings relating to the report are conducted to grant leave to a party or a witness to disclose the identity of the mandatory reporter if the court or other body is satisfied that the evidence is of critical importance in the proceedings and that failure to admit the evidence would prejudice the proper administration of justice. If a court or other body grants leave for this to occur reasons must be provided as to why leave is granted, and the court or body must ensure that the holder of the report is informed that evidence as to the identity of the person who made the report, or from which the identity of that person could be deduced, has been disclosed.

5.4 What if the subpoena captures sensitive records?

For medical records, the prime criterion of sensitivity is whether the patient would consider the data sensitive. Records relating to people or patients who are not directly involved in the legal proceedings can also be classified as sensitive. Examples include where genetic counselling or medical records contain information relating to persons other than the patient.
The fact that records are sensitive does not itself mean that privilege can be claimed over them, or that they do not need to be produced. If a subpoena requests sensitive records and there are no grounds for challenging the subpoena or claiming privilege (see Section 6), the procedure set out in Section 7.4 may be followed.

5.5 What if there are no documents or information?

If there are no documents or information, a letter should be written to the court advising the court that there are no documents or information to be produced. This letter should be copied to the issuing party. The conduct money may be retained.

However, if there are no records but there is evidence that there once were relevant records that have been lost, misplaced or destroyed, then the court should be advised that there are no records to be produced and the conduct money should be refunded.

A file note should be created outlining efforts made to find the relevant records.

If records were destroyed in accordance with a disposal authority approved under Section 24 of the *State Records Act 1998*, a copy of the disposal authorisation should be included and the relevant disposal category cited. Disposal authorisation is the consent of public office that is required before records can be disposed of.

6 SUBPOENA TO PRODUCE – GROUNDS TO OBJECT OR SET ASIDE

In most instances, when a subpoena to produce is issued, the issuing party must also serve a copy of the subpoena on all active parties to the proceeding as soon as practicable after the subpoena has been served on the Addressee.

The court may, on the application of a party to the proceedings, or the Addressee, or any person having a sufficient interest, set aside a subpoena in whole or in part. If any party or person files a motion to set aside a subpoena issued to a PHO, the PHO must be notified.

If a subpoena issued to the PHO is set aside, the PHO is no longer required to comply with the subpoena.

The information provided below applies when the PHO itself seeks to set aside a subpoena or object to access to documents required to be produced under subpoena.

6.1 The subpoena is too wide and/or oppressive

A subpoena to produce may be set aside:

- where its terms are so wide and/or insufficiently precise that compliance (i.e. collation and production of documents) would impose an onerous obligation on the PHO; or
- where a subpoena is used for the purpose of "fishing" for information which a party hopes, but does not reasonably expect is in existence. This may apply particularly to broad requests for protocols and investigation documents.

Subpoenas which request the production of medical records relating to persons who are not parties to the proceedings, or which request records relating to multiple, unrelated patients may be an abuse of process or oppressive.
The subpoena may also be oppressive if it is not clear what documents are sought by a subpoena, or if it appears that the documents sought will have little or no relevance to issues in the proceedings. The scope of a subpoena can be narrowed in two ways:

(i) by agreement with the issuing party; and

(ii) by successfully challenging the subpoena in court (see Section 8 of this Policy Directive).

If you believe that the scope of the subpoena is too broad and calls for documents to be produced which are demonstrably not relevant to the proceedings, an option available is to approach the issuing party with a view to seeking a compromise on the range of documents that are required. If a compromise is reached, written confirmation should be obtained from the issuing party as to the terms of the amended schedule to the subpoena.

If the issuing party refuses to negotiate the scope of the subpoena as is suggested above and you still wish to set aside a subpoena on the basis that it is an abuse of process or oppressive, you should consult your immediate manager, who may need to consult the PHO Executive, and obtain advice from the PHO's solicitors if appropriate.
You should be aware that where a subpoena is challenged unsuccessfully, the PHO may be liable to pay the court costs (associated with argument over the subpoena) of the issuing party.

6.2 The subpoena is an abuse of process or lacks a legitimate forensic purpose

A subpoena to produce that has been issued for reasons other than for the purpose of obtaining relevant evidence for the proceedings may be set aside.

In criminal matters, an accused person must have an objective basis for demonstrating a real possibility that the subpoenaed material would assist his or her defence. Only documents that have a legitimate forensic purpose need to be produced. Legal advice is recommended in order to argue that records have no legitimate forensic purpose.

6.3 Public interest immunity

Where the public interest that would be served by withholding certain documents is so strong that it overrides the public interest in the following of due process, a subpoena may be set aside. A challenge on this basis applies only to very limited types of documents and will usually only be available to documents which may affect national security, the workings of the NSW Cabinet or some other extraordinary public interest.

NB: If you wish to challenge a subpoena on a public interest immunity basis, you should contact the Legal Branch on telephone (02) 9391 9606.

6.4 Client legal privilege

Client legal privilege can protect certain documents from being disclosed in court proceedings. This privilege applies to confidential communications between a client and another person, or between a lawyer acting for the client and another person, if the communication was for the dominant purpose of the client being provided with professional legal services relating to a court proceedings or an anticipated or pending court proceedings in which the client is or may be, or was or might have been, a party.
If a claim for legal professional privilege is contested, evidence will be required from the author of the documents and/or the person who requested that the document be created, that it meets this test; and/ or other investigations will need to be undertaken as to the document's dominant purpose.

If a PHO wishes to claim client legal privilege over documents it has created for legal proceedings, the lawyer that the PHO instructs in those proceedings will be responsible for claiming the privilege.

6.5 Qualified privilege

NSW qualified privilege legislation (Division 6B of the *Health Administration Act 1982*) applies to approved quality assurance committees. Qualified privilege operates to prevent committee members and documents produced by the committee from being used in any legal proceedings.
Qualified privilege applies to records that are under the control of an approved quality assurance committee, or a member of an approved quality assurance committee and were created at the request of or solely for the purpose of the committee. If documents were created by an approved quality assurance committee but have been disclosed to other units of the PHO, the privilege may be waived, however, if the committee has not waived privilege over the documents and a subpoena is received for these records, the PHO should write to the party who issued the subpoena and to the court stating that the records are protected by qualified privilege legislation and will not be produced.

If records relating to quality assurance activities and morbidity and mortality case reviews or committees are requested, the PHO Executive should be contacted to confirm whether the records are records created by an approved quality assurance committee.
In addition to approved quality assurance committees, the Minister has approved the following committees under Section 23 of *Health Administration Act 1982*, to be specially approved committees;

- Special Committee Investigating Deaths Under Anesthesia,
- Collaborating Hospitals Audit of Surgical Mortality Committee,
- NSW Maternal and Perinatal Mortality Review Committee,
- Mental Health Sentinel Events Review Committee, and
- Clinical Risk Action Group Committee.

These committees do not need to comply with subpoenas. If one of these committees is subpoenaed, it should not comply with the subpoena unless it has the approval of the Minister to do so, or the consent of the person from whom the information was obtained. A letter should be sent to the solicitor issuing the subpoena, as well as the Court, explaining the committee's special status and stating that records will not be produced

6.6 Sexual Assault Communications Privilege

Records relating to the counselling of victims of sexual assault (protected confidences) may be protected from production if they are covered by sexual assault communications privilege. Sexual assault communications privilege can be claimed in criminal proceedings, including proceedings relating to Apprehended Violence Orders (AVOs) in NSW Courts. The sexual assault communications privilege may also be claimed in NSW Courts in civil proceedings, in limited circumstances, when the privilege was granted in criminal proceedings. The privilege may also be claimed in federal courts, such as the Family Court or Federal Circuit Court, if exercising jurisdiction in NSW and in the courts of other States and Territories of Australia.
PHOs have an obligation to their patients to take steps to protect confidential sexual assault counselling communications from being disclosed where disclosure would harm the patient.

See **Appendix A** for further detail about the privilege.

6.7 Professional Confidential Relationship Privilege

This privilege may apply to a communication made by a person, in confidence, to another person in the course of a relationship in which the confidant was acting in a professional capacity and where the confidant was under an express or implied obligation not to disclose the contents of the communication. The privilege can be claimed in NSW courts. The privilege may also be claimed in federal courts, such as the Family Court or Federal Circuit Court, if exercising jurisdiction in NSW and in the courts of other States and Territories of Australia.

A protected confidence may include a communication between a health professional and a patient. The definition potentially covers many aspects of clinical records.

See **Appendix B** for further detail about the privilege.

7 COURT PROCEDURE FOR CHALLENGING ACCESS TO DOCUMENTS PRODUCED UNDER SUBPOENA

7.1 Subpoenas for records where the Addressee objects to inspection on grounds that they are privileged (other than sexual assault and confidential communications privilege)

A solicitor's assistance will be necessary depending on the complexity of the case. Discussion should be undertaken with the appropriate PHO Unit (e.g. CGU) to ensure that a solicitor is consulted or appointed if necessary.

If a PHO decides to challenge access to documents produced under subpoena without legal representation the following procedures will apply:

(i) Follow 7.1 – should I notify anyone of the subpoena?

(ii) Follow 7.3 – procedure for delivering subpoenaed documents to the court?

(iii) Place the records which are to be produced in a sealed envelope.

(iv) Place any records over which a claim for privilege will be made in a separate envelope and mark the word "privileged" on the envelope.

(v) Attach a copy of the subpoena to the outside of each envelope.

(vi) Place the envelope(s) marked "privileged" inside another envelope and send to the court with a letter to the Registrar notifying the court that the Addressee objects to the documents or things being inspected by any party to the proceedings and setting out :

(a) What type of privilege is claimed; and
(b) The reasons supporting the claim for privilege.

(vii) Consider attending in person on the return date, or instructing the PHO's solicitor to attend, in order to argue in support of the claim for privilege.

NB: For matters in NSW Civil and Administrative Tribunal (NCAT) (called a 'summons'), if the Addressee is unable to resolve the objection to the summons with the issuing party before the time for compliance, the Addressee who is objecting is required to:

a. Inform the registrar and the issuing party of the basis for the objection;
b. Attend NCAT on the date for compliance and be prepared to explain the basis for objection.
c. Objections that cannot be resolved by discussion and agreement will be referred to a Member for decision.

7.2 Steps to follow when a subpoena for sexual assault records or confidential communications records is received

7.2.1 Determine whether either privilege can be claimed in the proceedings

See **Appendix A** for a discussion of the types of proceedings in which sexual assault communications privilege must be considered and how the privilege operates.

See **Appendix B** for a discussion of the types of proceedings in which it is possible to claim professional confidential relationship privilege.

7.2.2 Family Court, Federal Circuit Court and Children's Court subpoenas

Sexual assault communications privilege and professional confidential relationship privilege are created by NSW legislation and apply in NSW courts, and may also apply in Federal Courts where a matter is heard in NSW and in the courts of other States and Territories of Australia.

If you receive a Family Court or Federal Circuit Court subpoena requesting a patient's sexual assault counselling communications records and the subpoena was not issued by the patient or the patient's legal representative, and you are concerned about producing the records, although privilege cannot be claimed, you could consider treating the records as 'sensitive records' (see Section 7.4).
Keep in mind that sexual assault communications records relating to children can be important evidence and highly relevant for the Family Court or Federal Circuit Court to have available when determining parenting orders for the care of a child.

You must file the 'notice of objection' form contained on the last page of the subpoena and serve copies of the notice of objection on each of the parties to the proceedings prior to the return date if you are objecting to the production of documents in response to a subpoena. The court will then assign a date for your objection to be heard and you will need to attend court on that day.
The Children's Court may take different approaches to objections to subpoenas depending upon the location of the court. However, if objecting to a subpoena you must ensure that the relevant Children's Court is given notice of your application to set aside the subpoena or to object to access either by mail, fax, email or in person prior to the return of subpoena. For example if the Children's Court at Parramatta receives notice of an application, the matter will be listed for directions.

7.2.3 Protected Confidence Notice

A protected confidence means a counselling communication that is made by a victim of a sexual assault. The counselling communication does not need to relate to the sexual assault and may predate the sexual assault. If a party wants production and access to a document containing a protected confidence, they must seek leave of the Court and give notice to the patient that production has been sought. Notice should also be given to the other parties. This is a requirement of the *Criminal Procedure Act 1986*.

This means that if the issuing party is aware that the documents sought contain protected confidences, the patient should have been made be aware that they can seek to appear in court on the return date to challenge the subpoena.

7.2.4 The view of the patient

Sexual assault communications privilege and professional confidential relationships privilege belong to the patient.

When a subpoena requesting sexual assault counselling records or records of a protected confidence is received the PHO should contact the patient and inform them that the subpoena has been served. The PHO should then:

(a) explain nature of the privilege which may apply;

(b) ask the patient whether s/he will consent to waive the privilege. If so, a consent to waive the privilege should be obtained from the patient in writing;

(c) if the patient does not want to waive the privilege, advise the patient of the steps (if applicable) that the PHO is taking to claim the privilege on the patient's behalf.

If the patient chooses to waive the privilege, the documents must be produced to the court.
Reasonable attempts should be made to contact the patient if a subpoena for sexual assault counselling records is received. What constitutes reasonable steps will vary depending on the individual circumstances of the patient. If the file shows that there is a potential that the patient will suffer serious harm if the records are disclosed, taking reasonable steps to locate the patient may involve doing more than attempting to telephone the patient or writing a letter, such as contacting the police for assistance. If the patient cannot be contacted, the PHO should write a letter to the court explaining this, and noting that the records contain confidential counselling material. This letter should be sent to the court with the records.
In proceedings where the patient is represented, the PHO will meet its obligation by referring the matter to the patient's legal representative.
Legal Aid NSW's Sexual Assault Communications Privilege Service (SACPS)is a state wide service that assists victims to protect the privacy of counselling notes and other confidential therapeutic records in criminal proceedings.

SACPS can assist the LHD and the victim by:

1. Providing information to health workers about privilege;
2. Advising sexual assault victims about using privilege; and
3. Providing representation in court for sexual assault victims to enforce the privilege.

SACPS can be contacted by phoning (02) 9219 5888 or emailing sacp@legalaid.nsw.gov.au.

7.2.5 Whether harm is likely to occur to the patient if the material is disclosed

The treating counsellor (or, if that person is not available, another qualified professional) should review the file and form a preliminary view as to whether harm is likely to occur to the patient from disclosure. This preliminary view will need to later be supported by the preparation of a harm statement or an affidavit. A harm statement or affidavit made by a professional with appropriate qualifications is an essential element to claiming the privilege. Before a decision is made to claim privilege, the professional/s involved should be comfortable they can adequately prepare a harm statement or affidavit for the court. If a decision is made to claim privilege, the most appropriate way to ensure the claim is argued effectively is for the PHO to obtain legal representation.

7.2.6 Determine whether the PHO should claim privilege on behalf of the patient

The following issues should be considered when deciding if the PHO should claim either sexual assault communications privilege or professional confidential relationships privilege:

- The views of the patient and whether the patient proposes to claim either privilege themselves. You may wish to refer the patient for independent legal advice. Legal Aid's SACP Service can be contacted by phoning (02) 9219 5888 or emailing sacp@legalaid.nsw.gov.au.
- Whether harm is likely to occur to the patient if the material is disclosed.

7.2.7 The harm statement or affidavit

In order to support a claim for privilege, it is necessary for the patient or the PHO to provide the court with evidence about the nature and extent of the harm that the patient would suffer if the documents were disclosed. However, specific details about the patient should not be provided – to do this would negate the purpose for the privilege claim.
If the PHO has instructed a lawyer to argue the privilege, the lawyer will advise staff on whether affidavits, or harm statements, or a combination of both, are required, and will assist staff in preparing these documents.

If the PHO does not instruct a lawyer, it may consider asking staff to draft a harm statement. When drafting harm statements, keep in mind that they are likely to be read by all parties to the proceedings.

A professional with appropriate qualifications should prepare a harm statement. It should include:

(a) the qualifications and experience of the professional preparing the statement;

(b) the employed position of the professional at the time of preparing the statement;

(c) if the person preparing the statement is the treating counsellor, the statement should state this, and explain for how long the counselling relationship has been established;

(d) if the person is not the treating counsellor, the statement should state that fact. It should explain why the treating counsellor is not available to make the statement and state that the person who is preparing the statement has read all the relevant counselling notes;

(e) a statement that the counselling notes that have been subpoenaed were made in confidence and relate to the impact of alleged sexual assaults.

(f) a statement to the effect that the symptoms, concerns, and worries of the patient would be seriously aggravated if the contents of the documents were disclosed.

(g) if applicable, a statement to the effect that the patient expected the counselling records to remain confidential.

(h) a statement that the writer of the harm statement claims sexual assault communications privilege in respect of the records.

7.2.8 Instructions to be given to lawyers engaged by the PHO to argue a privilege claim

If the PHO decides to engage lawyers to argue a claim for privilege, a letter of instruction setting out the following should be sent to the lawyers. The letter should include the following information:

- When the subpoena is returnable (attach a copy of the subpoena);
- The nature of the documents held;
- The patient's views on disclosure;
- If the patient does not wish to waive the privilege, an indication that the PHO is of the view that harm will occur to the patient if the documents are released;
- The name and contact details of the other party / parties to the proceedings (or their legal representatives);
- If the matter is a criminal matter, the name and contact details for the police officer in charge of the criminal investigation;
- The name of appropriate contact officer at the PHO;
- The date that the hearing starts. This information can be obtained from the issuing party. The date that the hearing starts will usually be a date sometime after the return date for the subpoena. This allows time for the return date for the subpoena to be adjourned by the court if the PHO wishes to put forward arguments objecting to disclosure. Where the subpoena is returnable at the start of the trial it is more difficult to negotiate additional time.
- Whether the documents have been subpoenaed before. This is important, as if the records were previously released, it will be more difficult to argue for their non-release in response to a later subpoena. Alternatively, the court may have prevented disclosure in earlier cases and made comments which may assist in arguing for non-disclosure in relation to the later subpoena.

8 PROCEDURES FOR RESPONDING TO A SUBPOENA TO PRODUCE

8.1 Should I notify anyone of the subpoena?

All subpoenas should be brought to the attention of the relevant person or branch with-in the PHO to whom the subpoena relates, for example the medical records department or, to medico-legal person or risk manager if the PHO has one. Where appropriate, the senior health care provider and the treating health care provider are to be advised (where possible) of subpoenas for health records, even if neither they nor the PHO are party to the proceedings.

Where a patient whose health record has been subpoenaed is not named on the subpoena as a party to the proceedings before the court, he or she should be notified by the PHO that the subpoena has been received and advised of the "return date" on the subpoena (i.e. the date the documents must be provided to the court) in sufficient time to allow the patient to arrange to attend the court if the patient wishes. Telephoning the patient, or writing to the patient's last known address is sufficient. A note should be made outlining measures taken to advise the patient of the subpoena.

NB: If you have concerns about the scope of a subpoena you should consult your immediate manager who may need to consult the PHO Executive and obtain advice from the PHO's solicitors if appropriate.

8.2 Are photocopies sufficient or must originals be produced?

Documents can be provided to the Court by way of:

(a) A photocopy;
(b) In PDF format on a CD-ROM;
(c) On a USB; or
(d) In any other electronic form that the issuing party has indicated will be acceptable.

Unless a subpoena specifically requires the production of the original document, photocopies of the records or a CD-ROM or USB should be provided. If the PHO is required to produce originals, it should ensure that a complete copy of the records remains with the PHO to ensure continuity of care.

8.3 What is the procedure for delivering subpoenaed documents to the court?

Documents produced under NSW subpoenas must be produced to the court at the address referred to in the subpoena and **not to** the issuing party. They should not be provided to the person who serves the subpoena, even if the matter is 'urgent'.

Documents produced on subpoena should be delivered to the Registrar or Clerk of the court in question. If the documents are produced to the court, the following procedures should be followed:

(i) The documents should be sealed in an envelope;

(ii) The PHO should allocate a unique number to the envelope from a register held by the PHO in which the name of the patient, the court to which the record is sent and the date of the hearing should be entered against the number;

(iii) a copy of the subpoena should be secured inside the envelope (if the Court requires the original subpoena, the PHO should make a copy for its records);

(iv) the PHO should keep a copy of the subpoena (and any original documents being sent to court with the subpoena); and

(v) the envelope should be delivered to the registry by hand by the return date by an employee of the PHO or by registered post, or courier not less than 2 clear working days before the return date specified in the subpoena.

On delivery, if practicable, a receipt should be obtained from the court which indicates the number of the record, the date the record was received at the court, the name of the court and the signature of the court official receiving the record.

If the PHO is a party to the proceedings in which the subpoena has been issued, or has sought legal advice in relation to the subpoena, the documents collated in response to the subpoena should be forwarded to the solicitor who is acting on behalf of the PHO. That solicitor will review the documents and arrange for them to be forwarded to the court on behalf of the PHO.

8.4 Can any additional precautions be taken for sensitive records?

A subpoena cannot be challenged merely because it requests sensitive records.

When responding to a subpoena that requests sensitive information (and where there are no grounds for setting aside the subpoena or claiming privilege over the documents), the following steps should be followed.

(a) Contact the issuing party and ascertain why the information is required. It may be possible to negotiate with the issuing party to either exclude these records from production, or produce copies of the records with the names of the affected people deleted.

(b) Request that the court limit access to the documents to certain people. For example, courts can give orders limiting access to the parties' legal representatives and independent experts on the condition that they give confidentiality undertakings. The responsibility for raising this issue rests with the subpoenaed party. A letter should be sent to the court setting out the concerns arising if the documents are provided in open court. The letter should not contain any sensitive information itself.

The documents to be produced, should be placed in a separate envelope marked "Sensitive – access restricted", however, this is no guarantee that the Court will treat these records differently.

9 WHAT HAPPENS AFTER THE DOCUMENTS HAVE BEEN PRODUCED

9.1 Who can see the documents after they have been produced to the court?

After documents have been produced to court, the court will make orders about who may access them. Usually, the parties to the proceedings and their legal representatives will be granted access to the documents.

If a patient's medical record has been produced to court, and the patient is also a party to the proceedings, his or her legal representative may ask for 'first access'. This means that the patient's legal representative can inspect the records before the other parties, in order to determine whether a privilege claim can be made to limit further access to the documents.

The question of who may have access, whether a party will have first access, or whether any other special access orders will be made, is often determined on the return date.

The following courts determine access issues in particular ways.

District Court – civil claims

The issuing party in a District Court civil matter is required to include a "proposed access order" on the subpoena. This is an order for access that the issuing party thinks is appropriate. For example, the proposed access order may be "plaintiff to have first access to the documents for 7 days". This type of access order may be appropriate if the plaintiff was the patient whose records had been produced, as it would allow the plaintiff/patient's solicitor to view the records and determine whether any claims for privilege should be made, prior to the other parties accessing the records.

If the PHO wishes to object to the proposed access order (for example, if a privilege is being claimed), the PHO should first notify the issuing party to attempt to negotiate an agreement as to what the proposed access order should be. If an agreement cannot be reached, a representative of the PHO, or the PHO's legal representative will be required to appear at Court on the return date and argue the question before the presiding registrar (see Section 8.1).

In any District Court civil case where there is no appearance at the return date, the proposed access order will be made automatically by default.

Supreme Court

A subpoena in the Supreme Court must include either a proposed access order for the documents to be produced and reasons for that order, or default access orders. Default access orders means general access to all parties, and includes permission to copy documents.

If a general access order allowing all parties access to the subpoenaed documents at the same time is not objected to, the Supreme Court will automatically make a default order for general access to the documents at the return date.

If PHO wishes to object to a general access order being made (for example, by claiming a privilege), it should notify the party that issued the subpoena and attend court, or arrange for a lawyer to attend court, on the return date and inform the Registrar of its position.

9.2 What if I receive a request for permission to 'uplift' documents?

Courts have photocopying facilities available on site; however, occasionally parties to litigation seek permission from the court to uplift, or temporarily remove the documents from the court to arrange for them to be copied externally, or reviewed in a more convenient setting. A party may request to uplift x-rays or scans which have been provided to the Court in order to obtain a copy to provide to a medical expert for an opinion. The documents are then returned to the court.

As the documents still belong to the subpoenaed party while they are at the court, some courts seek the consent of the subpoenaed party before they will allow the documents to be uplifted.

If a PHO is asked to consent to a party uplifting record, it is recommended that:

- If original documents have been produced, consent to uplift should generally be refused;
- If copies have been produced, consent can be granted on the basis that the documents do not leave the custody of the parties' legal representatives and/or the medical or other professional expert whom the parties' legal representatives have engaged to provide an expert opinion and the document/s are returned to the court in the same condition.

If a court allows documents to be uplifted, it will normally require the legal representative uplifting them to sign a receipt, accepting responsibility for the records whilst they are in the legal representative's possession.

9.3 Are subpoenaed documents returned?

Original documents should always be returned to the PHO.

Subpoenaed documents that are copies should be returned by the court at the conclusion of the matter, unless the PHO has informed the court that the documents may be shredded. If you have any queries contact the Clerk or Registrar of the court.

10 REQUESTS FOR INFORMATION UNDER THE CHILDREN AND YOUNG PERSONS (CARE AND PROTECTION) ACT

10.1 Requests for information under Chapter 16A of the *Children and Young Persons (Care and Protection) Act 1998 (NSW)*

Chapter 16A of the *Children and Young Persons (Care and Protection) Act* provides a mechanism for NSW Health staff to exchange information with other human services and justice agencies, to ensure the safety, welfare and wellbeing of children and young people in NSW.

Please refer to the NSW Health Policy Directive *Child Wellbeing and Child Protection Policies and Procedures for NSW Health* PD2013_007 where NSW Health's policy on child protection information exchange is set out in full.

10.2 Requests for information from Family and Community Services

Pursuant to Section 248 of the *Children and Young Persons (Care and Protection) Act*, PHOs may be required to provide information to Family and Community Services. Section 248 is designed to allow an exchange of information about the safety, welfare and wellbeing of children and young people between an agency and Family and Community Services.

Information can only be provided in response to a Section 248 request if it relates to the safety, welfare and wellbeing of a particular child or young person.

Once records have been provided to Family and Community Services in answer to a Section 248 request, Family and Community Services may use them as evidence in legal proceedings. If records are to be used in legal proceedings, they are usually annexed to an affidavit (a sworn statement) prepared by Family and Community Services staff in accordance with arrangements agreed upon between NSW Health and Family and Community Services. Family and Community Services staff are not to attach confidential information provided in response to a Section 248 request to affidavits without the consent of the person who provided the information.

If the document that Family and Community Services wish to attach to the affidavit is particularly sensitive, the PHO should refuse to consent (unless the patient's guardian does not object), and ask Family and Community Services to issue a subpoena seeking a copy of the document instead. Once a subpoena has been served, the PHO may consider whether production can be opposed, or whether any type of privilege can be claimed in respect of the document.

For more information regarding responding to S248 requests refer to to the NSW Health Policy Directive *Child Wellbeing and Child Protection Policies and Procedures for NSW Health* PD2013_007.

11 PRIVACY

Compliance with a subpoena is required by law. Complying with a subpoena will not breach the PHOs obligations under the *Health Records Information Privacy Act 2002* and *Privacy and Personal Information Protection Act 1998* as it is a lawful excuse to release information as long as you provide documents within the scope of the subpoena. For further information about privacy obligations, see Privacy Manual for Health Information.

12 SUBPOENA TO GIVE EVIDENCE

12.1 What should I do if I receive a subpoena to give evidence?

A subpoena to give evidence will require the named person to attend a court on a particular date to be a witness in a hearing and give evidence. The subpoena will be addressed to a specific individual and will indicate the time and place the person will be required to give evidence as a witness.
A person who receives a subpoena should report that fact to his/her administrator/supervisor as soon as practicable.
A person who has been subpoenaed should contact the solicitor who requested the issue of the subpoena to:

(a) confirm that their attendance is still required;
(b) to obtain some better guidance as to when he or she might be required to give evidence; and
(c) confirm that if the solicitor who has issued the subpoena requires the witness to remain on 'standby' rather than come to Court, sufficient notice will be provided if the witness is to be called to Court so that alternative work arrangements can be made.

If the solicitor indicates that a person's attendance is not required, this should be confirmed in writing.

12.2 How much conduct money should I receive if I am required to attend court to give evidence?

Witnesses are entitled to receive conduct money and reasonable expenses from the solicitor or person who has issued the subpoena. Conduct money means a sum of money, or its equivalent, such as pre-paid travel, sufficient to meet the reasonable expenses incurred by the subpoenaed party in attending court as required by the subpoena, and returning from court after attending.

When a subpoena to give evidence is served on a person, the person named is not required to attend court unless conduct money has been handed or tendered to the named person a reasonable time before the date on which attendance is required.
If there is a dispute about conduct money the named person should contact the person who has issued the subpoena and negotiate further conduct money. If no agreement has been reached, but some conduct money has been provided at the time the subpoena was served, the person should still attend the court on the date specified in the subpoena, but advise the court that the conduct money provided is not reasonable and seek an Order from the court that additional conduct money be paid by the person who issued the subpoena.
For medical officers, the AMA has published guidelines relating to reasonable expenses.

13 APPENDIX A – SEXUAL ASSAULT COMMUNICATIONS PRIVILEGE

The Sexual Assault Communications Privilege is set out in the *Criminal Procedure Act 1986*. This privilege protects counselling communication made by, to or about a victim or alleged victim of a sexual assault offence. The Act does this by:

- Requiring the leave (permission) of the court prior to issuing a subpoena seeking access to this information;
- Requiring the leave (permission) of the court prior to accessing documents produced in response to a subpoena; and
- Requiring the leave (permission) of the court prior to this information being used in evidence.

The privilege applies to information regardless of whether it is in written form (for example, a client's file) or in oral form (for example, a health worker being subpoenaed to give evidence).

The privilege applies to criminal, Apprehended Violence orders and some civil proceedings in NSW and may also apply in the courts of other States and Territories of Australia.

13.1 What are counselling communications?

Counselling communications are defined in the Act to include communications made by a person in confidence to a counsellor who is counselling the person in relation to any harm the person may have suffered.

Counselling communications also include communications made in confidence by the counsellor, or by a parent, carer or other support person who is present in the counselling to facilitate communication or to otherwise further the counselling process.

The Act provides that a person counsels another person if the person has undertaken training or study or has experience that is relevant to the process of counselling persons who have suffered harm and the person:

(a) listens to and gives verbal or other support or encouragement to the other person, or

(b) advises, gives therapy to or treats the other person

whether or not for fee or reward.

This wide definition is likely to include counselling provided by a counsellor, health care worker, social worker or youth worker.

A counselling communication is a protected confidence even if:

(a) it was made before the relevant sexual assault offence occurred, or is alleged to have occurred, or

(b) was not made in connection with a sexual assault offence or alleged sexual assault offence.

This means that the privilege could apply to any counselling communications, and not just to counselling following a sexual assault (for example, the privilege could apply to drug and alcohol counselling provided prior to the sexual assault taking place).

13.2 A counselling communication may be made in confidence even if it was made in the presence of a third party if the third party was present to facilitate communication or to otherwise further the counselling process. Can the sexual assault communications privilege be claimed in all types of court proceedings?

The sexual assault communications privilege can be claimed in criminal proceedings, including proceedings relating to Apprehended Violence Orders ("AVOs").

The privilege applies in any courts that exercises criminal jurisdiction, any may also apply in federal courts, such as the Family Court or Federal Circuit Court, and in the courts of other States and Territories of Australia. The federal court or courts of other States and Territories will consider the application of the privilege in the context of their local laws.

The sexual assault communications privilege can also be claimed in civil proceedings in NSW, but only if:

(a) substantially the same acts are in issue in the civil proceedings as were in issue in relation to previous criminal proceedings; and

(b) the evidence was found to be privileged in the previous criminal proceedings.

13.3 Principles applying to sexual assault subpoenas

In the first instance, where a subpoena is received for patient records that may contain sexual assault communications, attempts should be made to contact the patient and advise that a subpoena has been received for their records and indicate they should seek legal advice. If the patient is not a party to the proceedings (for example, in criminal proceedings) they may not be aware that their records have been subpoenaed.

PHOs have an obligation to their patients to take steps to protect confidential sexual assault counselling communications from being disclosed where disclosure would harm the patient.

This obligation is most critical where the patient is a child, or where the disclosure is sought in relation to criminal proceedings and the victim of the assault does not have legal representation. In these cases, the PHO may consider obtaining legal representation to challenge the production of documents under the subpoena.

In cases where there is a high risk of serious harm such as, for example, a high likelihood of suicide or self-harm to the patient if the records are disclosed, the PHO should consider obtaining legal representation to challenge the production of material in response to the subpoena. Harm can be actual physical bodily harm, financial loss, stress or shock, damage to reputation or emotional or psychological harm (such as shame, humiliation and fear).

In proceedings where the patient is represented, the PHO may meet its obligation by referring the matter to the patient's legal representative.

If the patient has legal capacity and chooses to waive the privilege, the PHO must respect that decision.

13.4 How does sexual assault communications privilege operate?

13.4.1 Preliminary Criminal Proceedings

Preliminary criminal proceedings are committal or bail proceedings (whether or not they relate to a sexual assault offence).
In preliminary criminal proceedings:

(a) a person cannot seek to compel any other person (whether by subpoena or any other procedure) to produce a document recording a protected confidence;

(b) a document recording a protected confidence cannot be produced; and

(c) evidence cannot be adduced if it would disclose a protected confidence or the contents of a document recording a protected confidence.

13.4.2 Criminal Proceedings

Criminal proceedings include those relating to the trial or sentencing of a person for an offence (whether or not they relate to a sexual assault offence) and also proceedings for an AVO.
In criminal proceedings, unless the court grants leave:
(a) a person cannot seek to compel any other person (whether by subpoena or other procedure) to produce a document recording a protected confidence;
(b) a document recording a protected confidence cannot be produced; and
(c) evidence cannot be adduced if it would disclose a protected confidence or the contents of a document would recording a protected confidence.
The court will not grant leave unless the court is satisfied that;

(a) the document or evidence will have substantial probative value; and

(b) other documents or evidence concerning the matters to which the protected confidence relates are not available; and

(c) the public interest in preserving the confidentiality of protected confidences and protecting the victim from harm is substantially outweighed by the public interest in admitting into evidence information or the contents of a document of substantial probative value.

The court is also required to take into account certain matters, including the need to encourage victims of sexual offences to seek counselling and the fact that disclosure is likely to undermine the relationship between counsellor and patient.

13.4.3. Civil Proceedings

The privilege can only be claimed in a civil proceeding where substantially the same acts are in issue as the acts that were in issue in relation to a criminal proceeding.
Where evidence was found to be subject to sexual assault communications privilege in the criminal proceeding, that evidence may not be adduced in the civil proceeding.
In civil proceedings where the *Uniform Civil Proceedings Rules 2005* apply, a party can also object to production of a document on the basis of the privilege in these circumstances, and cannot be compelled to produce the document until the objection is overruled.
If you have received a subpoena to produce in a civil proceeding where the documents cover sexual assault communications, you should make enquiries as to whether there were criminal proceedings in relation to the acts which are the subject of the communications.
If you are unable to make such enquiries, you should place the documents into a sealed envelope marked "**Sexual assault communications – may be subject to s 126H of the Evidence Act 1995**" when producing the documents to the court.

13.5 What happens if there is a dispute about whether a document or evidence contains a protected confidence?

If a party has requested leave to subpoena documents that contain a protected confidence or to adduce evidence that contains a protected confidence, notice must be given in writing to each other party and the patient. A patient who is not a party may appear in criminal proceedings if this occurs.

If you have received a subpoena that covers sexual assault communications and you are unsure if leave has been sought, you should contact the relevant Registry and object to production until such time as the Registry confirms leave has been granted.

If leave has been granted, objection to access may still be made.

Before a court can make a decision about the documents, they must be produced to court, with an objection to their production noted, so the court can rule on the objection. This means that the PHO must produce the documents to the court in a sealed envelope marked "**Sexual assault communications privilege claimed**". The court will inspect the documents in order to determine whether the claim for privilege will be upheld. Some courts will not uphold a claim for privilege without hearing legal argument from the issuing party and the subpoenaed party. PHOs should recognise that producing the documents marked privilege may not be sufficient for a claim for privilege to be successful. Legal argument may be necessary.

The court can also make orders to limit the possible harm, or the extent of the harm caused, for example, by ordering that evidence is to be heard 'in camera' (in a closed court), or making orders suppressing the publication of the evidence, or part of the evidence, or the identity of the confider. The court may also make orders limiting who may inspect documents produced.

14 APPENDIX B – PROFESSIONAL CONFIDENTIAL RELATIONSHIP PRIVILEGE

14.1 What is a protected confidence for the purpose of claiming professional confidential relationship privilege?

A protected confidence is a communication made by a person, in confidence, to another person in the course of a relationship in which the confidant was acting in a professional capacity and where the confidant was under an express or implied obligation not to disclose the contents of the communication. A communication may be made in confidence even if it is made in the presence of a third party if the third party's presence is necessary to facilitate communication.

A protected confidence may include a communication between a health professional and a patient. The definition potentially covers many aspects of clinical records.

The aim of the privilege is to protect marginalised groups (other than victims of sexual assault in relation to whom the sexual assault communications privilege may apply) such as mental health patients and HIV positive patients, who may not seek medical treatment if they are concerned that professional confidentiality will not be maintained.

The rationale for the privilege is that some relationships between health professionals and patients will be severed, if trust and confidentiality are not maintained. This rationale may not apply to a patient's relationship with a Hospital or PHO, where the patient is treated by a team, and may not form a special relationship with a particular health professional.

14.2 Can the professional confidential relationship privilege be claimed in all types of court proceedings?

The privilege can be claimed in all NSW courts or federal Courts operating in NSW, such as the Family Court or Federal Circuit Court, and in the courts of other States and Territories of Australia. The federal court or courts of other States and Territories will consider the application of the privilege in the context of their local laws.

14.3 How does professional confidential relationship privilege operate?

The court may direct that evidence not be used in proceedings, if the court finds that using it would disclose a protected confidence, or the contents of a document recording a protected confidence.

The court can come to this decision on its own initiative, or on an application from the protected confider (the patient) or the confidant (the health professional).

The court must decide not to use evidence about a protected confidence if, it is likely that harm would be caused to the protected confider (the patient) if the evidence is used and if the nature and extent of the harm outweighs the desirability of the evidence being given. It is generally desirable, however, for the evidence to be given. The more important the evidence is, particularly if it is not available from an alternative source, the more desirable it is.

Harm includes actual physical bodily harm, financial loss, stress or shock, damage to reputation or emotional or psychological harm (such as shame, humiliation and fear).

The court can also make orders to limit the possible harm, or the extent of the harm caused, for example, by ordering that evidence is to be heard ‘in camera’ (in a closed court), or making orders suppressing the publication of the evidence, or part of the evidence.

The privilege can be waived if the confider consents.

14.4 What will the court take into account when deciding whether the privilege applies?

The court will consider a range of factors, including the following:

(a) the extent to which the evidence could affect the assessment of a fact in issue in the proceedings;

(b) the importance of the evidence in the proceeding;

(c) the nature and seriousness of the relevant offence, cause of action or defence and the nature of the subject matter of the proceeding,

(d) the availability of any other evidence concerning the matters to which the protected confidence or protected identity information relates,

(e) the likely effect of using evidence of the protected confidence, including the likelihood of harm, and the nature and extent of harm that would be caused to the patient,

(f) the means available to the court to limit the harm or extent of the harm that is likely to be caused if evidence of the protected confidence or the protected identity information is disclosed,

(g) if the proceeding is a criminal proceeding—whether the issuing party is a defendant or the prosecutor, and

(h) whether the substance of the protected confidence or the protected identity information has already been disclosed by the patient or any other person.

15 APPENDIX C – COMMON COURTS AND TRIBUNALS

15.1 The Family Court of Australia and Federal Circuit Court of Australia

The Family Court and Federal Circuit Court resolve and determine family disputes, including disputes about the care, custody and maintenance of children.

The Family Court also provides consent for special medical treatment (such as sterilisation, surgical gender reassignment and the harvest of bone marrow blood cells from a disabled child for transplantation into a relative) to be carried out on minors.

15.2 The Supreme Court of New South Wales

The highest court in the State is the Supreme Court of NSW. It has unlimited civil jurisdiction and handles the most serious criminal matters.

The Supreme Court also deals with Adoption matters and has *parens patri* jurisdiction which can include applications related to the care and protection of children and young persons, medical treatment, and secure detention.

The Court of Appeal and Court of Criminal Appeal hear appeals from decisions made in most of the Courts of New South Wales and from decisions made by a single judge of the Supreme Court.

15.3 The District Court of New South Wales

The District Court deals with criminal and civil cases. The District Court has jurisdiction to hear:

(a) all indictable criminal offences (except murder, treason and piracy); and

(b) civil matters with a monetary value up to $750,000, - or greater with the consent of the parties. The Court also has an unlimited jurisdiction in respect of motor accident cases and work injury damages cases.

The Court's judges hear appeals from the Local Court and also preside over a range of administrative and disciplinary tribunals.

15.4 The Local Court of New South Wales

The Local Courts are the courts of general access in New South Wales. There are 157 Local Courts in NSW. They have jurisdiction to deal with:

- the vast majority of criminal and summary prosecutions;
- civil matters with a monetary value of up to $100,000;
- committal hearings;
- family law matters;
- child care proceedings;
- juvenile prosecutions and care matters; and
- coronial inquiries.

In the Local Court, Magistrates hear criminal cases that do not need a judge and jury. These are called summary offences and include traffic matters, minor stealing, offensive behaviour, and some types of assault. Magistrates also hear applications for apprehended violence orders where one person is seeking a restraining order against another.

A Magistrate conducts committal proceedings to decide if there is enough evidence for a serious matter, such as armed robbery, or attempted murder, to go before the District Court or the Supreme Court.

Children's Courts deal with criminal matters involving children who are younger than 18 and care applications concerning children who are in need of care or protection.

15.5 The NSW Civil and Administrative Tribunal

The NSW Civil and Administrative Tribunal ("NCAT") was established on 1 January 2014 by the *Civil and Administrative Tribunal Act 2013* (NSW), consolidating the work of 22 former tribunals (including the Guardianship Tribunal, Administrative Decisions Tribunal and the occupational tribunals) into a single specialist tribunal service. NCAT is made up of four divisions:

- Consumer and Commercial;
- Occupational;
- Guardianship; and
- Administrative and Equal Opportunity.

NCAT deals with a broad range of matters including review of administrative decisions made by government agencies, discrimination matters, complaints concerning professional conduct and discipline and determining applications for guardianship.

15.6 Workers Compensation Commission

The Workers Compensation Commission deals with workers compensation disputes arising out of work related injury or disease suffered by a worker in New South Wales. In addition, the Commission administers medical panels which assess a worker's condition or fitness for employment in circumstances specified in legislation.

15.7 Coroner's Court of New South Wales

Coroners are situated around New South Wales in Local Courts. They inquire into the circumstances surrounding deaths that are reported to them.

The State Coroner's role is to ensure that all deaths, suspected deaths, fires and explosions which are under the Coroner's jurisdiction are properly investigated, and where the law requires an inquest to be held, or in cases whether the Coroner believes an inquest is necessary, a full inquest is undertaken.

15.8 Drug Court of New South Wales

The Local or District Court in the defined catchment area must refer offenders who appear to meet the Drug Court obligatory criteria, to the Drug Court.

The aim of the Drug Court is to protect the public by ensuring drug dependent offenders engage in longer term treatment. The Court works in collaboration with a number of other organisations. These include Corrective Services NSW and NSW Health.

15.9 Dust Diseases Tribunal

The Dust Diseases Tribunal hears and determines claims for dust related diseases suffered as a result of exposure to dust. Dust diseases include mesothelioma, asbestosis, silicosis and certain types of lung cancer. The Dust Diseases Tribunal follows the procedural rules of the Supreme Court of New South Wales.

15.10 Children's Court of New South Wales

The Children's Court is a specialist court to deal with criminal cases, applications for apprehended violence orders, applications for compulsory schooling orders and cases involving the care and protection of children.

15.11 Industrial Relations Committee

The NSW Industrial Relations Commission is the court which hears matters relating to the workplace. The role of the Commission is to regulate workplace affairs in NSW and arbitrate to resolve industrial disputes.

HEALTH RECORDS AND MEDICAL/CLINICAL REPORTS - CHARGING POLICY (PD2006_050)

PD2006_050 rescinds PD2005_235.

The contents of this policy directive are to be effective from the date of issue and replaces PD2005_235 (dated 14 February 2002).

The following relates to charges for health records and medical/clinical reports that are to apply unless specific legislation specifies a lesser rate or exemption from fees. Health Services should develop local policies, which detail the content of records and reports as they relate to these charges. These policies should take into account the function of the health facility, the type of report produced and the amount of information to be provided.

Rates are advised separately via Information Bulletin.

The decision to charge for requests for health records and medical/clinical reports from researchers is a matter for local determination depending upon the type of request and possible future benefit to the health system. Such charges should be determined on a cost recovery basis.

For the purposes of this policy directive a health record is defined as a documented account, whether in hard or electronic form, of a client/patient's health, Illness and treatment during each visit or stay at a health service (and includes a medical record).

Charges relating to categories A, B and C (below) are taxable supplies (ie subject to GST) unless deemed GST - free under the provisions of the '*A New Tax System (Goods and Services Tax) Act 1999*' (*GST Act*). The criteria to be followed by the Area Health Services/Hospitals in assessing the GST status are advised in the GST section of this circular. Please note that where the service is determined as being 'GST-free' the rates as advised by Information Bulletin apply. Where the GST free test is not satisfied the service is therefore a taxable supply (subject to GST) and the rates as advised by Information Bulletin are to be grossed-up by 10%.

A CHARGES FOR MEDICAL/CLINICAL REPORTS apply based on the following categories:

1. Preparation of a medical report by a medical practitioner appointed to or employed by the health institution/hospital **requiring no further examination of the patient.** This applies to the treating medical practitioner or a medical practitioner who has not previously treated the patient.
2. A report made by a **treating** medical practitioner appointed to or employed by the health institution/hospital **where a re-examination of the patient is required.**
3. A report made by a medical practitioner appointed to or employed by the health institution/hospital **who has not previously treated the patient where an examination is required.**
4. Preparation of a report by an **allied health professional, other than a medical practitioner,** appointed to or employed by the health institution/hospital.

B OTHER CHARGES apply based on the following criteria:

1 (a) Charges for access to clinical notes requested by a patient/client, or by a person acting on behalf of the patient.

A patient/client can apply for access to their own personal health information held by a public health organisation, by contacting the medical records department for that organisation. In addition, the *Freedom of Information Act 1988* and the *Health Records and Information Privacy Act 2002* provide a statutory right for individuals to apply for access to information held about them.

These laws also allow for other persons to apply for access to a client/patient's personal health information. A person can apply for access on behalf of the patient/client with their consent, such as a solicitor, interpreter or employer. Alternatively, where the patient lacks the capacity to consent, or is deceased, a person who is the authorised representative for the patient/client can apply for access to the patient/client's personal health information.

NB. Further details are contained in NSW Health Privacy Manual Version 2, Sections 5.6 and 11.2.2.

Copies of clinical notes supplied in response to the above requests may typically include, as a minimum: patient registration/front sheet, consent to treatment, discharge summary, referral/transfer letters, ambulance report, continuation notes, operation reports (including anaesthetists and nursing reports), radiology and pathology reports, and nursing care plan. Where additional information is held by a hospital but not routinely released, the person making the request should be made aware that such additional information exists but has not been supplied. A further request for such additional information should be considered as forming part of the original request and no additional charge (other than photocopying, where appropriate) should be raised.

(b) Charges for information requested by an insurer.

Health facilities should not provide clinical notes or photocopies of notes to the insurer, but may supply a "Medical Report" or "Summary of Injuries" (Section A or C) if provided with a Statutory Declaration signed by the claimant on the insurer's claim form in respect of Compulsory Third Party (CTP) insurance or a declaration signed by the claimant on the insurer's claim form in respect of Workers Compensation Insurance. Such reports should only provide information **relevant to the claim.** This will necessitate the insurer detailing the nature of the claim. Health facilities will be required to exercise their judgement in determining what is relevant information. A photocopy of the CTP Statutory Declaration is acceptable irrespective of the date of signing.

If clinical notes, or part of the clinical notes, are requested by an insurer, the insurer should be requested to provide written consent from the patient stating that the patient:

- agrees to allow the insurer to have a copy of all or part of the clinical notes and
- the patient is aware that clinical notes, or part of the clinical notes, will inevitably include confidential medical information, which is irrelevant to the claim.

In the absence of clearly documented written consent, as detailed above, hospitals are not required to provide clinical notes to insurers.

The charge applicable in respect of 1(a) and 1(b) (above), which includes search fee, photocopying charges, labour costs, administrative charges and postage, is based on the following criteria:

- A set fee for the provision of a copy of the medical record, or part thereof, eg continuation notes, pathology reports, charts. (Maximum eighty pages.)
- An additional per page rate in excess of eighty
- An additional charge at cost recovery for the provision of other material (eg reproduction of X-rays, audiovisual tapes, copies of photographs & operation footage contained on DVD's).

Where a patient wishes to access her/his records under the *Freedom of Information Act*, the requirements of that Act (including charges) apply.

2 **Search Fees** - Other than requests made by a party concerned with a patient's continued treatment or future management.

The search fee should be charged:

- for searching for the health record, irrespective of whether the health record is found. If however, the Patient Master Index (PMI) or other indexes showed that the patient was treated in that health institution but the record cannot be found because it has been destroyed, misplaced or lost, the fees should be refunded in full;
- where the applicant subsequently advises that a report/record is no longer required, or where a thorough search has ascertained that the patient has never attended that health institution for that particular episode of illness;
- for information on date or time of birth, including requests from the Registry of Births Deaths and Marriages in relation to enquiries on hospitals to verify birth details;
- for Motor Accident and Work Cover medical certificates completed at other than time of consultation;
- **NOTE** - The search fee is a component of the fees charged for the preparation of reports, summaries or the production of health records required by subpoena, ie additional fees should **not** be charged on top of those for the preparation of reports, summaries and the production of health records required by subpoena.

The fee covers processing time, which includes time for locating the information, decision-making and consultation where necessary.

C **SUMMARY OF INJURIES** charges apply based on the following:-

"Summary of Injuries" - this is generally requested by Compulsory Third Party Insurers for patients whose fees are covered by the Bulk Billing Agreement.

The "Summary of Injuries" should include:

- Identifying information (name, date of birth, medical record number)
- Date of first attendance,
- Whether patient was admitted. If so, specify dates,
- Positive findings on examination,
- Level of consciousness, if documented,
- Diagnosis, if known.

A standard form letter may be appropriate.

If a discharge summary, or appropriate correspondence that provides this minimum information, is available at the time of the request, a copy of this may be sufficient. Should further information be required, the appropriate report charge as applicable to Section A or B should be raised. There is no requirement to provide the full clinical notes to third party insurers.

The purpose of the "Summary of Injuries" in relation to the bulk-billing agreement is to establish that the admission occurred as a result of a motor vehicle accident.

If the information contained in the "Summary of Injuries" is insufficient or unavailable and a medical practitioner (or other treating health professional, where appropriate) is required to prepare a report, charges for a medical report (or report by a treating health professional) should be raised.

Health Information Managers should consult with the requesting solicitor/insurer/other party to determine which is required before a fee is raised or report is prepared.

Goods and Services Tax (GST) in relation to categories A, B & C (above).

In relation to categories A, B & C above the fees/charges set by NSW Health that are taxable supplies or that Health Services are to consider for GST implications are as follows:

- Where revenue derived from the preparation of Clinical Reports is in the context of the Medical Officers Rights of Private Practice the service is to be regarded as a taxable supply.
- Where the income derived is treated as public hospital revenue, consideration is to be given as to whether it satisfies GST-free status under section 38-250 of the '*A New Tax System (Goods and Services Tax) Act 1999*' (*GST Act*).
  ie. Supplies are GST-free if:-
  - the charge is less than 50% of the GST inclusive market value of the supply; or
  - the charge is less than 75% of the cost to the supplier of providing the supply.
- NB. Further details are contained in section 3.3 (pages 22 to 24) of the "NSW Health - Finance and Commercial Services - Tax Reform - GST Manual" which is available on the NSW Health Intranet.
- All Area Heath Services need to ensure that documentation/systems exist to compare the costs (including overheads) of providing health records and medical reports, and being able to assess the GST status as detailed above.
- Where the service is determined as being 'GST-free' the rates advised by Information Bulletin apply,
  or
- Where the GST free test is not satisfied the service is therefore a taxable supply (subject to GST) and the rates advised by Information Bulletin are to be grossed-up by 10%.

D HEALTH RECORDS REQUIRED TO BE PRODUCED BY SUBPOENA

This refers to the retrieval of all the information required by the schedule noted on the subpoena and forwarding it to Court.

Charges apply based on the following:

1. where at least 5 working days notice is given for the production of the record to Court
2. where less than 5 working days notice is given

plus a photocopying charge per page as advised by Information bulletin.

- Multiple requests on a subpoena should be charged on a fee-per-patient basis.
- In a situation where no record is found, it is appropriate to raise a Search Fee for each record, particularly in situations where incorrect details are given or "blanket" subpoenas are issued and considerable time is spent in locating the record. However, if the PMI or other indexes shows that the patient was treated in that health institution but the record cannot be found because it has been destroyed, misplaced or lost, the search fee should not be charged.
- Charges under this category are not subject to GST as they are **'out of scope'** under a Division 81 Determination.
- Reference should also be made to **PD2010_065** headed 'Subpoenas', which outlines legislative provisions and procedures to be followed when public health organisations are required to produce documents on subpoena.

E ADMINISTRATIVE PROCEDURES

1 Policies and procedures regarding access to health records and disclosure of personal information should be made in accordance with the NSW Health Privacy Manual Version 2.

2 Applicants should be asked to put all requests in writing and to provide as much information as possible. A patient's solicitor should include consent by the patient for access to personal records as detailed in the Information Privacy Code of Practice.

3 Where the original of a health institution's health record leaves the institution (eg health records being tendered to a Court under subpoena), a copy of those records should generally be made beforehand and kept in the institution. Charges for photocopying should be charged at the appropriate per page rate as advised by Information Bulletin. This charge does not apply to Coroner's or Complaints Unit cases.

4 Charges should be collected in advance, where appropriate. For government departments, reimbursement may be sought subsequently from the relevant department or authority. Even where health records are required to be produced by subpoena, payment should still be sought in advance. It is emphasised that a hospital or organisation is expected to comply in due time with the requirements of a subpoena. Non-compliance may result in contempt of Court, which is punishable by fine or in certain cases imprisonment.

5 It may be decided that an examination of the patient (by either the treating medical practitioner or a medical practitioner who has not previously treated the patient) is required. Under such circumstances, the applicant should be asked to pay the balance of the money for the higher fee before proceeding with the request.

6 Fees collected are to be recorded as revenue in the General Fund.

7 Where there are disputes regarding fees or the amount of information, attempts should be made to resolve the matter between the parties involved. This would normally involve the Chief Health Information Manager and/or the General/Medical administration of the health facility.

F CIRCUMSTANCES UNDER WHICH A CHARGE SHOULD NOT BE RAISED

1 When the request has been made by a party concerned only with the patient's continued treatment and/or future management, no charge should be raised (eg where a medical practitioner requests information from a health institution to assist him/her with that patient's treatment);

2 The GIO or EML as Managers, Treasury Managed Fund or solicitors acting for the GIO or EML in such matters, in respect of claims for workers compensation for employees of Public Hospitals, Public Psychiatric Hospitals (former 5th schedule hospitals), the NSW Ambulance Service and the NSW Department of Health. Health facilities should ensure that solicitors acting for the GIO or EML specify in writing that this is the case;

3 Medical Services Committees of Inquiry established by the Commonwealth Government for purposes of detecting fraud and controlling over servicing;

4 The Department of Community Services or the Police in respect of children suspected of being abused, or of a parent of a child so suspected;

5 The completion of medical certificates at the time of consultation - no charge should be made as the forms for motor accident and WorkCover certificates are in the nature of a certificate and not a report. If not completed at the time of consultation, a search fee may be raised.

G CIRCUMSTANCES UNDER WHICH CHARGES SHOULD BE RAISED

In all cases where the conditions in Section F have not been met including:

1 When medical reports/records are requested by individuals, solicitors, insurance companies, health professionals and government departments (with the exception of those indicated in Section F) for purposes other than the patient's continued treatment or future management.

2 The Department of Veterans' Affairs and Centrelink for the purpose of pension/benefits assessment;

3 Interstate Health Authorities in respect of the eligibility of candidates for appointment to the relevant Public Service.

4 NSW Compulsory Third Party Insurers, in respect of a "Summary of Injuries". (Refer to Section C).

5 Release of information under the NSW *Adoption Information Act 1990*. Charges should be raised in accordance with PD2016_036 or any document subsequently amending its provisions.

ENQUIRIES

- pertaining to the **level of charges and GST implications** refer to the latest Information Bulletin on 'Charges for Health Records and Medical/Clinical Reports and the "NSW Health - Finance and Commercial Services - Tax Reform - GST Manual" (available on the NSW Health Intranet site) respectively or contact Trevor Smith, Finance and Business Management on (02) 9391 9158.
- pertaining to **access of information** refer to Privacy Manual for Health Information (March 2015), or contact Legal Branch on 9391 9606.
- pertaining to **records management policy** should be referred to the Informatics Senior Project Officer on (02) 9391 9155.

57(9/06)

Health Records and Medical/Clinical Reports rates and Fees for Cremation Certificates Issued by Salaried Medical Practitioners of Public Hospital are advised annually by Information Bulletin. Refer to the Policy Distribution System for the latest Information Bulletins. https://www.health.nsw.gov.au/policies/Pages/default.aspx

CONSENT TO MEDICAL AND HEALTHCARE TREATMENT (IB2020_010)

IB2020_010 rescinds PD2005_406

PURPOSE

The purpose of this Information Bulletin is to advise of the release of the *Consent to Medical and Healthcare Treatment Manual.*

KEY INFORMATION

An electronic version of the Manual can be found on the health website at: https://www.health.nsw.gov.au/policies/manuals/Pages/consent-manual.aspx

The Consent Manual replaces PD2005_406 *Consent to Medical Treatment – Patient Information. (***Note***:* PD2005_406 is rescinded).

The Consent Manual provides operational guidance and procedures to support compliance with the NSW law on obtaining consent to medical and healthcare treatment from patients or their substitute consent providers. It incorporates the following changes:

- Amendments to the *Mental Health Act 2007* including the removal of concept of' primary carers' and the introduction of 'designated carers' and 'principal care providers'
- Amendments to the *Health Records and Information Privacy Act 2002* regarding the disclosure of genetic information to affected relatives
- Clarification that 'mature minors' can consent to or refuse their own treatment, and the circumstances where these decisions can be overridden
- Guidance for Health Practitioners when patients refuse recommended medical treatment in an obstetric setting
- Guidance for Health Practitioners when patients or their parents/guardians seek discharge against medical advice
- Additional information on electronic capture of consent
- Six new state wide consent forms.

The Consent manual is to be implemented by all NSW Health Agencies

327(30/03/20)

ADULT-TO-ADULT LIVING DONOR LIVER TRANSPLANTATION GUIDELINES (GL2008_019)

The purpose of the guideline is to provide guidance to health professionals and additional protection for prospective adult Living Donor Liver Transplantation (LDLT) donors. This guideline is aimed primarily at the jurisdictions that will endorse LDLT, the institutions that will provide LDLT, and the health professionals directly involved in this practice. To the extent that it is adopted by all jurisdictions in line with the particular requirements of their human tissue legislation, and applied in participating liver transplant units, it will promote ethical, lawful and consistent application of quality processes in provision of this complex procedure to donors, recipients and their families.

It should be read in conjunction with **PD2005_406**.

The document can be accessed at: http://www.health.nsw.gov.au/policies/gl/2008/GL2008_019.html

NOTIFICATION OF INFECTIOUS DISEASES UNDER THE *PUBLIC HEALTH ACT 2010* (IB2013_010)

IB2013_010 rescinds IB2012_011.

PURPOSE

Under the provisions of the *Public Health Act 2010* and the *Public Health Regulation 2012*, doctors, hospital chief executive officers (or general managers), pathology laboratories, directors of child care centres and school principals are required to notify certain medical conditions listed on the Ministry of Health website.

NOTIFICATION MECHANISMS

- Infectious disease notifications should be directed to the local Public Health Unit, and should be initiated as soon as possible within 24 hours of diagnosis.
- In order to protect patient confidentiality, notifications must not be made by facsimile machine except in exceptional circumstances and when confidentiality is ensured.
- Disease notification guidelines for notifiers are available at: **www.health.nsw.gov.au/Infectious/Pages/notification.aspx**

NOTIFICATION FORMS

Doctors and Hospitals

- Doctors and hospital chief executive officers (or general managers) must notify scheduled medical conditions and provide information specified in the **Doctor/Hospital Notification Form**, either by telephone or in writing. The notification can be found at: **http://www.health.nsw.gov.au/Infectious/Documents/doctor-hospital-notification-form.pdf**
- Notifications for AIDS must only include the first 2 letters of the patient's first and last names, and date of birth. Full name and addresses are not to be included.
- The **AIDS Notification Form** can be found at: **http://www.health.nsw.gov.au/Infectious/Documents/aids_notification_form.pdf**

Laboratories

- Laboratories must notify scheduled medical conditions and provide information specified in the **Laboratory Notification Form**, either by telephone or in writing.
- The laboratory notification form can be found at: **http://www.health.nsw.gov.au/Infectious/Documents/ph_labs2010b.pdf**
- Notifications for HIV infection should only include the first 2 letters of the patient's first and last names, and date of birth. Full name and addresses are not to be included.
- Laboratories carrying out confirmatory testing for HIV must notify infections directly to Communicable Diseases Branch. The **HIV notification form** can be found at: **http://www.health.nsw.gov.au/Infectious/Forms/hiv-notification-form.pdf**

NSW PERINATAL DATA COLLECTION (PDC) - REPORTING AND SUBMISSION REQUIREMENTS FROM 1 JANUARY 2016 (PD2015_025)

PD2015_025 rescinds PD2010_072.

PURPOSE

This Policy Directive is effective from 1 January 2016. It covers reporting and submission requirements for the Perinatal Data Collection (PDC), which is used for statewide surveillance to monitor patterns of pregnancy care, and maternal and newborn outcomes and to support national and state reporting obligations.

MANDATORY REQUIREMENTS

This policy applies to all midwives and doctors working in public and/or private facilities where a birth occurs. Reporting of all births in NSW to the PDC is a statutory requirement under the NSW *Public Health Act 2010*.

A PDC record must be completed for all births in NSW, including live born babies regardless of gestational age or birth weight, and stillborn babies of at least twenty (20) weeks gestation OR four hundred (400) grams birth weight. In the case of multiple births, a separate record must be completed in full for each baby.

From 1 January 2016 all records must be submitted in accordance with the timeframes described in section 1.3 of the following *Perinatal Data Collection (PDC) Reporting and Submission Requirements: Procedures*.

Section 3 of the following *Perinatal Data Collection (PDC) Reporting and Submission Requirements: Procedures* details the data items to be reported. Section 5 details the mandatory security requirements for data management.

IMPLEMENTATION

Chief Executives of LHDs and General Managers of Private Hospitals are to ensure:

- This policy directive is distributed to all staff involved in collecting and supplying data for the PDC. This includes staff of obstetric and neonatal units, medical record and information services staff.
- Staff have access to electronic systems able to collect the data items in accordance with Section 3 of the following *Perinatal Data Collection (PDC) Reporting and Submission Requirements: Procedures* by 1 January 2016.
- Data collected in accordance with the statutory requirement and this policy directive is submitted in compliance to the schedule provided in the form required for submission.

1. BACKGROUND

1.1 About this document

From 1 January 2016, this Policy Directive rescinds and replaces Policy Directive PD2010_072 concerning the NSW Perinatal Data Collection. This Policy Directive applies to reporting of births to the NSW Perinatal Data Collection (PDC) from 1 January 2016.

The Perinatal Data Collection (PDC) is used for statewide surveillance, monitoring patterns of pregnancy care, and maternal and newborn outcomes and to support national and state reporting obligations.

1.2 Key definitions

PDC records must be completed for **all births in NSW**, including live born babies regardless of gestational age or birth weight and stillborn babies of at least twenty (20) weeks gestation OR four hundred (400) grams birth weight. In the case of multiple births, a separate record must be completed in full for each baby.

1.3 Legal and legislative framework

Reporting of all births in NSW is a requirement of the NSW *Public Health Act 2010*. A record for each birth occurring within a Collection Period Quarter must be reported no later than three months after the close of the quarter, based on the date of birth of the baby. The following table lists the due dates for submission of PDC data:

Collection Period	Last Date for Data Submission in Collection Period	Deadline for Correction and Resubmission
Quarter 1 (1 Jan - 31 Mar)	30 June	11 August
Quarter 2 (1 Apr - 30 Jun)	30 September	11 November
Quarter 3 (1 Jul - 30 Sep)	31 December	11 February (following year)
Quarter 4 (1 Oct - 31 Dec)	31 March (the following year)	12 May

Any errors detected in submitted data are to be corrected and resubmitted **within 6 weeks of the date of final data submission**.

It should be noted that the table above shows the last acceptable date for initial data submission. Data may be supplied and accepted on a more frequent basis (eg weekly or monthly) to allow suppliers to obtain more timely feedback on the quality of births data that may better suit the operational processes of the supplier.

It is intended that the Collection Period and final date will be reduced in subsequent collection years and appropriate advice on the applicable Collection Periods will be published.

2. METHOD OF REPORTING

For births on or after 1 January 2016 PDC records must be submitted electronically in the form specified. The method of submission of PDC records is dependent on the type of collection/ submission entity as follows:

- Public Hospitals with maternity units are to submit records directly to EDWARD using a data extract from their maternity information system.
- Private Hospitals are to submit data to PeriPH. PeriPH will apply further processing prior to sending PDC records to EDWARD.
- Independent Midwives will submit data by direct data entry via a secure web-based form (PeriForm). This data, after processing, will be sent to EDWARD. Hospitals without maternity units will be able to utilise PeriForm to submit records for the individual births they manage.

EDWARD will hold the consolidated PDC data for births occurring on or after 1 January 2016.

While the required PDC data is constant, the receipt and processing platform will determine some differences in the extract format.

Paper forms will not be accepted or processed by the Ministry for any births on or after 1 January 2016.

3. DATA ITEMS TO BE REPORTED

3.1 Overview

This section lists the data that must be reported. Details of each of the items, including definitions, reportable values and guide for collection and use are provided in the PDC 2016 Data Dictionary.

As the data are submitted through different mechanisms and from different sources the requirements differ. The tables below specify the data to be reported by collection entity.

Y Required to be reported
n/a Not Applicable for the collection entity

3.2 Perinatal Data Provider

Item	Public Hospital	Private Hospital	Independent Midwife
Perinatal notifier identifier	Y	Y	Y
Perinatal notifier type code	Y	n/a	n/a

3.3 Mother Details

Item	Public Hospital	Private Hospital	Independent Midwife
Mother Client ID (medical record number or other defined identifier)	Y	Y	n/a
Given name	Y	Y	Y
Middle names	Y	Y	Y
Family name	Y	Y	Y
Full address of residence (including street number and name, locality, postcode and state/territory)	Y	Y	Y
Country of residence	Y	Y	Y
Country of birth	Y	Y	Y
Date of birth	Y	Y	Y
Indigenous status	Y	Y	Y

3.4 Newborn Details

Item	Public Hospital	Private Hospital	Independent Midwife
Newborn Client ID (medical record number or other defined identifier)	Y	Y	n/a
Given name	Y	Y	Y
Middle names	Y	Y	Y
Family name	Y	Y	Y
Indigenous status	Y	Y	Y
Baby birth date	Y	Y	Y
Baby birth status (livebirth/stillbirth)	Y	Y	Y
Sex	Y	Y	Y
Plurality	Y	Y	Y
Birth order	Y	Y	Y
Birth weight	Y	Y	Y
Estimated gestational age	Y	Y	Y
Apgar score at 1 and at 5 minutes	Y	Y	Y
Baby resuscitation type	Y	Y	Y

3.5 Pregnancy Details

Item	Public Hospital	Private Hospital	Independent Midwife
Previous pregnancy indicator	Y	Y	Y
Previous pregnancies count	Y	Y	Y
Last birth by caesarean section indicator	Y	Y	Y
Previous caesarean section count	Y	Y	Y
Mother's height (cm)	Y	Y	Y
Mother's weight (kg)	Y	Y	Y
Antenatal estimated date of birth	Y	Y	Y
Antenatal care received indicator	Y	Y	Y
Pregnancy duration at 1st antenatal care	Y	Y	Y
Number of antenatal visits (Antenatal service contact count)	Y	Y	Y
Mother tested for HIV Flag	Y	Y	Y
Mother immunised against pertussis in this pregnancy	Y	Y	Y
Mother immunised against influenza in this pregnancy	Y	Y	Y
Mother diabetes type	Y	Y	Y
Mother chronic hypertension flag	Y	Y	Y
Mother preeclampsia flag	Y	Y	Y
Mother gestational hypertension	Y	Y	Y
Mother eclampsia flag	Y	Y	Y
Hepatitis B surface antigen positive	Y	Y	Y
Smoking in first half of pregnancy	Y	Y	Y
Average number of daily cigarettes smoked in first half of pregnancy	Y	Y	Y
Smoking in second half of pregnancy	Y	Y	Y
Average number of daily cigarettes smoked in second half of pregnancy	Y	Y	Y
Quit smoking in this pregnancy	Y	Y	Y
If quit smoking in this pregnancy, at what gestation week?	Y	Y	Y

3.6 Labour and Delivery

Item	Public Hospital	Private Hospital	Independent Midwife
Labour onset type	Y	Y	Y
Labour induced with oxytocins	Y	Y	Y
Labour induced with prostaglandins	Y	Y	Y
Labour induced by artificial rupture of membranes	Y	Y	Y
Labour induced by other means	Y	Y	Y
Main indication for induction of labour	Y	Y	Y
Labour augmented with oxytocins	Y	Y	Y
Labour augmented by artificial rupture of membranes	Y	Y	Y
Presentation at birth	Y	Y	Y
Analgesia provided in labour – various types	Y	Y	Y
Type of birth	Y	Y	Y
Main indication for caesarean section	Y	Y	Y
Anaesthesia provided during delivery – various types	Y	Y	Y
Perineal status	Y	Y	Y
Episiotomy indicator	Y	Y	Y
Surgical repair of the vagina or perineum	Y	Y	Y
Management type applied in 3rd stage	Y	Y	Y

3.7 Maternity Care

Item	Public Hospital	Private Hospital	Independent Midwife
Model of care during pregnancy	Y	Y	Y
Model of care at birth	Y	Y	Y
Place of birth	Y	Y	Y

3.8 Postnatal Care

Item	Public Hospital	Private Hospital	Independent Midwife
Postpartum haemorrhage within 24 hours of birth	Y	Y	Y
Postpartum haemorrhage within 24 hours of birth requiring blood transfusion	Y	Y	Y
Postpartum haemorrhage within 24 hours of birth – estimated blood loss	Y	Y	Y
Congenital condition present flag	Y	Y	Y
Congenital condition(s) description	Y	Y	Y
Newborn hepatitis B birth dose	Y	Y	Y

3.9 Discharge status of mother and baby

Item	Public Hospital	Private Hospital	Independent Midwife
Discharge status of mother	Y	Y	Y
Mother's date/time of discharge or transfer	Y	Y	Y
Hospital mother transferred to	Y	Y	Y
Discharge status of baby	Y	Y	Y
Baby's date/time of discharge or transfer	Y	Y	Y
Hospital baby was transferred to	Y	Y	Y
Baby feeding on discharge (various)	Y	Y	Y

3.10 System and Service event details

Item	Public Hospital	Private Hospital	Independent Midwife
Mother client identifier – issuing authority	Y	n/a	n/a
Mother client identifier type code	Y	n/a	n/a
Mother service encounter record identifier	Y	n/a	n/a
Mother service event record identifier	Y	n/a	n/a
Mother service event source identifier	Y	n/a	n/a
Mother service event type code	Y	n/a	n/a
Newborn client identifier – issuing authority	Y	n/a	n/a
Newborn client identifier type code	Y	n/a	n/a
Newborn service encounter record identifier	Y	n/a	n/a
Newborn service event record identifier	Y	n/a	n/a
Newborn service event source identifier	Y	n/a	n/a
Newborn service event type code	Y	n/a	n/a
Perinatal birth record identifier	Y	Y	n/a
Perinatal pregnancy record identifier	Y	Y	n/a
Perinatal record source identifier	Y	n/a	n/a
Source create date and time	Y	n/a	n/a
Source modified date and time	Y	n/a	n/a
Perinatal record action type	Y	Y	n/a

4. DATA QUALITY

Data quality checks are made to ensure that all data submitted is compliant with the PDC as specified by the PDC 2016 Data Dictionary. Checks are made as the data is submitted to PeriPH or EDWARD or entered via PeriForm.

Incomplete records or records with errors will be identified and an error report made available to the submitting hospital. These records must be corrected and re-submitted by the reporting entity within the time stipulated (i.e. within 6 weeks of the date of final data submission).

In order to validate the enumeration of births for each calendar year a list of reported births are sent to each hospital and is to be validated against the hospital birth register.

5. SECURITY OF DATA

The Privacy Manual for Health Information (March 2015) and the Privacy Management Plan (Policy Directive PD2015_036) must be observed for all data relating to the PDC.

Public hospitals with maternity units will submit data to EDWARD from behind the electronic security framework of NSW Health. Files must be directed to the location specified in the EDWARD Perinatal Interface Documentation (refer to supporting documents).

Private hospital users require an authorised user account to access and submit data to PeriPH.

Independent midwives (and users from hospitals without maternity units) require an authorised user account to access and submit data via the secure online PeriForm.

To apply for authorised access to PeriPH and PeriForm contact the Data Integrity Officer in Health Systems Information and Performance Reporting Branch, NSW Ministry of Health.

6. PDC INFORMATION – ACCESS AND DISSEMINATION

Information collected by the PDC is used for the following purposes:

- State wide surveillance to monitor patterns of care for mothers and babies, and outcomes of care. Summary information for NSW is published annually on HealthStats NSW at: http://www.healthstats.nsw.gov.au/
- Planning, monitoring and evaluation of maternity services by the Ministry of Health and Local Health Districts.
- De-identified unit record data are provided to the AIHW National Perinatal Statistics Unit for inclusion in the National Perinatal Data Collection.
- De-identified data and summary data are provided to the NSW Ombudsman to support the work of the NSW Child Death Review Team.
- Research purposes with the approval of a human research ethics committee.

PDC data may be accessed in the following ways:

- De-identified unit record data may be obtained via Secure Analytics for Population Health Research and Intelligence (SAPHaRI), which is the NSW Ministry of Health population health data warehouse, analysis and reporting system. SAPHaRI is administered by the Centre for Epidemiology and Evidence, and is accessible by staff of the NSW Ministry of Health and public health services subject to signing of a confidentiality agreement.
- Access to de-identified PDC unit record data for research purposes may also be sought by written request to the Executive Director, Centre for Epidemiology and Research.

7. GLOSSARY

Term/Acronym	Definition
AIHW	Australian Institute of Health and Welfare
EDWARD	NSW Health's Enterprise Data Warehouse for Analysis, Reporting and Decision Support.
PDC	Perinatal Data Collection
PeriForm	A secure online form to allow the entry and submission of individual PDC records
PeriPH	The application and data base to be used by private facilities for the submission and data quality checks for PDC records

8. FURTHER INFORMATION

Detailed information on the PDC data items, codes and guidance on completion of each data item is contained in the *New South Wales Perinatal Data Collection Data Dictionary 2016.*

Further information concerning the collection and submission of PDC data is available on the NSW Health Intranet from the following URL:

http://internal.health.nsw.gov.au/data/collections/pdc/index.html

Including links to the following resources:

- Data Dictionary – EDWARD Data Stream – Perinatal Notification
- Perinatal Data Collection Classification Changes Effective From 1 January 2016 Information Bulletin
- EDWARD Interface Requirements Specification for File Based Extracts – Perinatal Notification Data Stream
- Data Dictionary EDWARD Control and Audit Data Dictionary (excluding data error concepts)
- PeriPH data submission format specification

- Perinatal Data Set Specification 2015-16 (AIHW; Nov., 2014; http://meteor.aihw.gov.au/content/index.phtml/itemId/581388)
- Perinatal NMDS 2014- (AIHW; March, 2014; http://meteor.aihw.gov.au/content/index.phtml/itemId/517456).

NSW REGISTER OF CONGENITAL CONDITIONS – REPORTING REQUIREMENTS (PD2018_006)

PD2018_006 rescinds PD2012_055

PURPOSE

This Policy Directive provides guidance to NSW Health staff on the procedure to be followed for the reporting of congenital conditions to the NSW Register of Congenital Conditions.

MANDATORY REQUIREMENTS

All hospitals must notify the Register of Congenital Conditions (the Register) of scheduled congenital conditions detected in a fetus during pregnancy or in a child up to one year of age. This includes staff of obstetrics, neonatal and paediatric units, prenatal genetic services for chromosomal and DNA testing, feto-maternal units and anatomical pathology departments.

This Policy Directive outlines the process for submitting paper and electronic notifications to the Ministry of Health, and presents information on data quality, security, access and dissemination. Compliance with this directive is mandatory for NSW Health and is a condition of subsidy for public health organisations.

IMPLEMENTATION

This Policy Directive should be distributed to all LHD staff. Staff involved in the identification of scheduled congenital conditions during pregnancy or the post-natal period must follow the procedure set out in this policy directive.

BACKGROUND

About this document

All hospitals must notify the Register of Congenital Conditions (the Register) of scheduled congenital conditions detected in a fetus during pregnancy or in a child up to one year of age. This includes staff of obstetrics, neonatal and paediatric units, prenatal genetic services for chromosomal and DNA testing, feto-maternal units and anatomical pathology departments.

The Register is located in the Centre for Epidemiology and Evidence of the NSW Ministry of Health. Information from the Register is used to monitor the occurrence of congenital conditions for service planning purposes and to identify changes in incidence that may warrant investigation.

Key definitions for scheduled congenital conditions

The Register is a state wide surveillance system that monitors the occurrence of scheduled congenital conditions to plan services for affected families, and identify changes in incidence that may warrant investigation.

Scheduled congenital conditions include:

1. All structural malformations. Examples include spina bifida, microcephaly, transposition of the great vessels, ventricular septal defects, pulmonary agenesis, polycystic lungs, duodenal atresia, exomphalos, hypospadias, cleft lip/palate, microphthalmia, limb reductions, polydactyly, birthmarks greater than 4cm diameter, cystic hygroma and multisystem syndromes including at least one structural malformation.
2. Chromosomal abnormalities. Examples include Down syndrome and unbalanced translocations.
3. Four medical conditions: cystic fibrosis, phenylketonuria, congenital hypothyroidism and thalassaemia major.

Congenital conditions that are not notifiable include:

1. Minor anomalies occurring in isolation.

   Examples of minor anomalies include skin tags, deviated nasal septum, tongue tie, benign heart murmurs, clicky non-dislocating hips, sacral dimples, positional talipes, abnormal palmar creases, and dysmorphic features.

2. Birth injuries.
3. Congenital infections which do not result in a structural malformation.
4. Tumours and cysts.
5. Conditions arising from prematurity or asphyxiation.

Legal and legislative framework

Congenital conditions occurring in a child under one year of age or pregnancies where the fetus has a congenital condition are required to be reported under the NSW Public Health Act 2010.

REPORTING METHOD

Notification types

1. *Notification of a scheduled congenital condition diagnosed in an infant*
   Information in this format should be supplied for congenital conditions detected in stillborn babies or live born babies up to one year of age.
2. *Notification of a scheduled congenital condition diagnosed by prenatal diagnosis*
   Information in this format should be supplied for congenital conditions detected in the fetus during pregnancy, regardless of whether the pregnancy continues.

Guidelines for notification are printed on the outside cover of each notification pad.

In the case of a multiple pregnancy or multiple birth where both babies are affected, a separate form or electronic record must be completed in full for each fetus or baby.

Methods of notification

Information may be supplied in paper or electronic format.

Paper notifications

For submission on paper forms, forms are provided in triplicate with the original sent to the NSW Ministry of Health, one copy for the hospital medical record and one copy for the parent or family. Information for parents and families concerning the Register is printed on the reverse side of the Parent Copy of both notification forms.

Paper notifications should be mailed to:

The NSW Register of Congenital Conditions
Centre for Epidemiology and Evidence
Level 7
NSW Ministry of Health
Locked Mail Bag 961
North Sydney NSW 2059

Electronic notifications

Electronic notifications of scheduled congenital conditions can be facilitated via a hospital's Maternity Information System – the electronic system that captures birth notifications from hospitals. Notifications should be entered immediately following diagnosis. Notifications should be sent to the Ministry of Health on at least a quarterly basis. For facilities interested in submitting notifications electronically, please contact: roccadmin@moh.health.nsw.gov.au.

Information to be notified

Demographic details (mother)
First name
Last name
Date of birth
Hospital medical record number or laboratory number
Residential address
Country of birth
Indigenous status (mother)

Demographic details (live born or stillborn baby)
First name
Last name
Date of birth
Hospital medical record number or laboratory number
Hospital of birth
Sex
Indigenous status (baby)
Plurality
Baby number
Birth weight
Gestation
Outcome
Autopsy/histopathology
Date of death

Pregnancy details (where applicable)
Indication for prenatal diagnosis
Type of prenatal diagnosis
Date of last menstrual period
Relevant medical or family history
Congenital abnormality/syndrome
Diagnosis
Laterality
Date of Diagnosis
Karyotype – balanced, unbalanced

DATA QUALITY

Data submitted to the Register is checked for any discrepancies and further information is requested from the hospital or reporting clinician if information received is inconsistent or incomplete.

DATA SECURITY

Data collected by the Register is protected under the NSW Public Health Act 2010.
The NSW Health Privacy Manual for Health Information (previously known as the NSW Health Privacy Manual) must be observed for all data relating to the Register. This is located at:
http://www.health.nsw.gov.au/policies/manuals/Pages/privacy-manual-for-health-information.aspx.

The Register database is held on the NSW Ministry of Health's local area network, is password protected and is accessible only to the Register staff.
Paper forms submitted to the Register are securely stored and are destroyed no more than five years after the year of birth or completion of the pregnancy.
Personal identifiers (name, residential street number and name, and medical record number) are removed from the database five years after the year of birth or completion of the pregnancy.

DATA ACCESS AND DISSEMINATION

Information obtained from the Register is made available on request. Specific analyses of Register data, or access to unit record data from the Register, may be obtained on written request to the Executive Director, Centre for Epidemiology and Evidence (email: ceemail@moh.health.nsw.gov.au).

CONTACT INFORMATION

For further information about the Register of Congenital Conditions, or this Policy Directive, please contact: roccadmin@moh.health.nsw.gov.au.

NOTIFYING CANCER-RELATED DATA TO THE NSW CANCER REGISTRY (PD2022_008)

PD2022_008 rescinds PD2009_012

POLICY STATEMENT

NSW Health is committed to reducing the burden of cancer in the NSW population and will do this by continuing to capture cancer-related data into the NSW Cancer Registry.

The data captured will be used to report on incidence and mortality from cancer and support programs that utilise the data to reduce incidence and improve outcomes for people diagnosed and treated for cancer.

SUMMARY OF POLICY REQUIREMENTS

This Policy Directive outlines the requirements for submitting notifications to the NSW Cancer Registry and presents information on data quality, security, access, and dissemination.

Under the provisions of the Public Health Act 2010 and the Public Health Regulation 2012, public and private sector admitted and non-admitted patient facilities, and pathology laboratories are required to notify the NSW Cancer Registry of all cancer cases.

Under these same provisions, the registrar of births, deaths, and marriages is required to notify the NSW Cancer Registry of deaths due to cancer.

The provisions of the Cancer Institute (NSW) Act 2003 also allow for the NSW Cancer Registry to request and collect clinical data relating to cancer treatment from any facility providing care to cancer patients in NSW.

All data submitted to the NSW Cancer Registry undergo a series of quality checks and validations. If data quality issues are detected that require resolution at the source, an error report is generated and sent to the notifier.

The procedures outlined in the NSW Health privacy manual for health information and the Cancer Institute NSW Data Governance Policy are adhered to by NSW Cancer Registry staff in order to ensure that appropriate data security and governance safeguards are in place.

Data held within the NSW Cancer Registry can be used to support the functions of the Cancer Institute NSW:

- Monitor and record the number of new cases of notifiable cancers and deaths due to notifiable cancers in NSW;
- Produce regular and ad hoc reports on cancer incidence, treatment patterns, mortality, and survival;
- Evaluate the effectiveness of cancer screening programs;
- Assist in planning and monitoring services for cancer control and the care of cancer patients;
- Contribute cancer data to national and international agencies to assist in cancer
- control.

- Review adherence to best practice guidelines and optimal care pathways
- Assist in development and implementation of culturally safe cancer care for Aboriginal people across the optimal care pathways
- Review treatment outcomes of standards of care and also review clinical trial outcomes when transitioned into best practice care for a wider cohort.
- Inform reporting which supports quality improvements in cancer care.

Notifying Cancer-Related Data to the NSW Cancer Registry: Procedures

1 BACKGROUND

1.1 About this document

Under the provisions of the Public Health Act 2010 and the Public Health Regulation 2012, public and private sector admitted and non-admitted patient facilities, and pathology laboratories are required to notify the NSW Cancer Registry of all cancer cases.

Under these same provisions, the registrar of births, deaths, and marriages is required to notify the NSW Cancer Registry of deaths due to cancer.

The provisions of the Cancer Institute (NSW) Act 2003 also allow for the NSW Cancer Registry to request and collect clinical data relating to cancer treatment from any facility providing care to cancer patients in NSW.

1.2 Key definitions

Aboriginal person

An ‘Aboriginal person’ is a person who:

- is of Aboriginal descent
- identifies as an Aboriginal person and
- is accepted as an Aboriginal person by the community in which they live.

Active treatment

A clinical treatment intervention for a specific cancer at a single point in time where the cancer is the principal or an additional diagnosis for the episode of care. Active treatment refers to those under acute or palliative care.

Admitted patient

A person provided a health care service by a hospital, day procedure centre or multipurpose service on an admitted patient basis.

Cancer

Cancer is a Category 3 Scheduled medical condition and is also a notifiable disease under Schedule 2 of the Public Health Act 2010. This document provides guidance regarding the procedures to be followed for the reporting of cancer-related data to the NSW Cancer Registry.

Data custodian

The data custodian is incumbent to the position responsible for day-to-day management and oversight of the data asset, approval of access to data, and the overall quality and security of the data asset.

Non-admitted patient

A person provided a health care service by a hospital, day procedure centre or multipurpose service on a non-admitted patient basis.

Notifiable diseases

A medical condition listed under Schedule 2 of the Public Health Act 2010 (NSW)

Palliative treatment

Treatment aimed at providing pain and symptom relief in order to improve the patient's quality of life

Pathology laboratory

A Pathology Laboratory is a Laboratory where tests are carried out on clinical specimens to obtain information about the health of a patient to aid in diagnosis, treatment, and prevention of disease.

Note: In NSW pathology laboratories include services provided by Pathology NSW, Institute of Forensic Medicine, NSW private sector pathology services providers and interstate pathology laboratories.

Radiology services

Any accredited premises in which radiology services are provided within NSW to diagnose or stage a notifiable cancer or response to cancer treatment, or where interventional radiology treatments for cancer are provided.

Scheduled condition

A medical condition listed under Schedule 1 of the Public Health Act 2010 (NSW).

Tabulated data

Summary data produced from analyses of unit record data using broad categories (e.g. age group) and presented in a way that it is not possible to identify any individual.

Unit record data

Data relating to an individual person, which may be presented in an identified (containing identifying information such as name and address) or re-identifiable (identifying information removed) format

1.3 Legal and legislative framework

The Public Health Act 2010, Public Health Regulation 2012, and Cancer Institute (NSW) Act 2003 give authority to the Policy Directive relating to the collection of cancer-related data and the NSW Cancer Registry.

The Public Health Act 2010 outlines the mandatory requirement to notify cancer cases and cancer-related deaths to the NSW Cancer Registry and describes the penalties for non-compliance. The Cancer Institute (NSW) Act 2003 allows for clinical data relating to cancer treatment to be provided to the NSW Cancer Registry.

The Health Records and Information Privacy Act 2002 outlines the requirements for managing health information, including data collection, storage, use, disclosure, and retention.

The NSW Health Privacy Manual for Health Information provides information to these legislative obligations and outlines procedures to support compliance.

1.4 The NSW Cancer Registry

The NSW Cancer Registry, formerly known as the NSW Central Cancer Registry, is a population-based, central repository of data relating to cases of notifiable cancers, deaths due to notifiable cancers, and clinical treatment data for residents of NSW.
Data is also held in the NSW Cancer Registry for residents of other Australian states and territories who were diagnosed or treated for cancer in NSW. The NSW Cancer Registry also processes all notifications received for the ACT cancer registry.

The Cancer Institute NSW acts as the manager of the NSW Cancer Registry and custodian of the data held within the NSW Cancer Registry on behalf of the Secretary of the NSW Ministry of Health.

1.5 Aboriginal and Torres Strait Islanders

NSW Health Policy Directive *Aboriginal and Torres Strait Islander Origin – Recording of Information of Patients and Clients* (PD2012_042) outlines the requirements for collecting and recording accurate information on whether clients of NSW Health services are Aboriginal and/or Torres Strait Islander.

Aboriginal and Torres Strait Islander people are under-reported in many health-related data collections in NSW. Self-report in response to the standard Australian Bureau of Statistics question about a person's Aboriginality is the most accurate means of ascertaining whether a client is Aboriginal and/or Torres Strait islander.

The standard question must be asked of all clients of NSW Health services, and the information needs to be recorded accurately according to national standards.

2 MANDATED NOTIFIERS

Sections 82 and 83 of the Public Health Act requires hospital Chief Executive Officers and medical practitioners to notify each case of cancer if they work for certain health entities including:

- Public hospitals within the meaning of the Health Services Act 1997
- Private health facilities, within the meaning of the Private Health Facilities Act 2007
- Any other types of institutions declared by the Public Health Act regulations to be a hospital.

Section 55 of the Public Health Act requires pathology laboratories to notify each case of cancer where the result for a pathology test for cancer, carried out at the request of health practitioner, is positive.

To meet the cancer notification requirements, the notification must be sent to the NSW Cancer Registry either via the NSW Health data warehouse (public hospitals only), or via direct submission in the prescribed format to the NSW Cancer Registry.

3 REPORTING METHODS

3.1 Incidence Cancer cases

Sections 55 and 83 of the Public Health Act 2010 and the Public Health Regulation 2012 requires chief executives of hospitals and laboratories operated by public sector or the private sector within NSW to notify each case of cancer to the NSW Cancer Registry. A separate notification is required for each primary site of cancer.

Lists of notifiable cancers and exclusion criteria can be found in Appendix 1 and 2.

3.1.1 Hospitals

For admitted patients, a cancer notification must be reported at each episode of care where a notifiable cancer is the principal or additional diagnosis and/or where active or palliative treatment has been provided. These notifications are to be provided within 6 weeks of the admission date.

For non-admitted patients, a cancer notification must be reported following a consultation where a diagnosis of a notifiable cancer is first diagnosed and notated in the patient's medical record and following the start of each course of treatment.

Complete and accurate notifications must be reported within 12 weeks of the consultation or course of treatment start date.
An episode of care refers to an admission, or a treatment sequence from commencement to completion (Course).

The data items to be provided may include, but are not limited to:	
Demographics	name, sex, address, date of birth, country of birth, Aboriginality status
Episode of care	facility ID, AMO/AHPRA registration number of treating clinician, admission date, separation date, status at separation
Diagnostic information	date of diagnosis, primary site, morphology, best basis of diagnosis

For an up-to-date list of notification data items please refer to the *current notification specification.*
NSW health public hospitals, multi-purpose services and affiliated health organisations are required to report cancer notifications through the NSW Health data warehouse via the admitted patient data collection extract formats, or the non-admitted patient and supplementary services data collection extract format.

The data extract requirements for reporting through the NSW data warehouse are issued by the Ministry of Health systems information and analytics branch. Requests for information can be sent to: MOH-SIA-HIE@health.nsw.gov.au

Where reporting cancer notifications via the NSW Health data warehouse has not been established cancer notifications must be submitted via data extracts sent directly to the NSW Cancer Registry. The extract requirements for these direct submissions are issued by the Cancer Institute NSW. Submissions must be made via the cancer notification portal.

Private sector hospitals must report cancer notifications directly to the NSW Cancer Registry either via the batch data extract format, or as individual notifications. These submissions must be made via the cancer notification portal..

3.1.2 Pathology laboratories

Public and private sector operated pathology laboratories are required to notify all cases reported as cancer, as well as benign and uncertain-behaviour neoplasms of the central nervous system, to the NSW Cancer Registry.

A pathology report with a confirmed diagnosis of cancer is regarded as the definitive source for determining a cancer case for NSW Cancer Registry. These notifications are to be provided within 6 weeks of the pathology collection date.

Pathology reports for the diagnosis of notifiable cancers may come from histopathology, cytology, cytogenetics, haematology, or molecular diagnostic tests.

The following qualifiers used in pathology reports are regarded as acceptable for a diagnosis of cancer:		
consistent with	compatible with	comparable with
diagnostic of	equivalent to/of	extension into
in keeping with	indicative of	invasion of
supports a diagnosis of	(the features) are those of	typical of

Pathology laboratories must provide a copy of each complete and final pathology report that confirms the diagnosis of a notifiable cancer or contributes to the staging or grading of a cancer and associated prognostic factors to the NSW Cancer Registry.

Supplementary reports detailing the results of additional tests and expert reviews, must also be provided, especially when the diagnosis has been revised to a benign condition.

Pathology laboratories can provide notifications in hard copy (paper format) or soft copy (Electronic Pathology Solution). Hard copy reports must be marked “Private and Confidential” and can be sent to the mailing address provided in Section 5.

3.2 Cancer deaths

Under the provisions of the Public Health Act 2010 and the Public Health Regulation 2012, the NSW Registrar of Births, Deaths, and Marriages is required to notify the NSW Cancer Registry of deaths due to notifiable cancers and the department of forensic medicine where cancer was an incidental finding at post-mortem. These notifications are to be provided within 6 weeks of the date of death or final determination of the cause of death.

The Australian Bureau of Statistics manages the collation of coded cause of death data from state and territory registrars and the National Coronial Information Service and the consolidated data are sought from the Australian Coordinating Registry (ACR) and provided to the NSW Cancer Registry.

Cancer death data and coded cause of death data are provided to the NSW Cancer Registry via encrypted electronic notification files. Aboriginal status must be recorded.

Lists of notifiable cancers and exclusion criteria can be found in Appendix 1 and 2.

3.3 Clinical data

The provisions within the Cancer Institute (NSW) Act 2003 allow the NSW Cancer Registry to request clinical data relating to cancer treatment from any facility providing treatment for cancers in NSW, including private sector health organisations.

The data that must be reported describes the clinical aspects treatments provided to patients with a notifiable cancer. The treatments include radiotherapy, systemic therapies, interventional radiology and other day procedures which aim to remove, control or prepare the cancer for further treatments, or to treat recurrent and metastatic disease.

Clinical data can be provided via extracts from electronic medical record systems used by oncology services or centralised data repositories, via electronic secure data transfer in the form prescribed by the Cancer Institute NSW. Clinical data must be reported within 12 weeks of treatment completion or cancellation, with a minimum frequency of quarterly supply.

Requests for the data extract format requirement specifications for each type of treatment, and details about the data submission process for clinical cancer treatment data, must be sent to CINSW- ClinicalData@health.nsw.gov.au.

4 DATA QUALITY

4.1 Errors

Staff at notifying facilities are to review notifications prior to submission and address any errors detected in source systems where possible.

All data submitted to the NSW Cancer Registry via any of the reporting mechanisms undergo a series of quality checks and validations. If data quality issues are detected that require resolution at the source, an error report is generated and sent to the notifier.

These error reports are to be checked and corrections made by the notifier within 10 working days.

4.2 Requests for further information

Where a notification is received for an equivocal or unconfirmed cancer diagnosis, further information may be requested before the case is registered. In these instances, the NSW Cancer Registry may contact the notifier, or any medical practitioner involved in the treatment of the person concerned to obtain clarification of test results or the results of any additional tests performed, as well as other information concerning the person's medical condition, transmission and risk factors.

It is a requirement that clarification or further information is provided upon request to NSW Cancer Registry staff. Responses to requests for further information are required within 10 working days.

5 DATA STORAGE AND SECURITY

NSW Cancer Registry data are stored on secure servers located on eHealth's infrastructure hosted in the GovDC with access restricted to authorised personnel only.

The procedures outlined in the NSW Health privacy manual for health information and the Cancer Institute NSW Data Governance Policy are adhered to by NSW Cancer Registry staff in order to ensure that appropriate data security and governance safeguards are in place.

6 DATA ACCESS AND DISSEMINATION

Data held within the NSW Cancer Registry can be used to support the functions of the Cancer Institute NSW:

- Monitor and record the number of new cases of notifiable cancers and deaths due to notifiable cancers in NSW;
- Produce regular and ad hoc reports on cancer incidence, treatment patterns, mortality, and survival;
- Evaluate the effectiveness of cancer screening programs;
- Assist in planning and monitoring services for cancer control and the care of cancer patients;

- Contribute cancer data to national and international agencies to assist in cancer control.
- Review adherence to best practice guidelines and optimal care pathways
- Assist in development and implementation of culturally safe cancer care for Aboriginal people across the optimal care pathways
- Review treatment outcomes of standards of care and also review clinical trial outcomes when transitioned into best practice care for a wider cohort.
- Inform reporting which supports quality improvements in cancer care.

Tabulated data from the NSW Cancer Registry can be made available upon request and may require approval from the data custodian.

Unit record data held within the NSW Cancer Registry can be utilised for epidemiological research upon approval from the data custodian, NSW population and health services research ethics committee, and the NSW Ministry of Health. Depending on the research question and data requested, additional ethics approvals may be required.

Further information on data access and the approvals required can be found at Cancer Institute NSW website.

7 CONTACT INFORMATION

Requests for further information about the mandatory reporting requirements of the NSW Cancer Registry must be directed to the cancer notifications manager, NSW Cancer Registry.

Requests for further information about the provision of clinical data related to cancer treatment must be directed to the manager, registries and data collection.

Contact details for the NSW Cancer Registry are provided below:	
Physical address	Cancer Institute NSW Level 4, 1 Reserve Road St Leonards NSW 2065
Secure postal address	Locked Bag 2011 St Leonards NSW 1590 Must be marked: “Private and Confidential”

APPENDIX LIST

1. List of notifiable cancers
2. Cancers to be excluded from notifications

APPENDIX LIST

Appendix 1: List of notifiable cancers

Description	ICD-10-AM 11th Edition [11]	
	Topography	Morphology
Human immunodeficiency virus (HIV) disease resulting in malignant neoplasms[2]	B21	Ending with /3
All cases of invasive cancer except those specified in Appendix 2 All cases of unequivocally malignant conditions (haematological[3])	C00.0 to C97 D45-47	Ending with /3
Benign, uncertain-behaviour and malignant neoplasms of the central nervous system	C70.0–C72.9 and C75.1–C75.3	
Squamous cell carcinoma of the vermillion surface and border of the lip	C00	M805X/3 to M808X/3
Squamous cell carcinoma of skin of anus	C44.5 ([4])	M805X/3 to M808X/3
Squamous cell carcinoma of skin of vulva	C51.9	M805X/3 to M808X/3
Squamous cell carcinoma of skin of penis	C60.9	M805X/3 to M808X/3
Squamous cell carcinoma of skin of scrotum	C63.2	M805X/3 to M808X/3
Carcinoma in-situ of bronchus and lung	D02.2	Ending with /2
Melanoma in-situ	D03	Ending with /2
Carcinoma in-situ of breast	D05	Ending with /2
Carcinoma in-situ of bladder	D09	Ending with /2

Notes:

1. ICD-10-AM codes taken from the International Statistical Classification of Diseases and Related Health Problems, 11th Revision, Australian Modification (11th Edition, 31/05/2019), published by the National Centre for Classification in Health: https://sydney.edu.au/health-sciences/ncch/
2. When notifying a Topography= B21, the topography of the primary site of the cancer arising from HIV disease must also be notified.
3. Diseases with ICD-10-AM commencing with 'D' and 'L' were reclassified in ICD-O-3 with a malignant morphology code. Despite being classified under 'Neoplasms of uncertain or unknown behaviour' in ICD-10-AM, these diseases are notifiable when paired with the corresponding morphology codes in this table. The NSW Cancer Registry commenced collection of these notifications for cases diagnosed from 2003 onwards. Cases diagnosed prior to 2003 may also be notified, and if the exact date of diagnosis is unknown a default date of 01/01/2001 should be reported.
4. C44.5 with morphology M805X/3 to M808X/3 also covers squamous cell carcinomas of skin sites other than the anus, which are not notifiable.

Appendix 2: Cancers to be excluded from notifications

Description	Topography	Morphology	Exception
In-situ cancers and intraepithelial neoplasia with no mention of invasion	C00.0 to C97	Ending with /2	Carcinoma in-situ of bronchus and lung (D02.2); Melanoma in-situ (D03.0 to D03.9); Carcinoma in-situ of breast (D05.0 to D05.9). Carcinoma in-situ of bladder (D09*)
Benign and uncertain behaviour tumours			Benign, uncertain-behaviour neoplasms of the central nervous system (topography codes C70.0–C72.9 and C75.1–C75.3)
Basal cell carcinomas of the skin	C44*	M8090/3	
Squamous cell carcinomas of the skin	C44*	M805X/3 to M808X/3	Vermilion surface and border of lip (C00.0 to C00.9); Anus (C44.5); Vulva (C51.9); Penis (C60.9); Scrotum (C63.2).
Pre-cancerous conditions.			
Cases where there is an unclear or equivocal diagnosis of cancer and a definitive diagnosis has not been made radiologically, cytologically, or histologically; and the clinician does not regard the patient as having cancer.			

CHILD WELLBEING AND CHILD PROTECTION POLICIES AND PROCEDURES FOR NSW HEALTH (PD2013_007)

PD2013_007 rescinds PD2005_299, PD2006_104, PD2007_023, PD2011_057, PD2011_065, GL2011_008, IB2010_005 & IB2012_002.

PURPOSE

This policy articulates the professional and legal responsibilities of all health workers to promote the health, safety, welfare and well-being of children and young people, working collaboratively with interagency partners in the shared system of child protection in NSW. These responsibilities apply whether workers are providing health care directly to children and young people or to adult clients who are parents/carers or are pregnant.

This policy informs Local Health Districts, Specialty Health Networks, other health services and health workers about the tools and resources available and the interagency arrangements in place to assist them to meet their responsibilities and provide a consistent NSW Health response to child protection and wellbeing.

MANDATORY REQUIREMENTS

Every health worker has a responsibility to protect the health, safety, welfare and wellbeing of children or young people with whom they have contact.

The legal responsibilities of health services and health workers are identified in the following legislation:

Children and Young Persons (Care and Protection) Act 1998

- Collaborate with interagency partners and comply with information exchange provisions to promote the safety, welfare and wellbeing of children and young people, including taking reasonable steps to coordinate the provision of services with other agencies;
- Meet requirements for mandatory reporting of children and reporting of young people (or classes/groups of children or young people) at suspected risk of significant harm (ROSH);
- Report unborn children where it is suspected they may be at ROSH after their birth;
- Respond to the needs of children and young people after making a report to Community Services or to the NSW Health Child Wellbeing Unit;
- Respond to Community Services' and Children's Court requests to provide health services and or Community Services and Police Force requests to provide medical examinations and treatment;
- Assist with Children's Court proceedings when required.

Commission for Children and Young People Act 1998*/*Child Protection (Working with Children) Act 2012

- Meet requirements to ensure that only people with valid Working with Children Checks are engaged in child related work (where a child is under the age of 18 years).

Ombudsman Act 1974

- Maintain systems to prevent '**reportable conduct**' by health workers and for reporting and responding to alleged reportable conduct involving NSW Health employees.

The policy responsibilities of health workers are to:

- Recognise and respond appropriately to the vulnerabilities, risks and needs of families, children and young people when providing any health service;
- Collaborate across NSW Health services and with interagency partners to support and strengthen families and promote child health, safety, welfare and wellbeing;
- Use the **Mandatory Reporter Guide** and seek assistance from the NSW **Health Child Wellbeing Unit** to help identify children or young people at suspected risk of significant harm (ROSH);
- Seek assistance from the **NSW Health Child Wellbeing Unit** and the **Family Referral Services** to help respond to vulnerable families, children and young people below the ROSH threshold;
- Actively seek feedback from Community Services after making a child protection report and continue to support the child, young person or family consistent with the health worker's roles and responsibilities;
- Follow the **Child Wellbeing and Child Protection - NSW Interagency Guidelines** and other agreed interagency procedures when working with children, young people and families, including in relation to information exchange, High Risk Birth Alerts, Prenatal Reporting, escalation of child protection concerns, assumption of care by Community Services and out of home care health assessments;
- Collaborate in joint investigation and response to matters involving alleged child sexual assault or serious child abuse or neglect leading to criminal proceedings; and
- Participate in mandatory and/or other child protection training for NSW Health workers.

IMPLEMENTATION

Chief Executives across the NSW public health system are responsible and accountable for:

1. Ensuring that this policy and the associated *Child Wellbeing and Child Protection Fact Sheet for NSW Health Workers* are understood and implemented by all health workers; and
2. Enabling frontline staff to operationalise this Policy Statement in accordance with the attached *Child Wellbeing and Child Protection Policies and Procedures for NSW Health*.

Please go to **Child Wellbeing and Child Protection Policies and Procedures for NSW Health** to view the above document.

GENERAL RETENTION AND DISPOSAL AUTHORITY: PATIENT RECORDS (GDA17) AND ADMINISTRATIVE RECORDS (GDA21) (IB2019_015)

IB2019_015 rescinds IB2004/20

PURPOSE

The Board of the State Archives and Records Authority NSW has approved a revised General retention and disposal authority: Public health services - patient records (GDA17), and made a minor change to General retention and disposal authority: Public health services - administrative records (GDA 21) in line with the approval of the Functional retention and disposal authority*: Provision and regulation of childcare services* (FA404).

KEY INFORMATION

1. General retention and disposal authority: Public health services - patient records (GDA17)

GDA17 applies to the records of patient care provided by the NSW Health system. The authority underwent a review and was revised on 30 May 2019.

The disposal action for certain patient records has been changed as a result of the review. NSW State Archives and Records website has available the current version of GDA17 and a schedule of amendments and justifications to show where the retention periods have changed. Where they have changed the old entries in GDA17 can no longer be used as the source of legal authority for the disposal of records under the State Records Act 1998.

2. General retention and disposal authority: Public health services - administrative records (GDA 21)

GDA21 applies to records created and maintained to support the management and delivery of public health care services and programs. It was amended on 30 May 2019 to remove classes covered by FA404, Provision and regulation of childcare services. Those sections of GDA21 relating to childcare can no longer be used as the source of legal authority for the disposal of records under the State Records Act 1998.

FA404 applies to the provision of childcare services by NSW public offices including the local health districts.

Refer to the NSW State Archives and Records website for the latest version of both GDA21 and FA404.

ATTACHMENTS

The authorities mentioned in this information bulletin are available from the NSW State Archives and Records website using the following links.

GENERAL RETENTION AND DISPOSAL AUTHORITY – ORGINAL OR SOURCE RECORDS THAT HAVE BEEN COPIED (GA 45) (IB2015_052)

IB2015_052 rescinds IB2009_064.

PURPOSE

To notify the Health system that State Records Authority General Retention and Disposal Authority: *Original or source records that have been copied (GA 45)* has been issued to replace General Retention and Disposal Authority: *Imaged records (GA36)*.

GA 45 provides for the authorised destruction of original or source records that have been copied, provided that certain conditions are met.

KEY INFORMATION

GA 45 provides for the authorised disposal of certain State records which have been successfully copied using microfilming or digital imaging processes. In particular, it describes the circumstances and conditions under which the destruction of certain original or source records is permitted under the provisions of the *State Records Act 1998* after they have been copied.

Whereas GA36 established the conditions under which original records that had been microfilmed or imaged could be destroyed, it primarily applied to paper and excluded records identified as State archives or those required to be retained where created prior to 2000.

The main changes from GA36 to GA45 are:

- Records that are required as State archives or required to be retained in agency may now be destroyed after copying (if the conditions have been met and they do not fall within the exclusions categories) if they were created after 1980, rather than 2000.
- The scope of the authority was widened from original records copied using microfilming or digital imaging processes, to original or source records that have been copied.
- The requirement to assess all requirements for retaining originals was removed, as this condition has become less relevant due to digital copies of paper records being widely accepted.
- Additional exclusions have been included in GA 45 to cover State archives on loan from State Records and records that have high personal value to individuals who were subject to Government control.

GA45 can be accessed on the State Records website:
https://www.records.nsw.gov.au/recordkeeping/original-or-source-records-have-been-copied-ga45

GENERAL RETENTION AND DISPOSAL AUTHORITY - DEPARTMENTS OF FORENSIC MEDICINE (PUBLIC HEALTH SYSTEM) GDA19 (IB2004/44)

The Board of the State Records Authority approved under the provisions of the *State Records Act 1998* on 20 October 2004 the attached "General Retention and Disposal Authority – Departments of Forensic Medicine (Public Health System) as the legal authority for disposing of records retained by Departments of Forensic Medicine in the Public Health System.

Public health services are reminded that the authorisations for destruction of records are given in terms of the *State Records Act* only. A public health service must not destroy any records where they are aware the records may be required as evidence for the purposes of possible legal action or an investigation or enquiry.

GA45 can be accessed on the State Records website:
https://www.records.nsw.gov.au/node/8620851

CHILD DEATH REVIEW TEAM - ACCESS TO RECORDS (IB2014_028)

IB2014_028 rescinds PD2005_286.

PURPOSE

The NSW Child Death Review Team (CDRT) reviews the deaths of children in NSW. The purpose of the CDRT is to prevent and reduce child deaths.

The purpose of this information bulletin is to provide advice to the NSW Health system regarding the requirements of current legislation in relation to the CDRT's access to medical/health records.

KEY INFORMATION

Amendments to the *Community Services (Complaints, Reviews and Monitoring) Act 1993 No 2* were made in 2011[81] in response to the Special Commission of Inquiry into Child Protection Services in NSW which was led by the Hon James Wood AO QC in 2008.

These changes had no ostensible impact on the existing requirements for NSW Health agencies in relation to providing full and unrestricted access to records reasonably required for the CDRT to perform its functions. One notable change however, was the transfer of responsibility for support and assistance of the CDRT from the then Commission for Children and Young People to the office of the NSW Ombudsman, and made the Ombudsman the Convenor of the CDRT.

Legislation providing for the Ombudsman to be the Convenor of the CDRT came into effect on 16 November 2011. Under the *Children and Young Persons (Care and Protection) Act 1998* and Section 38 of the *Community Services (Complaints, Reviews and Monitoring) Act 1993*, there are provisions for the exchange of information about children and young people who have died. The Ombudsman can request full and unrestricted access to NSW Health records when investigating a reviewable death or a death reviewable by the CDRT.

Under Part 5A of the *Community Services (Complaints, Reviews and Monitoring) Act 1993*, the CDRT's functions include:

- Maintaining the register of child deaths occurring in NSW.
- Classifying those deaths according to cause, demographic criteria and other relevant factors.
- Data analysis to identify relevant patterns and trends.
- Undertake research to prevent or reduce the likelihood of child deaths.
- Make recommendations as to legislation, policies, practices and services for implementation by government and non-government agencies and the community to prevent or reduce the likelihood of child deaths.
- Identify further research required by the CDRT or other agencies or persons.

The following persons are required under Section 34K to provide the CDRT with full and unrestricted access to records reasonably required for the purpose of the CDRT exercising its functions:

- The Director-General, the Department Head, Chief Executive Officer or senior member of any department of the government, statutory body or local authority.
- The Commissioner of Police.
- The State Coroner.
- A medical practitioner or health care professional who, or the head of a body which, delivers health services to children.
- A person who, or the head of a body which, delivers welfare services to children (including family support services, children's services, foster care or residential out-of-home care, and disability services).
- The principal of a non-government school (within the meaning of the *Education Act 1990*).

[19] Children Legislation Amendment (Child Death Review Team) Act 2011 No 60
http://www.austlii.edu.au/au/legis/nsw/num_act/cladrta2011n60480.pdf

This includes the right to inspect and, on request, to be provided with copies of, any record referred to in that subsection and to inspect any non-documentary evidence associated with any such record. In the legislation, 'record' means *any document or other source of information compiled, recorded or stored in written form or on film, or by electronic process, or in any other manner or by any other means*.

The legislation also details the requirements of the CDRT related persons in relation to maintaining confidentiality of any information acquired for the purposes of the CDRT.

Each Local Health District must ensure requests for information by the CDRT are met as required, and should implement protocols to facilitate this.

It is noted that:

- Any request from the CDRT should be in writing and reference the legislative provisions relied upon by the CDRT for the release of patient information, namely section 34K of the *Community Services (Complaints, Reviews and Monitoring) Act 1993* ("the Act"). The release must be required for the purpose of the CDRT exercising its functions pursuant to section 34D of the Act.
- Any request from the Ombudsman should be in writing and reference the legislative provisions relied upon for the release of patient information, namely section 38 of the *Community Services (Complaints, Reviews and Monitoring) Act 1993* ("the Act"). The release must be required for the purpose of the Ombudsman's functions pursuant to section 36 of "the Act."

NSW privacy legislation allows the release of personal and/or health information in circumstances where the organisation (a Local Health District for example) is lawfully authorised to disclose the information; as outlined above.

Where information requested by the Ombudsman or the CDRT contains any reference to reports of Risk of Significant Harm (ROSH), the Health service or health worker handling the request should confirm whether details of the reporter's identity and/or the ROSH report itself are required. If not, de-identified information should be provided. Refer to section 29 of the *Children and Young Persons (Care and Protection) Act 1998* for further information regarding the protection of reporter identity and legal exceptions. Also see PD2013_007 Child Wellbeing and Child Protection Policies and Procedures for NSW Health Section 9.1.2 for legal and policy advice on the protection of a reporter's identity.

NOTIFIABLE CONDITIONS DATA SECURITY AND CONFIDENTIALITY
(PD2012_047)

PD2012_047 rescinds PD2005_181.

PURPOSE

The purpose of this policy is to provide guidance for NSW Health staff to manage the security and confidentiality of Notifiable Conditions data in any form, either unit records or aggregated form. This includes:

- Paper notification records;
- Electronic notification records;
- The Notifiable Conditions Information Management System (NCIMS);
- The Secure Analytics for Population Health Research and Intelligence (SAPHaRI); and/or
- Any other form of data that has not been approved for release in the public domain.

MANDATORY REQUIREMENTS

All NSW Health and Local Health District staff must comply with this policy when accessing, managing or analysing notifiable conditions data.

Prior to accessing notifiable conditions data, NSW Health staff must sign each page of the Notifiable Conditions Data Security and Confidentiality Policy Directive, to confirm that they have read, understood and agreed to comply with the policies, procedures and conditions set out in it.

Release of notifiable conditions data must be managed according to section 4 – Data and information release.

IMPLEMENTATION

This policy directive should be distributed to all NSW Health staff. Staff with access to notifiable conditions data must follow the procedure set out in this policy directive.

All staff with access to notifiable conditions data in any form must sign the Notifiable Conditions Data - Confidentiality and Security Agreement at Appendix 1.

1. INTRODUCTION

1.1 About this document

Notifications of Scheduled Medical Conditions made under the Public Health Act include highly confidential information. NSW Health staff from Local Health Districts and the NSW Ministry of Health with access to such information should always protect the security and confidentiality of this information.

1.2 Key definitions

This policy refers to the security and confidentiality of Notifiable Conditions data in any form, either unit records or aggregated data. This includes paper or electronic notifications, the Notifiable Conditions Information Management System (NCIMS), the Secure Analytics for Population Health Research and Intelligence (SAPHaRI), or any other form that has not been approved for release in the public domain.

Notifiable Condition	A medical condition listed under Schedule 1, 2 or 3 in the NSW *Public Health Act* (excluding category 1 conditions and cancer).
Unit record data	For the purpose of this policy directive, 'unit record data' are line listed electronic records of information that relate to the health of an individual which are held by NSW state data collections and owned by NSW Health.
Identifiable data	Information that allows identification of a specific individual.
De-identified data	Information from which identifiers have been permanently removed, or where identifiers have never been included. De-identified information cannot be re-identified.
Aggregate data	Summary data from analysis of unit record data by broad categories (such age group, sex or geographic location) so that it is not possible to identify the individual.
Disclosure	Communication or transfer of information outside NSW Health or Local Health District to Universities, and all other organisations or individuals.
Data custodian	The person with responsibility and administrative control over the ongoing development, data collection, maintenance, review of the data collection and granting access to data.

2. LEGAL AND LEGISLATIVE CONTEXT

The conditions and procedures set out in this document are supplemental and subordinate to any State or Commonwealth statutes, legislation or regulations and any NSW Health policies or guidelines subsequently issued by the Director-General which relate to confidentiality and data security.

Specifically, management of confidential notification data are referred to in the following legislation:
- *NSW Public Health Act 2010*
- *Health Administration Act 1982*

NSW Health Employees with access to notifiable conditions data must also acquaint themselves with the NSW *Health Records and Information Privacy Act 2002* and the Privacy Manual for Health Information (March 2015).

3. ACCESS TO SCHEDULED MEDICAL CONDITIONS DATA

3.1 Personnel

Access to notifiable conditions data for NSW Health Staff should be limited to the minimum level required to fulfil the functions of their position. Individuals requesting access to scheduled medical conditions data (and their managers) must:
- Be aware of their responsibilities with regard to information privacy.
- Undertake training on the operation of any databases or systems which they will operate to record or access personal health information in relation to notifiable conditions data.
- Complete the Confidentiality Agreement (Appendix 1) and identify the appropriate level of access according to their position and role.

3.2 Security

3.2.1 Password Security

NSW Health staff with access to databases containing information on notifiable conditions must observe the following measures in order to maintain security:
- Each individual is assigned a unique username. Access to the data will be controlled by a password. The password must be known only to the individual.

- Passwords are required to be a minimum 6 and maximum 12 characters and contain at least one numeric and at least one text character.
- The individual must not record their password in any file or other electronic document, no matter where or how such a file or document is stored.
- Individuals must change their passwords when requested by system administrators.

3.2.2 Electronic Security

- Access to notifiable conditions data through the NCIMS web based application is to be through individual login passwords only.
- When an individuals' access to the notifiable conditions data is no longer required (i.e. the role of the staff member changes, or their employment by the organisation at which they worked when the Confidentiality Agreement was signed), the staff member and or manager must notify the System Administrators of their changed circumstance, so that role changes can be made or logins disabled.
- System administrators will undertake an audit of NSW Health staff with access at least twice annually.

3.2.3 Physical Security and Storage of Data

- Electronic notifiable conditions data should be password protected and stored on secured networks with appropriately restricted access, not standalone PCs.
- Where access to notifiable conditions data through the NCIMS application is required externally (outside the usual work environment), individuals must ensure that information is not downloaded or saved to a PC.
- Network hardware and any back up or copies of notifiable conditions data must be password protected and stored in a secure location.
- Hard copies of identifiable notifiable conditions data related scheduled medical conditions should be stored in locked cabinets in a secure location.
- Secure document disposal facilities must be available.
- Secure printers and faxes must be available for confidential data management.

3.2.4 Workstation Security

- Care must be taken not to leave documents containing personal health information related to notifiable conditions data on work benches or anywhere they may be visible to unauthorised people.
- Personal health information should be unloaded from computer monitors (or the screen locked) if the monitor is to be left unattended.
- These requirements also apply where notifiable conditions data is handled externally (outside the physical confines of the usual work environment).

3.3 Acceptable use of notifiable conditions data

Notifiable conditions data must only be used for official NSW Health/Local Health District business related to notification or public health action, unless authorised in writing by an appropriate officer (see section 4 - Data and Information Release).

Notifiable conditions data should not be used for personal study. Use of the data for research purposes is subject to the NSW policy directive **PD2015_037**: 'Data Collections - Disclosure of Unit Record Data Held for Research or Management of Health Services' referred to in section 4 - Data and Information Release. Where an individual holds external organisation (e.g. academic) **and** NSW Health/Local Health District appointments, access to notifiable conditions data must not be used for any academic or teaching purposes without prior approval.

4. DATA AND INFORMATION RELEASE

4.1 Legal context for release of data

This section should be read in conjunction with 'Data Collections - Disclosure of Unit Record Data Held for Research or Management of Health Services' (**PD2015_037**).

NSW Health staff with access to notifiable conditions data must not release, pass on or otherwise make available to third parties (where the first party is NSW Health and the second party is the notifiable conditions data user) any data, subset of data or any tables, graphs or other aggregations or manipulations of data obtained or derived from notifiable conditions data where this data or information allows the identification of individual persons, institutions, communities or organisations by any means.

NSW Health staff with access to notifiable conditions data should note that identification of individuals, communities or organisations may occur through the release of specific identifying information such as addresses, or by inference from the combination of multiple non specific or less specific data items (such date of birth plus postcode).

The authority to disclose notifiable conditions data is vested in:

a) the Director General or his/her delegate (for identified unit record data) under the *Health Administration Act 1982* and the *Health Administration Regulation 2012* (subject to the conditions of that Act and Regulation).
b) The Chief Health Officer (for epidemiological data) under the *Public Health Act 2010* and Health Administration Act and *Health Administration Regulation* (subject to the conditions of those Acts and Regulation).

There are no delegations relating to the disclosure of identified unit record notifiable conditions data under the *Public Health Act*.

The delegations under the *Health Administration Act 1982* can be found in section 10 of the Combined Delegations Manual at http://www.health.nsw.gov.au/policies/manuals/Pages/combined-delegations.aspx

Other persons are not authorised to disclose notifiable conditions data.

4.2 Applications for release of data

Applications for release of notifiable conditions data should be made through the relevant data custodian using the appropriate form and will be assessed in accordance with PD2015_037 (Appendix 2).

Applications for the release of identified unit record notifiable conditions data for research or management of health service should be submitted to the NSW Population and Health Services Research Ethics Committee for consideration as per policy directive PD2010_055 *Ethical & Scientific Review of Human Research in NSW Public Health Organisations*. Available at: www.health.nsw.gov.au/policies/pd/2010/PD2010_055.html

Specific guidelines for the release of Aboriginal health information related to notifiable conditions data are required to protect Aboriginal people from the risk of identification as individuals or communities. Disclosure of Aboriginal health information must comply with the NSW Aboriginal Health Information Guidelines.

4.3 Exceptions for release of identifying data

Under the *Public Health Act 2010* (Section 130), it is an offence to disclose information obtained in connection with the Act unless the disclosure is made:

- with the consent of the person whom the information was obtained;
- in connection with the administration or execution of the Act or regulations;
- for the purposes of legal proceedings arising out of the Act or the regulations, of a report of any such legal proceedings;
- with the approval of the Chief Health Officer, or a person authorised by the Chief Health Officer, to a person specified in the approval and the information consists of epidemiological data specified in the approval;
- in any other prescribed circumstances; or
- with other lawful excuse.

4.4 Acknowledgement of use of data in publications

Where notifiable conditions data is approved for release in research or management of health services, all approvals must include a condition that data recipients agree to include a written acknowledgement of the role of NSW Health and the Centre for Health Protection in the fulfilment of any data requests and in the preparation of any report, scientific paper or on-line document (such as a World-Wide Web page). Typically the acknowledgement will appear in the covering letter, foreword or, in the case of electronic documents, as part of the introductory or top-level pages.

The source of notifiable conditions data should be attributed to the underlying data collection. For example, a graph which displays notifiable disease information derived from Notifiable conditions data should have the following attribution: “Source: Notifiable Conditions Information Management System, NSW Health”.

Where data is accessed via a secondary interface, such as SAPHaRI, the underlying data collection should be referenced along with the method of extraction: “Source: Notifiable Conditions Information Management System (Secure Analytics for Population Health Research and Intelligence), NSW Health”.

5. DURATION OF THIS AGREEMENT

The applicant agrees to be bound by the conditions of this Agreement indefinitely or until they sign a new Confidentiality and Data Security Agreement which supersedes this agreement.

The applicant is bound by this Agreement regardless of whether they continue to be an active user of the notifiable conditions data or database system and regardless of whether they remain an employee of or associated with the NSW Health or Local Health District.

Notifiable Conditions Data - Confidentiality and Security Agreement

I, (Full name of applicant) _____

(Work phone number)_____ (work e-mail address)_____

(Employed as Position)_____

By (Name of business unit employing the person)_____

Agree to abide by the confidentiality and data security conditions and procedures set out in this document.

By signing this document and each page of the Notifiable Conditions Data Security and Confidentiality Policy Directive, I confirm that I have read, understood and have agreed to comply with the policies, procedures and conditions set out in it.

I undertake not to knowingly access any personal health information unless such information is essential for me to properly and efficiently perform my duties. I undertake strictly to preserve the confidentiality of this information and I understand that a breach of this undertaking will result in disciplinary action.

I acknowledge my statutory duty under Section 22 and Section 23 of the NSW Health Administration Act 1982 and Section 130 of the NSW Public Health Act 2010, in relation to the disclosure of information. In order to fulfil this undertaking, I will not divulge any identifying, personal or health information regarding individual persons, except to authorised staff of the NSW Ministry of Health, Local Health District or other staff who require such information to carry out their medical or public health duties.

I further undertake to inform my supervisor immediately if I become aware of any breach of privacy or security relating to the information which I access in the course of my duties.

Signature of applicant _____ Date: _____

Position Title: _____

Witnessed by (Name of witness): _____

Signature of witness: _____ Date: _____

To be completed by Unit manager employing the applicant:

I confirm that, to properly fulfil the functions of their position, the above signed has reasonable need for access to notifiable conditions data. I also confirm that, in order to properly undertake the business of NSW Health or Local Health District, the business unit has a valid requirement for access to this data.

Manager's Name: _____

Signature: _____ Date: _____

Position Title: _____

Business Unit Name: _____ Local Health District_____

TRIM REF:

Request for Release of Notifiable Conditions Data

Request for release of notifiable conditions data by requesters external to NSW Health or Local Health District.

To be completed by person making the request

1. **Person and/or agency making request:**

2. **Purpose for which data is sought:**

3. ☐ **Epidemiological/aggregate data** ☐ **Unit record data**
   Where unit record data are sought, please provide a copy of the NSW Population and Health Services Research Ethics Committee approval (according to PD 2012_010)

4. **Description of data requested** *(disease/condition, fields of interest, & time period of interest)*

5. **What (if any) publication of data is intended?**

6. **Date data requested by**: *(allow up to 6 weeks from the date of request)* _____ / _____ / _____

7. **Person taking responsibility for appropriate use of data:**

   Name: _____ Position: _____

   Organisation name: _____

   Phone: _____ Email: _____

   Signature: _____ Date: _____

Fax this form to the Surveillance Manager, Communicable Diseases Branch on 02 9391 9189

NSW Health reserves the right of comment on use of data and interpretation prior to publication.

Request Received: _____ **Request Approved:** _____

Date request completed: ___ ___ / ___ ___ / ___ ___ **Data prepared by:** _____

INTELLECTUAL PROPERTY ARISING FROM HEALTH RESEARCH

(PD2023_007)

PD2023_007 replaces PD2005_370

POLICY STATEMENT

NSW Health recognises that the acquisition and dissemination of knowledge and skills in the area of research and clinical practice is of major public benefit and a primary role of Public Health Organisations.

Public Health Organisations must establish a centralised system of managing their Intellectual Property, utilising an Intellectual Property Committee or other Committees which adhere to the requirements of this Policy Directive. They must also ensure that relevant agreements are in place with Clinical Academics, Visiting Practitioners, Visitors, Students, Independent Research Institutes and other third parties which appropriately deal with Intellectual Property.

SUMMARY OF POLICY REQUIREMENTS

Occasionally, the outcome of Health Research may have a significant commercial value. The objectives of this Policy are to:

- provide a framework for the use, generation, acquisition and management of Intellectual Property in NSW Health
- ensure that Intellectual Property owned by NSW Health is used to generate public value, knowledge transfer and innovation to the fullest extent possible
- encourage health research relating to the public health system and the acquisition and dissemination of knowledge and skills
- foster an environment within which the role of Intellectual Property in enabling clinical application of health research and realising commercial value is understood and recognised
- manage Intellectual Property with a potential commercial value in a manner which benefits the public health system as a whole
- foster an environment within which Intellectual Property issues can be identified and developed, and
- recognise and reward innovation by staff of NSW Health Organisations.

NSW Health provides an environment in which NSW Public Health Organisations are rewarded for the commercial exploitation of Intellectual Property.

The Office for Health and Medical Research will establish a Central Support Service offering assistance in commercialising intellectual property, which Public Health Organisations can delegate matters of that nature to if they are unable to establish or utilise a Committee. Employees of Public Health Organisations will be required to notify the Committee or Central Support Service (whichever is applicable within their Organisation) of Intellectual Property they develop or will imminently develop.

The Committee/ Central Support Service must examine and consider all notifications provided to it by Employees. Further, they will offer legal and commercialisation advice, and make recommendations to the Chief Executive of the relevant Public Health Organisation.

They will also act as a resource for staff on Intellectual Property matters, particularly in relation to the provision of advice on prior disclosure.

The full policy is available at:

https://www1.health.nsw.gov.au/pds/Pages/doc.aspx?dn=PD2023_007

STATE HEALTH FORMS (PD2009_072)

PURPOSE

This policy and attached procedures define the processes for the creation and management of State Health Record Forms incorporated in Health Care Records.

The scope of the policy is to have clinical statewide forms filed in the Health Care Record and the standardisation of the physical Health Care/Medical Record Cover as well as other health record documents such as labels and dividers. This policy includes but is not limited to Inpatient facilities, Community Health Centres and outpatient clinics/areas.

MANDATORY REQUIREMENTS

Health services are required to use standardised forms developed by the NSW Health State Forms Management Committee.

All State Health Record Forms for inclusion (or potential for inclusion) in the Health Care Record must be approved by the NSW Health State Forms Management Committee (SFMC) or Health Service forms for use only within the Health Service must be endorsed by the local forms committee. Health Services must establish:

- A functional health service Health Records Forms Committee.
- Processes to ensure all line managers are accountable for the effective implementation of standard health record forms across the health service, including Directors of Clinical Operations, Clinical Governance and Nursing and Midwifery Services, Health Information Management units and facility based Health Information services.

All NSW Health **State** Record forms can **only be obtained** from the State Print and Print Management contracted supplier.

IMPLEMENTATION

The Health Service Chief Executive is responsible for:

- Establishing a functional health service Health Records Forms Committee, a member of which must act as representative to the NSW Health State Forms Management Committee (SFMC).
- Establishing processes to ensure all line managers are accountable for the effective implementation of standard health record forms across the health service, including Directors of Clinical Operations, Clinical Governance and Nursing and Midwifery Services, Health Information Management units and facility based Health Information services.

The Health Service Records Forms Committee is responsible for:

- Reviewing clinical forms intended for statewide use.
- Approving all clinical forms to be used by its Health Service.
- Ensuring all clinical forms meet the requirements of relevant Australian Standards (e.g. AS2828), NSW Health Policy Directives, a Health Service and State Health Records Forms templates.
- Working with the NSW Health, appointed Print and Print Management Services contracted provider, to facilitate Statewide implementation of the Policy.
- To standardise clinical forms across their health service where possible.
- To provide a formalised communication network between Health Service forms users, Executive, the contracted Print Management Services provider and the SFMC.
- To make recommendations for ongoing introduction/amendment/deletion of forms.

- Ensuring that the terms of reference includes a requirement that direct clinical contribution is obtained as required.

The custodians and authors of Health Records Forms (including the NSW Department of Health) are responsible for:

- Ensuring all steps in the health record forms development processes adhere to policy.
- Submitting relevant forms through their health service representative to the SFMC for review and endorsement.
- If NSW Health Policy Directive or Guideline requires a Health Record form to be used or created in order to comply with that policy or guideline the form must be submitted directly to and processed through the NSW Health SFMC and form a part of that Policy Directive or Guideline before it is distributed for implementation.

Health Support is responsible for:

- Monitoring and Reporting:
  - Supplier (Print and Print Management Services) performance
  - Quality issues (product, artwork and supply)
  - Health Service usage and expenditure
  - Health Records Forms gallery
- Management and support of the SFMC.
- Implementation of a Communication Plan.
- Collaboration with Health Item Master File program.
- Maintenance of the State Health Record Forms and bar-code number allocation register.
- Management of print supplier contract and meeting costs associated with contract, (e.g. destruction of obsolete forms etc).

Persons undertaking the evaluation of forms are responsible for:

- Confirming that the form is compliant with the current Australian Standards on Hospital Medical Records (AS2828).
- Ensuring the form has a consistent format and template.
- Ensuring that the form meets the criteria as per stated throughout the Appendices to this policy.
- There is clear evaluation criteria against which the form is to be evaluated.
- A diverse group is selected to evaluate where applicable and possible and that consultation with any Health Service which is taking part in the evaluation has been consulted with at the highest level.
- Evaluation report is clearly documented and that any changes made to a form are within the boundaries of any policy directive which the form maybe written from.
- That any change which is outside a policy within which the form has been written from is referred back to the content owners for approval.
- That the form is in and remains in State Forms Management Committee State forms template.

BACKGROUND

About this document

In line with the strategic reform initiative, NSW Department of Health has instructed Health Support Services to include forms rationalisation and print management across NSW Health. This project will ultimately cover all forms however initially health records rationalisation is being addressed.

It is estimated that there are approximately 15,000 commercially printed health record forms being used across NSW Health. There is not a common Statewide process to develop or review health (clinical) record forms. Not all forms comply with current Australian standards (e.g. AS2828). NSW Department of Health develops policies and guidelines with health records forms incorporated for implementation across NSW Health without always making provision for:

- A co-coordinated implementation plan across all Health Services and agencies
- Compliance with the current Australian Standards (i.e. for paper-based health care records - AS2828)
- Review of the printing and distribution requirements and impact across all Health Services and agencies.

Key definitions

Health Record Form: A record of the provision of care, assessment, diagnosis, management and/or professional advice given to a person. This term is used inter-changeably with clinical form. A Health Record Form is a Clinical form that is endorsed by Health Service Forms Committee for use within the area/service.

State Health Record Form is considered to be a:

- Clinical Form that is mandated by NSW Department of Health for statewide usage. See appendix 3 for the Statewide forms templates.
- Clinical Form that Health Services have devised for health service or agency use.
- Clinical Form that has undergone a NSW Health State Forms Management Committee (SFMC) approval process.

Health Care Record: A Health Care Record is a documented account of a patient's/client's health evaluation, diagnosis, illness, treatment, care, progress and health outcome that provides a means of communication for all health care personnel during each visit or stay at a health service. It is the primary repository of all information regarding patient/client care.

The record is used to care for the patient/client during an episode of care but may also be used for future episodes of care, communication with external health care providers and regulatory bodies, planning, research, education, financial reimbursement, quality improvement and public health. The health care record may also become an important piece of evidence in protecting the legal interests of a patient/client, clinician or Health Service.

The health care record may be in hard copy, electronic or other form, and unless otherwise indicated, the provisions of this policy directive apply equally to all health care records regardless of the media in which they are kept.

Health Service: a Health Service within the boundaries of the *Health Service Act 1997* (which includes Area Health Services/Chief Executive Governed Statutory Health Corporation, Board Governed Statutory Health Corporations, Affiliated Health Organisations - Non Declared, Affiliated Health Organisations - Declared, Public Hospitals)

SFMC: NSW Health State Forms Management Committee.

Site: Physical facility or service e.g. Hospital, Community Health Centre, Renal Service, Justice Health site.

Location: Ward, Oral Health, Clinic, Unit e.g. ICU, ED

Rationale

The introduction of statewide health records forms will assist in:

- Promoting quality processes through
  - Consistent business practices when designing and implementing clinical forms across NSW Health.
  - Statewide standardised document control for all Health Record Forms included in NSW Health Policies.
- Health Services and agencies transferring to electronic medical records systems.
- Streamlining the implementation of NSW Health Policy and forms at the Health Service and agency level.
- Supporting scanning of health care records, including a standardised bar-coding system and the maintenance of a State Health Record Forms Register.
- Promoting effective and efficient work practice by:
  - Decreasing the workload at Health Services and Agencies, who are currently responsible for the implementation of forms incorporated in NSW Health policies and guidelines.
  - Standardising information and formatting to assist staff across NSW Health to accurately and consistently collect patient information, regardless of the health care facility or service.

1. NSW Health State Forms Management Committee

1.1 Terms of Reference

The Committee has the following Terms of Reference:

- Co-ordinate the development of State Health Record Forms and documents.
- Standardise State Health Record Forms and documents and across the whole of NSW Health where possible.
- Ensure compliance with relevant Australian Standards where appropriate.
- Ensure liaison and co-ordination with the Electronic Medical Records Project (eMR) and other related electronic information systems.
- Provide a formalised communication network between form users, NSW Department of Health, Health Support and the contracted Print and Print Management Services Supplier.
- Disseminate forms and related information across NSW Health.
- Approve statewide health record forms and allocate a unique form number.
- Oversee the maintenance of the State Health Record Forms Register.
- Ensure actions and issues are assigned to the appropriate personnel either within Health Support, Health Services/Agencies, NSW Department of Health or the contracted Print and Print Management Services Supplier.
- Regularly review the statewide electronic forms web-site, when developed, for accuracy and initiate remedial action as required.
- Make recommendations for ongoing introduction/amendment/deletion of forms.
- To complement existing Health Service Forms Committees to ensure only endorsed approved (local or state) health record forms are produced for filing in the Health Care Record.

1.2 Governance

The Committee will be responsible to the Deputy Director-General, Health System Support.

1.3 Representation

NSW Health Services (NSCCAHS/HNEAHS/SESIAHS/SSWAHS/SWAHS/GSAHS/GWAHS/ NCAHS/CHW and Justice Health)

Health Support
By Invitation as required

- Standards Australia representative
- NSW Department of Health representative
- eMR Project Team representative
- Ambulance Service NSW representative
- MH-OAT representative
- Print and Print Management Services Contractor representative
- Other persons involved with special projects involving clinical forms and health records

3. Development of Statewide Health Record Forms

3.1 Identification of need for new or revised health record forms

Sources for identifying the need for the development or revision of a State Health record form include, but are not limited to:

- State executive sources including legislative requirements, NSW Health Policy Directives, Guidelines, Australian Standards and specific industry requirements, better practice or research evidence
- Service reviews, Incident Information Management System (IIMS), complaints, root cause analysis (RCAs) and peer review
- Internal and External audit reports

3.2 Development Stage

Custodians and authors of proposed State Health Record forms are required to:

- Search for an existing or similar form.
- Source relevant documentation where possible and ensure forms comply with Best Practice, both in forms design and clinical practice.
- Ensure compliance with NSW Health policy directives, guidelines and information bulletins.
- Ensure there is endorsement from Health Services and supply confirmation of this in writing to the SFMC.
- Ensure that the form utilises the SFMC Forms Template.
- Contact relevant Health Service Forms Committee to identify which form is to be replaced and provide reasons for replacement
- Through their SFMC representative, send an electronic version of the form and completed application package for approval to the SFMC – see appendix 7 for application checklist
- Consider usage when stock numbers are being established.
- Specify colour, print and other specifications at the time of form submission.
- Comply with relevant Australian Standards (e.g. AS2828)
- Ensure forms are developed in liaison with appropriate clinical representation at both State and Area level.
- Ensure forms meet medico-legal requirements.
- Ensure relevant stakeholders are alerted to form development.
- Ensure training and/or implementation guidelines and materials are developed and distributed to appropriate Area representatives prior to the introduction of the form.

- The AHS is to establish a single line of communication with the SFMC; and the process for submission to the SFMC should confirm the above has been undertaken and the proposal endorsed at an Area Health Service level, prior to submission.

3.3 Considerations

The impact of creating new Health Record forms is to be considered. This impact may include:

- Increased staff work load due to staff completing the form and Medical Record/Clinical/Health Information Department filing the form.
- Increased size of medical records, which may impact on storage space and have potential OH&S issues due to the weight
- Costs – for example the colour of form or print, NCR paper, A3 size and booklets.

Instructions/protocols/checklists should not, as a general rule, be included on the back of forms. Rather, alternate approaches should be explored to minimize interference with clinical documentation and unnecessary space requirements in the health care record. For example, instructions can be laminated and placed in an obvious area when introducing the form and/or be included in a procedure.

Only Health Record forms endorsed by the SFMC (or Health Service Forms endorsed by the local Forms Committee) will be filed in the Health Care Record. If a Health Record form is released for use without an authorized form number and bar-code identifier when one is required, then it will be deemed ineligible to be filed into the Health Care Record.

Revised forms, once approved, will be printed for use when the current supply is depleted. If a form is deemed to pose a clinical risk it is to be destroyed at the contracted printers and the artwork removed.

Photocopying of blank State Health Record forms for use and filing in the Health Care Record is not permitted.

3.4 Validation Stage

The NSW Health State Forms Management Committee (SFMC) will review the proposed Health Record form based on the following criteria:

- Form must comply with NSW Health State templates and current Health Record Standards (e.g. AS2828).
- A unique form number must be allocated from the State Forms Register.
- A bar code identifier must be allocated based on the determined state form number.
- Working with the NSW Health contracted Print and Print Management supplier, to manage printing of the form using the approved SFMC template.
- Informing author or custodian of approval or non-approval
- Managing the gallery of State Health Record Forms.
- Provide support to authors in design and concepts (e.g. colours of print, paper, scanning requirements).

3.5 Consultation Phase

A consultation phase will occur for a two week period from the time the form is released to the AHS's or relevant Health Bodies for comments to be received back.

3.6 Evaluation Criteria

All Health Record Forms will be evaluated on:

- best practice through
  - Consistent format and standardised template.
  - Compliance with current Australian Standards on Hospital Medical Records (AS2828)
- provision of supporting policy and guidelines
- current clinical policy
- clinical work flow
- financial resources
- implementation requirements and the provision of training materials
- decrease in duplication of data items
- decrease in space requirements of health records i.e. storage requirements.

The evaluation process shall include consultation with the Health Services.

3.7 Transition Period

Implementation

High usage clinical forms will be identified for standardisation into the NSW Health statewide template. It is expected that this is where the greatest impact should be gained for cost saving and standard work practice. Examples of these forms are; Medical record covers, Progress notes, Fluid Balance charts, etc.

Phased Transition

The SFMC will determine based on usage and/or clinical criteria the priority for the standardisation of Statewide forms. If more than one form exists then there will need to be consultation with the key stake holders via the members of the SFMC about the design of the most clinically functional and cost effective solution.

Once the SFMC has developed a new form the Print Management Services vendor will be advised not to replace current stock of previous old forms. When the stock is low or no longer available the "Flag" on the Print Management Services vendor's web site will direct users to the NSW Health Statewide standardised form that must be used.

The replacement Statewide form must be available on the Print Management Services vendor's web site before old stock is depleted to ensure continuity of supply.

If old stock is still available after 6 months the Print Management Services vendor will identify this issue with the SFMC for a decision to either:

- Contact the owner of the form and advise them of "The option to write off old stock"
- Make the stock redundant
- Discuss with the relevant Health Service to determine who will bear this cost.

The Option to Write Off Old Stock

If a Health Service or NSW Department of Health Division needs to write off excess "old" stock (in order to introduce "new" stock rapidly), they must be advised that:

a. The Service Level Agreement Contract allows that the Print Management Services vendor is responsible for the (write off) cost of the first 3 months of stock held,
b. The Health Service would be responsible for the cost of the remaining (unused) "old" stock, and the costs of destruction.
c. Where there is stock held which has not moved in the last 12 months, the Print Management Services contractor would notify the owner of the stock of their intent to write off and destroy (noting the above incurred costs), unless advised otherwise within 2 months time
d. If no response or advice is given after that period, then the stock will be written off and the entire cost of the stock and destruction costs will be invoiced to the initiating source.

State Mandated Forms (those included in a NSW Health Policy Directive)

a. If the form is Print on Demand (POD), it can be transitioned to the NSW State Forms Template immediately as there is no stock on hand.
b. If the form is warehoused existing stock will be run out and the form transitioned into the NSW State Forms Template ready to be printed on the next reprint.
c. New forms required by Policy Directives in the process of formulation will follow the requirements of this policy elsewhere described.

3.8 Health Record forms that require a trial

The following guidelines are to be followed for introduction of a new State Health Record Forms which are not available in the NSW Health Print and Print Management Contractor's State Health Record Forms Library:

a. Complete the request and forward it to the Health Service Forms Committee Representative advising of the need to develop/introduce a State Health Record Form. See Appendix 7 for the Application Checklist.
b. The Health Service or agency Forms Representative is to advise the NSW Health State Forms Management Committee (SFMC) Convenor of the proposed form.
c. The SFMC is to formulate the appropriate Working Party who will be responsible for co-ordinating, providing education and supervising the form trial.
d. The time period required for the trial of a form will be dependent on the usage of form. For forms that have a high usage, a minimum trial period of up to 3 months may be required, whilst forms that have a low usage may require up to a 12 month trial period.
e. During the trial period, stocks of the "old" form (if a revised form) must be withdrawn from circulation, to enable a true and accurate trial of the "new" form to occur.
f. All trial forms to adopt the State Forms Template and to be allocated a 'Trial State Forms Number category and bar code'.
g. At the end of the trial period, the outcome of the trial must be evaluated to determine whether the new form has been accepted by users (results of a compliance audit). If the trial is unsuccessful the current version should be deleted from the State Health Record Forms website as a State form or re-designed. If a local area wishes to continue using the trial form they must give it a local form number.
h. The final form to be registered with State Forms Number, category and barcode.

3.9 Low Usage Forms

Those forms that are identified by the SFMC as extremely low usage can be made available via the relevant website (primarily the NSW Health authorised Print and Print Management suppliers' website). These forms can be viewed and printed direct from the website. These forms must adhere to this policy including usage of the approved NSW Health clinical forms artwork and must be approved by the NSW Health SFMC. As identified by the SFMC by usage at the present time this is expected to be in the realm of 100 per annum per site.

ABORIGINAL AND TORRES STRAIT ISLANDER ORIGIN – RECORDING OF INFORMATION OF PATIENTS AND CLIENTS

(PD2012_042)

PD2012_042 rescinds PD2005_547.

PURPOSE

The policy directive and the associated procedures document outlines the requirements for collecting and recording accurate information on whether clients of NSW Health services are Aboriginal and/or Torres Strait Islander. Aboriginal and Torres Strait Islander people are under-reported in many health related data collections in NSW. Self-report in response to the standard Australian Bureau of Statistics question about a person's Aboriginality is the most accurate means of ascertaining whether a client is Aboriginal and/or Torres Strait islander. The standard question must be asked of all clients of NSW Health services, and the information needs to be recorded accurately according to national standards.

MANDATORY REQUIREMENTS

1. All NSW Health services are required to collect consistent and comprehensive data on Aboriginal and Torres Strait Islander health.

2. The *Aboriginal and Torres Strait Islander Origin – Recording of Information of Patients and Clients: Procedures* document describes the standards required for the accurate collection and recording of data.

3. The standard question seeking information about a person's Aboriginality should be asked of all clients of NSW Health services to establish whether they are Aboriginal and/or Torres Strait Islander:
   'Are you (is the person) of Aboriginal or Torres Strait Islander origin?"

4. These standard response options should be provided to the clients to answer the questions (either verbally or on a written form):
   - ☐ No
   - ☐ Yes, Aboriginal
   - ☐ Yes, Torres Strait Islander
   - ☐ Yes, both Aboriginal and Torres Strait Islander

5. Asking the question:
   - Staff responsible for registering a client should ask the standard question when the client is first registered with the service.
   - The question should be asked of all clients irrespective of appearance, country of birth, or whether or not the staff know the client or their family background.
   - Clients may be asked the question directly, or asked to complete a form with the question included, and the client should answer this question themselves.
   - Specific situations related to asking the question are described in Section 2 and Section 4 of the Procedures document.

6. Recording the Information:
   - Information systems should record whether a client is Aboriginal or Torres Strait Islander using the standard categories, which are outlined in Section 3 in the Procedures document.
   - Responses to the standard questions should be coded as described in Section 3 in the Procedures document.

- A response to the standard question should be a mandatory requirement when registering or entering client details in electronic recording systems.
- Local data management systems must be able to identify those records that are coded as not stated/inadequately described which require follow-up.

7. Training in the correct and consistent recording of whether a client is Aboriginal and/or Torres Strait Islander must be delivered to all staff. See Section 5 in the Procedures document.

8. Data quality assurance and validation activities must be undertaken at the local level (Section 6 Procedures document) and by NSW Ministry of Health (Section 7 Procedures document).

IMPLEMENTATION

1. Roles and Responsibilities of NSW Health agencies:

- Chief Executives, Health Service Executives, and Managers are responsible for the implementation of this policy and procedures at the local level.
- All NSW Health employees are responsible for the accurate recording of Aboriginality when ever this is part of their role.

2. Roles and Responsibilities of NSW Ministry of Health:

- NSW Ministry of Health is responsible for providing the mandatory requirements and procedures, and to support the implementation and evaluation of this policy.

3. Activity Based Funding

With the implementation of activity based funding in July 2012, accurate and consistent recording of Aboriginality is essential for the effective application of associated weighting and will enable LHDs/SHNs to:

- Monitor expenditure on health care against funding for Aboriginal clients.
- Enable clinicians and managers to understand the factors contributing to cost variations including the extent to which these relate to patient complexity or differences in the way services are delivered to Aboriginal clients.
- Make decisions about where to invest additional resources to meet increasing demand in the most cost effective way for Aboriginal clients.
- Contribute information about costs to the national "price setter", the Independent Hospital Pricing Authority.
- Be appropriately funded according to the efficient pricing for treating Aboriginal patients.

1. BACKGROUND

1.1 About this document

This Policy Directive replaces Policy Directive PD2005_547 '*Aboriginal and Torres Strait Islander Origin - Recording of Information of Patients and Clients'*. This policy directive revises and updates the previous policy.

1.2 Legal and legislative framework

The '*National best practice guidelines for collecting Indigenous status in health data sets'* (AIHW, 2010) documents the national approach for collecting and recording accurate information on whether a client is Aboriginal and/or Torres Strait Islander.

The Council of Australian Governments (COAG) National Indigenous Reform Agreement requires all jurisdictions, including NSW, to implement the National Best Practice Guidelines.

This policy and procedures document incorporate the activities outlined in the National Best Practice Guidelines. The implementation of these will ensure NSW meets their National Indigenous Reform Agreement obligations in relation to identification of Aboriginal and Torres Strait Islander people.

2. ASKING THE QUESTION

2.1 The Standard Aboriginal and Torres Strait Islander Origin Question

The following question should be asked of all clients to establish whether they are Aboriginal and/or Torres Strait Islander:

'Are you (is the person) of Aboriginal or Torres Strait Islander origin?"

2.2 The standard response options

2.2.1 Three standard response options should be provided to the clients to answer the questions (either verbally or on a written form):

- ☐ No
- ☐ Yes, Aboriginal
- ☐ Yes, Torres Strait Islander
- ☐ Yes, both Aboriginal and Torres Strait Islander

2.2.2 If the question has not been completed on a returned form, this should be followed up and confirmed with the client.

2.3 How to ask the question

2.3.1 Staff responsible for registering a client should ask the standard question seeking information about a person's Aboriginality when the client is first registered with the service.

2.3.2 The question should be asked of all clients irrespective of appearance, country of birth, or whether the staff know of the client or their family background

2.3.3 The question should be placed within the context of other questions related to cultural background, such as country of birth and main language spoken.

2.3.4 Clients may be asked the question directly, or asked to complete a form with the question included, and the client should answer this question themselves.

2.3.5 In some situations (such as in the case of birth and death registrations) the client will be unable to answer the question themselves. In this case it is acceptable for certain others (such as mother, father, close friend, relative, or household member) to be asked the question and to answer the question on the client's behalf if they feel confident to provide accurate information.

2.3.6 In instances where the client is temporarily unable to answer the question, it is also acceptable for certain others who know the client well to respond on their behalf; however this response should be verified with the client wherever possible.

3. RECORDING RESPONSES

3.1 How to record responses

3.1.1. Information systems should record information on whether a client is Aboriginal and/or Torres Strait Islander using the standard national categories, which are:

1. Aboriginal but not Torres Strait Islander origin
2. Torres Strait Islander but not Aboriginal origin
3. Both Aboriginal and Torres Strait Islander origin
4. Neither Aboriginal nor Torres Strait Islander origin
9. Not stated/inadequately described

In addition databases in NSW should use the following additional category:

8. Declines to respond

3.1.2 Responses to the standard questions should be coded to the following national standards.

Response	Coding Category
'Yes, Aboriginal' is ticked, but 'Yes, Torres Strait Islander' is not ticked.	1
'Yes, Torres Strait Islander' is ticked, but 'Yes, Aboriginal' is not ticked.	2
'Yes, Aboriginal' is ticked, and 'Yes, Torres Strait Islander' is ticked.	3
'Yes, both Aboriginal and Torres Strait Islander' is ticked	3
'No' is ticked	4
'No' is ticked and either/both 'Yes, Aboriginal', and 'Yes, Torres Strait Islander' is ticked.	1, 2 or 3
Client is capable of responding but declines to respond following prompting/follow-up	8
Where it is impossible for the question to be asked during the contact period	9
Response to the question has been left blank or is incomplete	9

(Note these categories represent national standards, with the addition of the code 8, used by NSW to identify clients who have declined to respond. In the national categories, the NSW Code 8 would be coded as 9. See Section 3.3 for further information).

3.2 Mandatory completion

A response to the standard question on a person's Aboriginality should be a mandatory requirement when registering or entering client details in electronic recording systems. Staff registering or entering details of a client should not be able to proceed with registration until a response has been completed.

3.3 Identifying records for follow up

3.3.1 Local data management systems should be able to identify those records that require follow up. In NSW the code 8 is used (as described in 3.1.2) to identify clients who have declined to answer, and therefore do not require follow up. Client's coded as 9 (not stated/inadequately described) because of situations where it was impossible for the question to be asked during the contact episode, and other situations where the response was left blank or incomplete, require follow up with the client, to determine the correct code.

3.3.2 Additional categories used by NSW or in local systems for the purposes of workflow management and follow-up must be mapped to the correct national category (Categories 1, 2, 3, 4, and 9) before the data are provided to the national data custodian. In NSW, data coded as category 8 (declined to respond) must be recoded to category 9 before submission to national data custodians.

4. IMPLEMENTING THE PROCEDURES IN SPECIFIC SITUATIONS

4.1 In the event of a birth

4.1.1 For perinatal data collections, the standard questions on whether a client is Aboriginal and/or Torres Strait Islander should be asked directly of the mother, regardless of the information separately recorded in the hospital database.

4.1.2 In NSW, information on whether the mother and the newborn baby are Aboriginal and/or Torres Strait Islander must be recorded in the NSW Perinatal Data Collection (See NSW Policy Directive **PD2015_025**).

4.1.3 The mother should be asked to provide the information on whether her baby is Aboriginal and/or Torres Strait Islander in addition to her own Aboriginality.

4.1.4 It should not be assumed that the baby will share the mother's origin. In particular, if the mother does not report her origin as Aboriginal and/or Torres Strait Islander, it should not be assumed that the newborn is therefore not Aboriginal or Torres Strait Islander.

4.2 If the client is a child under 15

4.2.1 Where the client is a child under 15 years of age, the parent or guardian is asked to declare whether the client is Aboriginal and/or Torres Strait Islander on their behalf.

4.2.2 If the parent or guardian is not available, certain others may be asked to provide this information (see 2.3.4).

4.2.3 If the accompanying adult is unable to provide this information, the child's parent/guardian should be contacted as follow-up to establish whether the child is Aboriginal and/or Torres Strait Islander.

4.3 If the client is too ill to be questioned or is unable to respond

4.3.1 When the client is unable to respond to the standard question because they are too ill, unconscious, or too ill due to psychiatric condition or dementia, in the first instance the staff member should ask the client's carer, relative, or any other person accompanying the client (see 2.3.4).

4.3.2 The response provided by this person should be verified with the client when they have recovered sufficiently to be able to answer the questions themselves.

4.3.3 If the person accompanying the client does not know whether the client is Aboriginal and/or Torres Strait Islander, the client should be asked the question directly when they are capable of responding.

4.3.4 In the event that the person accompanying the client does not know whether the client is Aboriginal and/or Torres Strait Islander and the client does not recover sufficiently to provide this information, the answer to the standard question on Aboriginality should be recorded as a non-response.

4.4 If the client does not speak English, or cannot read or write

4.4.1 If the client does not speak English, but is accompanied by someone who can interpret for them, it is recommended that the person accompanying them is asked to translate the question and their response.

4.4.2 If there is no-one with the client who can speak English, it is recommended that an interpreter, or Aboriginal or Torres Strait Islander liaison officer (who can interpret the relevant Aboriginal or Torres Strait Islander language spoken by the client) be called to assist.

4.4.3 If a form is to be provided and the client cannot read or write, it is recommended that an appropriate staff member (e.g. an interpreter, social worker, Aboriginal or Torres Strait Islander Liaison Officer) go through the questions with the client.

4.4.4 All clients' should be given the opportunity to respond to the standard Aboriginality question for themselves. While a client who speaks an Aboriginal language may be highly likely to be an Aboriginal person, their Aboriginality cannot be assumed; the client may be of both Aboriginal and Torres Strait Islander for example.

4.4.5 Non-English speaking clients from various cultural backgrounds should also be asked the question and given the opportunity to self-report in response to the standard question.

4.5 If the client is deceased

4.5.1 Funeral directors, undertakers, medical practitioners and coroners responsible for registering a death or assessing the cause of death must ask the next-of-kin about whether the deceased is Aboriginal and/or Torres Strait Islander. If no next-of-kin is available, then the question should be asked of the broader family. If this information is not able to be obtained from either of these sources, another person who knew the deceased well may be asked to provide this information.

4.5.2 If information on whether the deceased is Aboriginal and/or Torres Strait Islander is missing on the death registration form, the funeral director should follow up with the next-of-kin before the form is sent to the registry. Similarly, medical practitioners or the coroner responsible should attempt to complete this item before the deceased's information is sent to the registry.

4.6 If staff are reluctant to ask the question

4.6.1 Staff should be encouraged to collect information from all clients in a professional and respectful manner, without anticipating or making assumptions about the client's identity or about how the client is likely to react or respond to any given question. Staff should be encouraged to regard the standard question on a person's Aboriginality as no more or less sensitive or problematic than other items of personal data routinely collected from clients.

4.6.2 All client's, whether Aboriginal, Torres Strait Islander, or non-Aboriginal or Torres Strait Islander, have the right to self-report, rather than have their identity assumed and recorded on their behalf. To refrain from asking any client the standard question on a client's Aboriginality is an act of discrimination which infringes upon the client's right to respond to this question for themselves.

4.6.3 Staff should not modify the standard question in any way. The question should be asked correctly, consistently, and uniformly of all clients, using the wording precisely as stated in this policy and procedure.

4.7 If the client wants to know why they are being asked the question

4.7.1 The following provides several responses that may assist staff in explaining to clients the reasons for asking the standard question on a client's Aboriginality:

a. The question on whether a person is Aboriginal and/or Torres Strait Islander is one of several questions related to a client's identity and demographic characteristics that are asked of all clients who attend a health service, enrol with Medicare, or are involved in the registration of a birth or death.

b. The collection of information on whether a person is Aboriginal and Torres Strait Islander is necessary for government and other services to plan and deliver appropriate services for all Australians, to assess the impact of services on particular groups in the community, and to improve health care and to monitor changes in health and wellbeing over time.

c. The response to this question allows service providers to ensure that Aboriginal and Torres Strait Islander clients have an opportunity to access relevant services such as Aboriginal liaison officers and Aboriginal health workers, health checks, Aboriginal and Torres Strait Islander specific immunisation considerations and PBS listings if they choose.

d. Service providers cannot make assumptions about whether a person is Aboriginal, Torres Strait Islander, or non-Aboriginal and Torres Strait Islander, therefore this information can only be determined by asking the client the standard question.

e. All personal information is protected by privacy law. The Privacy Manual for Health Information (March 2015) provides operational guidance for health service staff to the legislative obligations imposed by the *Health Records and Information Privacy Act 2002*, and outlines procedures to support compliance with the Act in any activity that involves personal health information.

4.7.2 Should a client request a more detailed explanation of where the data go or the ways they are used, staff may wish to refer the client to the Australian Institute of Health and Welfare website **www.aihw.gov.au** or the Australian Bureau of Statistics website **www.abs.gov.au**.

4.8 If the client objects to the question or declines to answer

4.8.1 Where a client objects to the question or declines to answer they should be informed of their right to decline to answer the standard question on whether a client is a Aboriginal and/or Torres Strait Islander person and be advised that their level of care and access to services will not be affected if they choose not to answer the question.

4.8.2 While staff have a duty to collect and record information on whether a client is Aboriginal and/or Torres Strait Islander from all clients as correctly as possible, they are not obliged to convince a disgruntled, upset or unwilling client to respond to the question.

4.8.3 While staff have a duty, if queried, to explain to clients why this question is being asked, they are not obliged to justify the use of the standard question.

4.9 If the client chooses not to answer the question 'correctly'

4.9.1 There may be occasions where a client is known to staff as an Aboriginal or Torres Strait Islander person yet the client chooses not to report as such in response to the standard question. Conversely there may be occasions where a known non-Aboriginal or Torres Strait Islander person chooses to report themselves as Aboriginal or Torres Strait Islander in response to this question.

Clients have a right to self-report whether they are Aboriginal and/or Torres Strait Islander and staff should therefore always record the response that the client provides; they should not question or comment on the client's response.

4.9.2 The client's recorded response should not be altered or annotated in any way to reflect the views of the staff member collecting the information.

4.10 If a client identifies as Aboriginal and/ or Torres Strait Islander

4.10.1 Any client who self-reports as Aboriginal and/or Torres Strait Islander should be offered the services of Aboriginal liaison officers or Aboriginal health workers where available; however, the client's choice to engage or not engage with such services should be respected.

4.10.2 Information about a person's Aboriginality should be included on the client's discharge summary.

4.11 If the client wishes to change personal information on their record

4.11.1 All clients should have the opportunity to confirm or update any previously recorded personal information on a regular basis, including confirmation or alteration of a record that they are Aboriginal and/or Torres Strait Islander.

4.11.2 The NSW Health Client Registration Policy (PD2007_094) describes when to update client registration details. Client/patient details, including information on Aboriginal and Torres Strait Islander origin, should be checked and confirmed or updated, as appropriate each time a client presents for a new phase of treatment.

4.11.3 Any changes to the previously recorded information on whether a client is Aboriginal and/or Torres Strait Islander should be received without comment and clients should not be required to provide a reason for changing their record.

5. STAFF TRAINING

5.1 Training in the correct and consistent collection of information on whether clients are Aboriginal and/or Torres Strait Islander must be delivered to all staff.

5.2 This training may be delivered as part of a training that focuses on overall data collection and data quality.

5.3 While it is recommended that all staff receive training in cultural safety for Aboriginal and/or Torres Strait Islander clients, such training should not be considered a pre-requisite for the collection of information on whether a client is an Aboriginal and/or Torres Strait Islander person using the standard question.

5.4 All staff must complete training requirements as outlined in the *Respecting the Difference: An Aboriginal Cultural Training Framework for NSW Health* (PD2011_069).

5.5 All persons responsible for collecting, recording and validating information on whether clients are Aboriginal and/or Torres Strait Islander should be able to demonstrate the following competencies:

a. An ability to ask the standard questions *Are you of Aboriginal or Torres Strait islander origin?'* correctly, and to correctly record responses on paper forms and/or computer systems.

b. An ability to clearly explain to clients the reason for collecting this information.

c. An understanding of why it is important to collect and record information on whether all clients are Aboriginal and/or Torres Strait Islander.

d. An understanding of why it is important to collect this information correctly and consistently, using the standard question.

e. An understanding of the voluntary nature of self-reporting a client's Aboriginality, and of a client's right to decline to answer this question or to change the information recorded.

f. Knowledge of available information and services for Aboriginal and Torres Strait Islander clients, and ability to convey this to clients as required.

g. Knowledge of and ability to conduct follow-up procedures for obtaining missing information, including whether a client is Aboriginal and/or Torres Strait Islander.

6. DATA QUALITY ASSURANCE AND VALIDATION AT LOCAL SERVICE LEVEL

For data quality assurance and validation at the local service level, local service providers must:

6.1 Review all forms and data recording systems to ensure the standard question on whether a client is Aboriginal and/or Torres Strait Islander is included and that coding categories are consistent with this policy and procedure.

6.2 Provide appropriate training, supervision and support to staff in primary data collection and data management roles, to ensure data items such as the item recording a client's Aboriginality are collected correctly and consistently

6.3 Ensure data collection processes and systems are streamlined and user friendly for staff in data collection roles.

6.4 Review client intake procedures to ensure client privacy is maintained, particularly in areas where clients are interviewed to obtain personal information.

6.5 Ensure staff across various levels and disciplines within the service are prompted to check for and follow up on missing client registration details, including information on a client's Aboriginality, in their contact with clients.

6.6 Establish business rules for distinguishing between 'not stated/inadequately described' records that are a result of a client's inability to answer (and are therefore to be followed up) and 'not stated/inadequately described' records in which the client declined to answer (which do not require further follow up).

6.7 Establish policies and procedures for correctly following up and correctly coding records with incomplete information on whether a client is Aboriginal and/or Torres Strait Islander.

6.8 Establish business rules for checking information on a client's Aboriginality against other data items, particularly country of birth, language spoken, and Medicare eligibility.

6.9 Monitor trends in the number and proportion of Aboriginal and/or Torres Strait Islander clients by comparing with the previous year's data, to determine whether there have been any obvious errors in coding.

6.10 Conduct data quality surveys involving direct surveys or interviews with clients, to determine the consistency and accuracy of the collection of information on whether clients are Aboriginal and/or Torres Strait Islander and to develop estimates of under-reporting.

7. DATA QUALITY ASSURANCE AND VALIDATION AT NSW MINISTRY OF HEALTH

For data quality assurance and validation state-wide, NSW Ministry of Health must:

7.1 Ensure data providers are aware of the policy and procedure

7.2 Ensure the correct business rules are applied to cope with different identifications when there are two sources of data (e.g. cause of death forms and death registrations). For example, if one data source identifies the client as Aboriginal or Torres Strait Islander, the record relating to this client should be coded accordingly.

7.3 Regularly monitor information on whether clients are Aboriginal and/or Torres Strait Islander and provide continuing feedback on data quality to local services. In particular, monitor levels of 'not stated' reported from local service providers to determine whether further education or assistance is required.

7.4 Regularly check that codes used for recording a client's Aboriginality in local systems are consistent with the policy and procedures, in particular check that invalid or inappropriate codes are not being used.

7.5 Compare data for Aboriginal and Torres Strait Islander persons with variables such as country of birth, language spoken, and Medicare eligibility, and follow up with local service providers to ensure any issues are investigated.

7.6 Regularly check that local service providers have not set default values for the standard question seeking information on whether a client is Aboriginal and/or Torres Strait Islander. This would be evidenced by no reporting of records with a 'not stated' response to the standard question.

7.7 For each local service, compare the number and proportion of records with information indicating clients are Aboriginal and/or Torres Strait Islander with the previous year's data to determine whether there have been any probable errors in coding.

7.8 Establish a system of review and audit of data collection processes and data quality for local service providers, including review and audit of Aboriginal and Torres Strait Islander data.

7.9 Inform the national data custodian of any events or issues that may have affected the quality of data recording whether clients are Aboriginal and/or Torres Strait Islander for a given period.

7.10 Establish a procedure for the prompt investigation and response to data validation requests from the national data custodian.

8. MONITORING

Monitoring of the implementation and impact of this policy directive will be undertaken by NSW Ministry of Health and Local Health Districts:

8.1 In partnership with the Australian Institute of Health and Welfare, NSW Ministry of Health conducts a biannual survey which estimates the level of correct reporting of Aboriginal and Torres Strait Islander people in NSW public hospital data.

8.2 Local Health Districts will be required to determine appropriate indicators to monitor the adherence to this policy.

FRONT SHEET/PRINCIPAL DIAGNOSIS

To be read in conjunction with the Health Care Records Documentation and Management Policy (PD2012_069).

The front sheet of the health record must contain the **principal diagnosis,** other diagnoses and any operation(s) performed. Other conditions of significant concern should also be recorded.

The condition to be selected as Principal Diagnosis is the diagnosis established, after study, to be chiefly responsible for occasioning the patient's episode of care in hospital (or attendance at the health care facility). For acute surgical hospitals this will generally be the condition or reason for the surgical procedure(s) performed. The principal diagnosis is the major collection item for hospital morbidity statistics and is an important factor in research, evaluation, planning and allocation of resources.

The front sheet must be signed and designated by the medical officer in charge of the patient's care. This responsibility may be delegated to another medical officer, however, the medical officer in charge of the patient's care remains responsible for ensuring that the delegated duty is performed.

The front sheet of the medical record should be completed within 14 days of the patient being discharged.

HEALTH CARE RECORDS – DOCUMENTATION AND MANAGEMENT
(PD2012_069)

PD2012_069 rescinds PD2005_004, PD2005_015 & PD2005_127.

PURPOSE
The purpose of this policy is to:
- Define the requirements for the documentation and management of health care records across public health organisations (PHOs) in the NSW public health system.
- Ensure that high standards for documentation and management of health care records are maintained consistent with common law, legislative, ethical and current best practice requirements.

MANDATORY REQUIREMENTS

Documentation in health care records must provide an accurate description of each patient/client's episodes of care or contact with health care personnel. The policy requires that a health care record is available for every patient/client to assist with assessment and treatment, continuity of care, clinical handover, patient safety and clinical quality improvement, education, research, evaluation, medico-legal, funding and statutory requirements.

Health care record management practices must comply with this policy.

IMPLEMENTATION
Chief Executives are responsible for:
- Establishing mechanisms to ensure compliance with the requirements of this policy.
- Ensuring health care personnel are advised that compliance with this policy is part of their patient/client care responsibilities.
- Ensuring line managers are advised that they are accountable for implementation of this policy.
- Ensuring implementation of a framework for auditing of health care records and reporting of results.
- Ensuring health care records are audited and results reported within the PHO.

Facility/service managers are responsible for:
- Ensuring the requirements of this policy are disseminated and implemented in their hospital/ department/service.
- Ensuring health care personnel within their facility/service have timely access to paper based and electronic health care records.
- Monitoring compliance with this policy, including health care record audit programs, and acting on the audit results.

Health care personnel are responsible for:
- Maintaining their knowledge, documentation and management of health care records consistent with the requirements of this policy.
- Ensuring they are aware of current information about the patient/client under their care including where appropriate reviewing entries in the health record.

1. OVERVIEW

1.1 Introduction

This standard sets out the requirements for documentation and management for all models of health care records within the NSW public health system. Health care records promote patient safety, continuity of care across time and care settings, and support the transfer of information when the care of a patient/client is transferred eg. at clinical handover, during escalation of care for a deteriorating patient and transfer of a patient/client between settings.

1.2 Key definitions

Attending medical practitioner	Visiting Medical Officer or Staff Specialist responsible for the clinical care of the patient for that episode of care.
Approved clinician	A clinician, other than a medical practitioner, approved to order tests eg Nurse Practitioner.
Health care personnel	A person authorised to provide assessment, diagnosis, treatment/care, observation, health evaluation or professional advice or those personnel who have access to the patient/client health care records on behalf of the NSW public health system to facilitate patient/client care. Health care personnel include clinicians (and students) and clinical support staff. Clinicians include registered health practitioners[83] and other including Assistants in Nursing, social workers, dieticians, occupational therapists and Aboriginal Health Workers. Clinical support staff include Health Information Managers, Clinical Governance and Patient Safety staff, ward clerks, health care interpreters and accredited chaplains.
Health care record	The main purpose of a health care record is to provide a means of communication to facilitate the safe care and treatment of a patient/client. A health care record is the primary repository of information including medical and therapeutic treatment and intervention for the health and wellbeing of the patient/client during an episode of care and informs care in future episodes. The health care record is a documented account of a patient/client's history of illness; health care plan/s; health investigation and evaluation; diagnosis; care; treatment; progress and health outcome for each health service intervention or interaction. The health care record may also be used for communication with external health care providers, and statutory and regulatory bodies, in addition to facilitating patient safety improvements; investigation of complaints; planning, audit activities; research (subject to ethics committee approval, as required); education; financial reimbursement and public health. The record may become an important piece of evidence in protecting the legal interests of the patient/client, health care personnel, other personnel or PHO. The health care record may be paper, electronic form or in both. Where a health care record exists in both paper and electronic form this is referred to as a hybrid record. Where PHOs maintain a hybrid record health care personnel must at all times have access to information that is included in each part. This policy applies to health care records that are the property if, and maintained by, PHOs, including health care records of private patients seen in the PHO. The policy does not apply to records that may be maintained by patients/clients and records that may be maintained by clinicians in respect of private patients seen in private rooms.

[83] Health practitioners registered under the following National Boards - Chiropractic, Dental, Medical, Nursing and Midwifery, Optometry, Osteopathy, Pharmacy, Physiotherapy, Podiatry and Psychology - are required to comply with the health care records section of their relevant code of conduct/guidelines/competency standards. On 1 July 2012 the following healthcare personnel will be represented by a national registration board - Aboriginal and Torres Strait Islander health practitioners, Chinese medicine practitioners, medical radiation practitioners, and occupational therapists http://www.ahpra.gov.au/.

Must	Indicates a mandatory action required by a NSW Health policy directive, law or industrial instrument.
Medical practitioner	A person registered under the Health Practitioner Regulation National Law (NSW) in the medical profession.
Public health organisation (PHO)	a) Local health district. b) Statutory health corporation that provides patient/client services. c) Affiliated health organisation in respect of its recognised establishment or recognised service that provides patient/client services, or d) Ambulance Service of NSW.
Should	Indicates an action that ought to be followed unless there are justifiable reasons for taking a different course of action.

1.3 Privacy and confidentiality

All information in a patient/client's health care record is confidential and subject to prevailing privacy laws and policies. Health care records contain health information which is protected under legislation.[84] The requirements of the legislation, including the Privacy Principles, are explained in plain English in the NSW Health Privacy Manual.[85] Health care personnel should only access a health care record and use or disclose information contained in the record when it is directly related to their duties and is essential for the fulfilment of those duties, or as provided for under relevant legislation.

1.4 Auditing

Health care records across all settings and clinical areas must be audited for compliance with this policy. PHOs must establish a framework and schedule for auditing of records and approve and designate audit tools and processes.

Clinical audits of documentation in health care records should involve a team based approach with the clinical team consisting of medical practitioners, nurses, midwives, allied health practitioners and other health care personnel, as appropriate.

Health care record audit results should be:
a) Provided to relevant clinical areas and health care personnel.
b) Included in PHO performance reports.
c) Referred to PHO quality committees to facilitate quality improvement.

1.5 Education

PHOs must establish a framework for the development and delivery of suitable education on documentation and management of health care records. All health care personnel who document or manage health care records must be provided with appropriate orientation and ongoing education on the documentation and management of health care records.

The content and delivery of education programs should be informed by health care record audits. The results of such audits should be used to target problem areas relating to particular health care personnel groups or facets of documentation and management.

Specific education must be conducted for the introduction of any new complex health care record forms and for changes in documentation models.

[84] Health Records and Information Privacy Act 2002 http://www.legislation.nsw.gov.au/maintop/view/inforce/act+71+2002+cd+0+N
[85] Privacy Manual for Health Information (March 2015)

2. DOCUMENTATION

2.1 Identification on every page/screen[86]

The following items must appear **on every page of the health care record**, or on each screen of an electronic record (with the exception of pop up screens where the identifying details remain visible behind):

a) Unique identifier (eg. Unique Patient Identifier, Medical Record Number).
b) Patient/client's family name and given name/s.
c) Date of birth (or gestational age/age if date of birth is estimated).
d) Sex. The exception is ObstetriX records where sex of the mother is not recorded.

2.2 Standards for documentation[87]

Documentation in health care records must comply with the following:

a) Be clear and accurate.

b) Legible and in English.

c) Use approved abbreviations and symbols.

d) Written in dark ink that is readily reproducible, legible, and difficult to erase and write over for paper based records.

e) Time of entry (using a 24-hour clock - hhmm).

f) Date of entry (using ddmmyy or ddmmyyyy).

g) Signed by the author, and include their printed name and designation. In a computerised system, this will require the use of an appropriate identification system eg. electronic signature.

h) Entries by students involved in the care and treatment of a patient/client must be co-signed by the student's supervising clinician.[88]

i) Entries by different professional groups are integrated ie. there are not separate sections for each professional group.

j) Be accurate statements of clinical interactions between the patient/client and their significant others, and the health service relating to assessment; diagnosis; care planning; management/ care/treatment/services provided and response/outcomes; professional advice sought and provided; observation/s taken and results.

k) Be sufficiently clear, structured and detailed to enable other members of the health care team to assume care of the patient/client or to provide ongoing service at any time.

l) Written in an objective way and not include demeaning or derogatory remarks.

m) Distinguish between what was observed or performed, what was reported by others as happening and/or professional opinion.

n) Made at the time of an event or as soon as possible afterwards. The time of writing must be distinguished from the time of an incident, event or observation being reported.

[86] PD2009_072 State Health Forms http://www.health.nsw.gov.au/policies/pd/2009/PD2009_072.html
[87] Each registered health practitioner is required to comply with the health care records section of the code of conduct/guidelines/competency standards under their relevant National Board
[88] PD2005_548 Student Training and Rights of Patients http://www.health.nsw.gov.au/policies/pd/2005/PD2005_548.html and GL2005_034 Reports - Countersigning Enrolled Nurse, Trainee Enrolled Nurse or Assistant in Nursing Patient Care http://www.health.nsw.gov.au/policies/GL/2005/GL2005_034.html

o) Sequential - where lines are left between entries they must be ruled across to indicate they are not left for later entries and to reflect the sequential and contemporaneous nature of all entries.

p) Be relevant to that patient/client.

q) Only include personal information about other people when relevant and necessary for the care and treatment of the patient/client.

r) **Addendum** - if an entry omits details any additional details must be documented next to the heading 'Addendum', including the date and time of the omitted event and the date and time of the addendum.

For hardcopy records, addendums must be appropriately integrated within the record and not documented on additional papers and/or attached to existing forms.

s) **Written in error** - all errors are must be appropriately corrected.
No alteration and correction of records is to render information in the records illegible.

An original incorrect entry must remain readable ie. do not overwrite incorrect entries, do not use correction fluid. An accepted method of correction is to draw a line through the incorrect entry or 'strikethrough' text in electronic records; document "written in error", followed by the author's printed name, signature, designation and date/time of correction.

For electronic records the history of audited changes must be retained and the replacement note linked to the note flagged as "written in error". This provides the viewer with both the erroneous record and the corrected record.

2.3 Documentation by medical practitioners

Documentation by medical practitioners must include the following:

a) Medical history, evidence of physical examination.

b) Diagnosis/es (as a minimum a provisional diagnosis), investigations, treatment, procedures/ interventions and progress for each treatment episode.

A principal diagnosis must be reported for every episode of admitted patient care.

c) Medical management plan.

d) Where an invasive procedure is performed and/or an anaesthetic is administered, a record of the procedure including completion of all required procedural checklists. Where a general anaesthetic is administered, a record of examination by a medical practitioner prior to the procedure is also required.

e) Comprehensive completion of all patient/client care forms.

f) A copy of certificates, such as Sick and Workers Compensation Certificates, provided to patients/clients must be retained in the patient/client's health care record.

2.3.1 Attending Medical Practitioner

The Attending Medical Practitioner (AMP) is responsible for the clinical care of the patient/client for that episode of care and is responsible for ensuring that adequate standards of medical documentation are maintained for each patient/client under their care.

When documentation is delegated to a medical practitioner e.g. Intern, Resident, Registrar, the AMP remains responsible for ensuring documentation is completed to an appropriate standard that would satisfy their professional obligations.

The AMP should review the preceding medical entries and make a written entry in the health care record (print name, signature, designation and date/time) to confirm they have been read at the same time as they are reviewing the medical management plan for the patient/client to ensure it remains current and clinically appropriate, consistent with the AMP's duty of care to the patient/client.

2.4 Documentation by nurses and midwives

Documentation by nurses and midwives must include the following:

a) Care/treatment plan, including risk assessments with associated interventions.

b) Comprehensive completion of all patient client care forms.

c) Any significant change in the patient/client's status with the onset of new signs and symptoms recorded.

d) If a change in the patient/client's status has been reported to the responsible medical practitioner documentation of the name of the medical practitioner and the date and time that the change was reported to him her.

e) Documentation of medication orders received verbally, by telephone/electronic communication including the prescriber's name, designation and date/time.

2.5 Frequency of documentation

The frequency of documentation entries should conform to the following as minimum requirements.

2.5.1 Acute Care Patient/clients

a) Registered Nurse/Midwife, Enrolled/Endorsed Nurse should make an entry in the patient/ client's health care record a minimum of once a shift. An entry by an Assistant in Nursing should **not** be the only entry for a shift.

   Entries should reflect in a timely way the level of assessment and intervention. The results of significant diagnostic investigations and significant changes to the patient/client's condition and/or treatment should be documented as these occur.

b) Medical practitioners should make an entry in the health care record at the time of events, or as soon as possible afterwards, including when reviewing the patient/client.[89]

c) Other health care personnel should make entries to reflect their level of assessment and intervention consistent with the medical management plan.

2.5.2 Long Stay or Residential Patients/Clients

Depending on the health care setting and the length of stay (or expected length of stay) of the patient/ client, health care personnel should make an entry at least weekly in the health care record particularly when warranted by the patient's medical condition or frailty.

Additional entries should be made to reflect changes in the patient/client status, condition and/or treatment or care plan as these occur.

2.5.3 Non-Admitted Patient/Clients

An entry must be made in the health care record for each patient/client attendance (including video conference sessions) and for failures to attend.

[89] Medical Board of Australia. Good Medical Practice: A Code of Conduct http://www.medicalboard.gov.au/Codes-Guidelines-Policies.aspx

Entries should reflect the level of assessment and intervention. The results of significant diagnostic investigations and significant changes to the patient/client's condition and/or treatment should be documented.

Attendance of individual patient/clients at sessions of a formal multiple session group program should be noted. Such attendances may be documented in an attendance register or scheduling system rather than the patient/client's health care record. Where a patient/client receives specific individual care or treatment in addition to the group session interaction, this care or treatment should be documented in their health care record.

2.6 Alerts and allergies

Clinicians must flag issues that require particular attention or pose a threat to the patient/client, staff or others including:

a) Allergies/sensitivities or adverse reactions, and the known consequence.

b) Infection prevention and control risks.

c) Behaviour issues that may pose a risk to themselves or others.

d) Child protection/well being matters including

   i. alerts and flags for High Risk Birth Alerts or prenatal reports
   ii. children at risk of significant harm
   iii. where NSW Police or the Department of Family and Community Services have issued a general alert to a PHO.

e) Where patients/clients have similar names and other demographic details.

PHOs must implement systems for the identification of such alerts and allergies. If a label is used on the outside folder of a paper based health care record this does not negate the need for documentation in the health care record of the alert/allergy, and known consequence.

Any such issue should be 'flagged' or recorded conspicuously on appropriate forms, screens or locations within the health care record. Where alerts relate to behaviour issues or child protection matters the alert should be discreet to ensure the privacy and safety of the patient/client, staff or others.

These flags, especially where codes or abbreviations are used, must be apparent to and easily understood by health care personnel; must not be ambiguous; and should be standardised within the PHO.

A flag should be reviewed at each admission. When alerts and allergies are no longer current this must be reflected in the health care record and inactivated where possible.

2.7 Labels

Non-permanent adhesive labels should be avoided. Where considered essential the label must be relevant to the patient/client and placed so that all parts of the health care record are able to be read and patient/client privacy maintained. State approved labels must be used.

2.8 Tests - requests and results

The health care record must document pathology, radiology and other tests ordered, the indication and the result.

When tests are ordered the name of the ordering medical practitioner/approved clinician and their contact number must be clearly printed (if written) or entered (if computerised) on the request form.

Pathology, radiology and other test results must be followed up and reviewed with notation as to action required. The results must be endorsed by the receiving medical practitioner/approved clinician, with endorsement involving the name, signature, designation of the medical practitioner/ approved clinician, and date/time.

PHOs must develop local procedures, including steps to be taken, when:
a) Relevant details on the request form are incomplete or illegible.
b) The ordering medical practitioner/approved clinician is not on duty or contactable.

Critical/unexpected/abnormal results should be documented in the patient/client's health care record by the responsible medical practitioner/approved clinician as soon as practicable and any resultant change in care/treatment plans documented.

2.9 Patient/client clinical incidents

All actual clinical incidents must be documented in the patient/client's health care record.[90]

Staff must document in the health care record.
a) Incident Information Management System (IIMS) identification number.
b) Clinically relevant information about the incident.
c) Interactions related to open disclosure processes.[91]

2.10 Complaints

Complaint records are not to be kept with the patient's health care record.[92]

2.11 Emergency Department records

Emergency Department records must include the following:

a) Date and time triaged including triage score.

b) Presenting problem and triage assessment.

c) Date and time seen by a medical practitioner, other clinicians such as a Clinical Initiatives Nurse, Nurse Practitioner, nursing, midwifery and allied health staff.

d) Medical, nursing, midwifery and allied health assessment.

e) Pathology, radiology and other tests ordered. Pathology, radiology and other test results must be followed up and reviewed with notation as to action required.

f) Description of critical/unexpected/abnormal pathology, radiology and other test results. If the patient/client has left the Emergency Department and not been admitted, document the steps taken to contact the patient/client or their carer if the test results indicate that urgent treatment/ care is required.

[90] PD2014_004 Incident Management Policy http://www.health.nsw.gov.au/policies/pd/2014/PD2014_004.html
[91] PD2014_028 Open Disclosure Polocy http://www.health.nsw.gov.au/policies/pd/2014/PD2014_028.html
[92] Complaint Management Policy (section 7.9) http://www.health.nsw.gov.au/policies/pd/2006/PD2006_073.html

g) Details of treatment.

h) Follow up treatment where applicable.

i) Transfer of care date and time, destination (eg. home, other level of health care) method and whether accompanied.

2.12 Anaesthetic reports

Anaesthetic reports must include the following:

a) Pre-operative assessment, including patient anaesthetic history.

b) Risk-rating eg. American Society of Anaesthesiologists (ASA) score.

c) Date and time anaesthetic commenced and completed.

d) Anaesthesia information and management ie. medications, gases, type of anaesthetic.

e) NSW safety checklists including patient assessment and equipment checklists consistent with Australian and New Zealand College of Anaesthetists requirements.

f) Operative note/monitor results.

g) Post-operative notes/orders.

2.13 Operation/procedure reports

Operation/procedure reports must include the following:

a) Date of operation/procedure.

b) Pre-operative and post-operative diagnosis.

c) Indication for operation/procedure.

d) Procedure safety checklist.

e) Surgical operation/procedure performed.

f) Personnel involved in performing the operation/procedure.

g) Outline of the method of surgery/procedure.

h) Product/device inserted and batch number.

i) Changes to, or deviations from, the planned operation/procedure, including any adverse events that occurred.

k) Tissue removed.

l) Pathology ordered on specimens.

m) Post-operative orders.

2.14 Telephone/electronic consultation with patient/clients

When clinical information is provided to a patient/client, or their carer/guardian/advocate, the consultation must be documented in the health care record. The identification of the caller must be documented.

Where the caller is not the patient/client, or their carer/guardian/advocate obtain consent from the patient/client, or their carer/guardian/advocate prior to the consultation. Document the:

a) Caller's name,
b) Relationship to the patient/client, and
c) That the patient/client, or their carer/guardian/advocate has consented to the caller seeking clinical information about the patient/client

in the patient/client's health care record.

2.15 Telephone/electronic consultation between clinicians

Where a clinician involved in the care and treatment of a patient/client formally consults another clinician, via telephone/electronic means, about the patient/client and the consulted clinician provides advice, direction or action, that advice, direction or action must be documented in the health care record by the clinician seeking the advice. The name and designation of the consulted clinician, and the date/time of the consultation must also be documented as soon as practical following consultation with the other clinician and in a manner as to ensure continuity of care for patients.

2.16 Leave taken by patients/clients

Any leave taken by the patient/client should be documented in their health care record with the date/ time the patient/client left and returned. The patient/client should be assessed before proceeding on leave and the outcome of that assessment documented in the health care record, together with the documented approval of the AMP noting the assessment.

2.17 Leaving against medical advice

A patient/client who decides to leave the health service/program against medical advice must be asked to sign a form to that effect with the form filed in the patient/client's health care record. If the patient/client refuses to sign the form this must be documented in the health care record, including any advice provided.

Examples of advice that could be provided to the patient/client include:

a) The medical consequences of the patient's decision, including the potential consequences of no treatment.

b) The provision or offering of an outpatient management plan and follow-up that is acceptable and relevant to the patient.

c) Under what circumstances the patient should return, including an assurance that they can elect to receive treatment again without any prejudice.

3 MANAGEMENT

3.1 Responsibility and accountability

The Chief Executive of the PHO must comply with the State Records Act and its regulation in respect of health care records.[93]

Responsibility for the maintenance of appropriate health care records must be included in the terms and conditions of appointment (including position descriptions) for all health care personnel as defined in this policy.

Documentation must be included as a standing item in annual performance reviews of clinicians. Failure to maintain adequate health care records will be managed in accordance with current NSW Health policies and guidelines for managing potential misconduct.

3.2 Individual health care record

An individual health care record with a unique identifier (eg unique patient identifier, medical record number) must be created for each patient/client who receives health care. Every live or still born baby must be allocated a unique identifier that is different to the mother.

Where multiple patient identifiers exist for the same patient/client within a PHO there must be processes established for their reconciliation and linkage, with the ability to audit those processes.

A reference notation should be placed on the health care record to identify any relevant other documents that relate to the patient's health care. Index or patient administration systems must reference the existence of satellite/decentralised health care records that address a specific issue and that are kept separate from the principal health care record. Due to the nature of the information contained in sexual assault records these must be maintained separately from the principal health care record and be kept secure at all times; as should child protection/wellbeing and genetics records.

Staff screening and vaccination records are considered as personnel rather than health care records and must be maintained separately.

3.3 Access

Health care records should be available at the point of care or service delivery. Health care records must not be removed from the campus unless prior arrangements have been made with the PHO eg. required for a home visit, required under subpoena.

Health care records are only accessible to:[94]

b) Health care personnel currently providing care/treatment to the patient/client.
c) Staff involved in patient safety, the investigation of complaints, audit activities or research (subject to ethics committee approval, as required).
c) Staff involved in urgent public health investigations for protecting public/population health, consistent with relevant legislation.[95]

[93] State Records Act 1998 http://www.legislation.nsw.gov.au/maintop/view/inforce/act+17+1998+cd+0+N
[94] Privacy Manual for Health Information (March 2015)
Health Records and Information Privacy Act 2002 http://www.legislation.nsw.gov.au/maintop/view/inforce/act+71+2002+cd+0+N,
Government Information (Public Access) Act 2009 http://www.legislation.nsw.gov.au/maintop/view/inforce/act+52+2009+cd+0+N
[95] Public Health Act http://www.legislation.nsw.gov.au/

d) Patient/client to whom the record relates, or their authorised agent, based on a case by case basis in accordance with health service release of information policies and privacy laws.
e) Other personnel/organisations/individuals in accordance with a court subpoena, statutory authority, valid search warrant, coronial summons, or other lawful order authorised by legislation, common law or NSW Health policy.

All requests for information, that is contained in a patient/client's health care record, from a third/ external party should be handled by appropriately qualified and experienced health care personnel, such as Health Information Managers, due to the sensitive nature of health care records; the special terminology used within them; and regulatory requirements around access to, and disclosure of, information.

3.4 Ownership

The health care record is the property of the PHO providing care, and not individual health care personnel or the patient/client.

Where shared care models or arrangements exist for clinicians to treat private patient/clients within PHO facilities/settings, responsibility for the management of those health care records must be included in the terms of the arrangement between the PHO and the clinician.

3.5 Retention and durability

Health care records must be maintained in a retrievable and readable state for their minimum required retention period.[96]

Entries should not fade, be erased or deleted over time. The use of thermal papers, which fade over time, should be restricted to those clinical documents where no other suitable paper or electronic medium is available e.g. electrocardiographs, cardiotocographs.

Electronic records must be accessible over time, regardless of software or hardware changes, capable of being reproduced on paper where appropriate, and have regular adequate backups.

3.6 Storage and security

The *Health Records and Information Privacy Act 2002* establishes statutory requirements for the storage and security of health care records, which are also included in the NSW Health Privacy Manual. A summary of these requirements is provided below. However, the Privacy Manual should be consulted for further detail in this area.

Personal health information, including healthcare records, must have appropriate security safeguards in place to prevent unauthorised use, disclosure, loss or other misuse. For example, all records containing personal health information should be kept in lockable storage or secure access areas when not in use.

Control over the movement of paper based health care records is important. A tracking system is required to facilitate prompt retrieval to support patient/client care and treatment and to preserve privacy.

[96] Patient Matters Manual (**http://www.health.nsw.gov.au/policies/manuals/Pages/patient-matters-manual.aspx**) and patient/client records requirements at State Records (**http://www.records.nsw.gov.au/recordkeeping/government-recordkeeping-manual/rules/general-retention-and-disposal-authorities/general-retention-and-disposal-authorities-1/?searchterm=GDA**)

A secure physical and electronic environment should be maintained for all data held on computer systems by the use of authorised passwords, screen savers and audit trails. If left unattended, no personal health information should be left on the screen. Screen savers and passwords should be used where possible to reduce the chance of casual observation. Consideration may be given to providing staff with different levels of access to electronic records where appropriate (i.e. full, partial or no access).

Details of the roles and responsibilities of staff, including system administrators and IT technical and support staff, concerning the protection of health care records held on electronic information systems are given in the NSW Health Electronic Information Security Policy
http://www.health.nsw.gov.au/policies/pd/2013/PD2013_033.html

3.7 Disposal[97]

Health care records, both paper based and electronic, must be disposed of in a manner that will preserve the privacy and confidentiality of any information they contain.

Disposal of data records should be done in such as way as to render them unreadable and leave them in a form from which they cannot be reconstructed in whole or in part.

Paper records containing personal health information should be disposed of by shredding, pulping or burning. Where large volumes of paper are involved, specialised services for the safe disposal of confidential material should be employed.

The disposal of health care records must be documented in the PHO's Patient Administration System and undertaken in accordance with the relevant State General Disposal Authority.

[97] Patient Matters Manual (**http://www.health.nsw.gov.au/policies/manuals/Pages/patient-matters-manual.aspx**) and patient/client records requirements at State Records (**http://www.records.nsw.gov.au/recordkeeping/government-recordkeeping-manual/rules/general-retention-and-disposal-authorities/general-retention-and-disposal-authorities-1/?searchterm=GDA**)

4 IMPLEMENTATION SELF ASSESSMENT CHECKLIST

An Implementation Self Assessment Checklist is provided to support implementation of this policy.

Requirement: Self Assessment:

	Nil	In development	Partial implementation	Mature
A. STRATEGIC FUNDAMENTALS				
PHO has documented processes to manage health care records				
PHO uses an approved abbreviation list				
There are resources and support to implement the Health Care Records policy and regular monitoring of progress by a responsible officer				
Key performance indicators are developed to monitor and measure implementation of the Health Care Records policy in the PHO Examples of performance measures: 1 Patient identification is on every page of the health care record or on each screen of the electronic record. 2 Handwritten entries are legible to a reader other than the author.				
B. INTEGRATION INTO NORMAL BUSINESS SYSTEMS				
Responsibility and accountability for documentation and management of health care records is clearly stated in position descriptions and incorporated into performance review for all relevant health care personnel.				
The design, approval and implementation of health care records forms (including electronic systems) is consistent with state policies and procedures.				

9. HEALTH RECORDS AND INFORMATION 9.161

Requirement: Self Assessment:

	Nil	In development	Partial implementation	Mature
C. ORGANISATIONAL IMPLEMENTATION				
A schedule is in place for auditing of health care records across clinical settings. This should include both record completeness and clinical audits.				
All clinical areas are audited for compliance with the Health Care Record policy according to the schedule noted above.				
Results and analysis of health care record audits are provided to clinicians and managers, and are used to inform remedial quality improvement activities.				
Results and analysis of health care record audits are used to inform education on clinical documentation.				
There is a process for recognition of excellence in the documentation and management of health care records.				
Health care records key performance indicators are monitored at ward/unit, hospital/service and PHO level and benchmarked with appropriate peers.				

NOTIFICATION OF ACUTE RHEUMATIC FEVER AND RHEUMATIC HEART DISEASE – THE NSW PUBLIC HEALTH ACT 2010 (IB2015_057)

PURPOSE

This Information Bulletin provides guidance on the addition of Acute Rheumatic Fever (ARF) and Rheumatic Heart Disease (RHD) to the list of medical conditions in Schedule 1 of the *NSW Public Health Act*, and to the list of notifiable diseases in Schedule 2 of the Act.

Under the provisions of the *Public Health Act 2010* and the *Public Health Regulation 2012*, doctors, hospital chief executive officers (or general managers), pathology laboratories, directors of child care centres and school principals are required to notify certain medical conditions listed on the NSW Ministry of Health website.

KEY INFORMATION

On 2 October 2015 the *NSW Public Health Act 2010* was amended to add ARF and RHD in a person under the age of 35 to:

a) The list of medical conditions in Schedule 1 to that Act:
   i. That must be notified by medical practitioners to the Secretary of the NSW Ministry of Health,

and

b) The list of notifiable diseases in Schedule 2 to that Act:
   i. That must be notified by health practitioners providing care in hospitals to the chief executive officer of the hospital concerned,

and
   ii. That must be notified by the chief executive officer of a hospital to the Secretary of the NSW Ministry of Health.

NOTIFICATION MECHANISMS

Information on the notification of infectious diseases under the *Public Health Act 2010* is detailed in the Information Bulletin IB2013_010.

Infectious disease notifications should be directed to the local Public Health Unit, and should be initiated as soon as possible within 24 hours of diagnosis.

In order to protect patient confidentiality, notifications must not be made by facsimile machine except in exceptional circumstances and when confidentiality is ensured.

Disease notification guidelines and notification forms for notifiers are available at:
www.health.nsw.gov.au/Infectious/Pages/notification.aspx

NON-ADMITTED PATIENT DATA COLLECTION: CLASSIFICATION AND CODE STANDARDS FOR REPORTING SERVICES PROVIDED FROM 1 JULY 2016 IN A WEBNAP EXTRACT FORMAT (IB2016_039)

PURPOSE

The purpose of this Information Bulletin is to inform NSW Health service providers and source system administrators of changes to the classification and code set standard for reporting non-admitted patient service provided from 1 July 2016.

KEY INFORMATION

Due Dates for Reporting

Non-admitted patient activity data must be submitted and of acceptable quality by the 10th calendar day of the month after the month the service was delivered.

Patient or summary level non-admitted patient activity reporting

Patient level non-admitted patient activity is to be reported for in scope activity.

Where the requirement to report patient level activity data cannot be met summary level data must be reported.

The following services are only required to report non-admitted patient activity at the summary level.

1. Group immunisation services (Service Type 023 Immunisation – On Mass (no patient level data)
2. Group diagnostic screening services
3. Needle exchange services and supervised injecting room services (including service units classified to Service Unit Establishment Type 11.04 Needle Exchange Allied Health / CNS Unit).
4. Crisis line counselling telephone services.

This data is to be reported by WebNAP, or by mLoad when that capability is provided.

Summary level must not be reported for any service unit reporting activity at the patient level.

There is no longer a requirement to advise the Executive Director, Health System Information and Performance Reporting Branch of the Local Health Districts (LHDs) and Specialist Health Networks (SHNs) intention to decommission summary level reporting for those service units reporting at the patient level.

Reporting of Services with Multiple Providers

When reporting non-admitted patient services in a WebNAP extract via mLoad each individual service provider should be reported, even if two or more providers have the same provider type code.

Occasion of Service Record Identifier

Each occasion of service must be reported with a unique record identifier in the 'Service Event Record ID' field. When resubmitting an occasion of service record the same record identifier must be reported so that the original record is identified and updated.

Where a record identifier is not unique within a single submission to EDWARD, mLoad will prevent the entire file from loading.

Data element classifications subject to change

The requirements for reporting non-admitted patient activity to the Non-Admitted Patient Data

Collection will change for the following data elements:

1. Provider Type
2. Setting Type
3. Financial group.

The changes are of the following type:

1. Some new categories will become effective from 1 July 2016
2. Some existing categories will expire on 30 June 2016
3. Some continuing categories have descriptive label changes.

Implementation

The classification changes must be implemented for the reporting of non-admitted patient services provided on or after 1 July 2016 where they are reported via a WebNAP extract format.

These changes will require LHDs / SHNs to:

- Modify local source system classifications
- Map the local source system categories to the appropriate WebNAP alias code values
- Modify WebNAP Service Options for the service units reporting summary level data and impacted by the changed classifications

This involves:

  - End dating existing service options containing expired reference codes effective 30 June 2016
  - Establishment of new service options containing the new reference codes effective from 1 July 2016.

LHD / SHNs must advise and instruct their source system vendors of the changed requirements and any subsequent need to modify systems. Where a source system is shared between multiple LHDs / SHNs; are compliant with a State Based Build; and / or are subject to application support services provided by eHealth NSW, it is the responsibility of each LHD / SHN to ensure the technical implementation of the modified reporting requirements are raised through the appropriate application support mechanisms. This includes:

- The LHD / SHN Application Advisory Group (AAG) representative ensuring that the change requirements are on the AAG meeting agenda, discussed at the AAG meetings and are approved within a time frame that will enable the implementation due date to be met.
- Directing and authorising eHealth NSW to make the application build change by raising the request for change on the State-wide Service Desk and tracking the change through to its delivery.

Clarification Advice

The NSW Ministry of Health will provide clarification advice regarding the changed reporting requirements outlined in the attachments. Requests for advice should be directed to the Health System Information and Performance Reporting Branch, NSW Ministry of Health.

ATTACHMENT 1

Non-admitted Patient Activity Reporting – Changes to Classification and Code Standards for Reporting Services Provided from 1 July 2016 via a WebNAP Extract Format.
This attachment outlines changes to Non-admitted Patient Data Collection (NAPDC) data elements domains, in scope of the existing WebNAP extract, for services provided on or after 1 July 2016.

The final classifications for each data element reported in a code format, incorporating the changes applicable from 1 July 2016, are provided Attachment 2.

The NAPDC WebNAP Data Dictionary in HIRD provides detailed information pertaining to the concepts and classification, including the new and changed category definitions. Links to this data dictionary are provided on the following NSW Ministry of Health Intranet page:

http://internal.health.nsw.gov.au/data/collections/webnap/webnap-data-dictionary-patient-v6.html

ATTACHMENT 2

Non-admitted Patient Activity Reporting – Classification and Code Standards for Reporting Services Provided from 1 July 2016 via a WebNAP Extract Format.

This document provides the NSW Health State classification and code standards applicable to services provided from 1 July 2016 for data elements in scope of the Non-admitted Patient Data Collection Core Minimum Data Set and reported via the legacy WebNAP patient level extract.

The NSW Health State classification and code standards applicable to services reported in the EDWARD extract format are provided at the following NSW Ministry of Health intranet page:

http://internal.health.nsw.gov.au/data/edward/edward-metadata-data-stream-service-event-nap-flat-file-format.html

NON-ADMITTED PATIENT DATA COLLECTION TRANSITION FROM WEBNAP TO EDWARD REPORTING (GL2015_012)

PURPOSE

The purpose of this Guideline is to advise NSW Health non-admitted patient service providers and non-admitted patient activity source system support staff of the changes in requirements involved in the transition from reporting via WebNAP to reporting via the EDWARD.

An understanding of these differences, and the three phases of implementation, is required to reconfigure source system builds and patient level activity extracts, and redesign non-admitted patient activity reporting business processes.

KEY PRINCIPLES

In line with NSW Health's strategic direction and the significantly increased volumes of non-admitted patient services being reported at the patient level by NSW Health services the Non-Admitted Patient Data Collection will transition to be reported via EDWARD rather than the interim system WebNAP.

The migration of the data collection to EDWARD will have significant benefits for Local Health Districts (LHDs) / Specialist Health Networks (SHNs) and other NSW Health agencies. LHDs / SHNs should expect higher data availability, more efficient data loading and resubmission processes, significantly improved data error reporting functionality and appropriately secured access to activity data.

When reported via EDWARD the non-admitted patient, admitted patient and emergency department activity data will be automatically allocated the appropriate National Weighed Activity Unit (NWAU) and integrated into a single data mart that supports full patient journey analysis utilising the Enterprise Patient Registry unique identifier.

USE OF THE GUIDELINE

In order to minimise the transition burden, requirements have been prioritised across three phases:

- **Phase 1**: Report current scope via EDWARD and decommission WebNAP
- **Phase 2**: Convert source system extracts and classifications to the EDWARD format
- **Phase 3**: Integrate additional reporting requirements for specific clinical streams

The EDWARD Business Implementation (EBI) Program collaborating with the NSW Ministry of Health's Health Systems Information and Performance Reporting (HSIPR) Branch will establish a small project team to support transition, testing and address queries as they arise during the migration period.

Phase 1

Implementation of phase 1 requires LHDs/SHNs to load WebNAP patient level and summary level extracts into EDWARD and to cease reporting to WebNAP.

To support the transition to EDWARD reporting during Phases 1 and 2, a file upload, conversion and transfer tool, the EDWARD mLoad Tool, will be available for LHDs/SHNs to upload patient level and summary level data extracts from source systems in either the WebNAP extract format, or the EDWARD extract format.

The tool will apply the necessary file format conversions to WebNAP extracts compliant with the 2015/16 WebNAP reporting requirements and file format. It will also produce a container header file (based on user inputs) for both WebNAP and EDWARD flat file formats, and transfer files to the EDWARD drop zone where they will be automatically loaded into EDWARD.

During this phase LHDs / SHNs:

1. Must build EDWARD extracts for non-admitted patient source systems that are not yet reporting at the patient level
2. Must commence the reconfiguration of WebNAP extracts such that the source system can report activity directly in the EDWARD extract format
3. May cease reporting summary level data for services reporting at the patient level once reporting through the EDWARD mLoad Tool
4. May commence (or fully implement any) transition steps outlined in later phases.

Phase 1 must be completed by **30 June 2016**, to enable the decommissioning of WebNAP.

Phase 2

Implementation of Phase 2 requires LHDs / SHNs to complete the reconfiguration of WebNAP source system extracts into the EDWARD extract format and source systems to be fully aligned with the EDWARD classification standards.

During this phase any changes effective from 1 July 2016 will also need to be incorporated into the EDWARD extracts.

During this phase LHDs/SHNs may implement Phase 3 implementation steps.

Phase 2 must be completed **by 30 June 2017**, to enable the decommissioning of the WebNAP patient level file conversion functionality, compliance with 2016/17 reporting requirements and to establish the foundations required for implementation of Phase 3.

Phase 3

Phase 3 involves reporting the additional data elements set aside in the EDWARD extract file format for the integration of other non-admitted patient data collections for specific clinical streams. It will involve decommissioning the legacy extracts and legacy data repositories (such as HIE and other disparate databases).

This phase may only impact selected source systems. For example, radiotherapy sources system would add data elements required for the integration of radiotherapy waiting times and non-admitted patient cancer notifications, while source systems used by Hepatitis, HIV/AIDS and sexually transmissible diseases services would add data elements pertaining to communicable diseases.

Phase 3 is expected to be completed **by 30 June 2018**, to enable the decommissioning of the HIE and other legacy data repositories and to establish a single comprehensive non-admitted patient data collection.

FURTHER INFORMATION

The NSW Ministry of Health will provide advice and clarifications regarding the requirements for reporting non-admitted patient activity via EDWARD. Requests for advice should be directed to the Health System Information & Performance Reporting Branch, NSW Ministry of Health.

RIGHT TO ACCESS MEDICAL RECORDS BY LEGAL REPRESENTATIVES – MENTAL HEALTH REVIEW TRIBUNAL HEARINGS (IB2018_019)

PURPOSE

The purpose of this information bulletin is to inform Local Health Districts/Specialty Networks of the right of a patient's legal representative to inspect and access the patient's medical records when the patient has a matter before the Mental Health Review Tribunal and the need to facilitate a legal representative's access to such records.

KEY INFORMATION

Under the Mental Health Act 2007, where the Mental Health Review Tribunal (Tribunal) holds a hearing or review in respect of a mental health patient, the patient has a right to be represented by a legal representative. In certain hearings, such as a mental health inquiry, the patient must be represented by a legal representative (or other person approved by the Tribunal). In most cases, a patient's legal representative will be a legal practitioner from LegalAid or a LegalAid panel firm.

In order to ensure that a patient's legal representative can appropriately represent the patient, the Mental Health Act gives a patient's legal representative the right to inspect or have access to any medical records in the possession of the mental health facility at the Local Health District/Specialty Network relating to a patient who has a hearing before the Tribunal.

A legal representative's right to access a patient's records is important in order to ensure that that the legal representative can understand the basis on which the patient has been detained and can properly and fully make submissions to the Tribunal in relation to the patient's detention.

A Local Health District/Specialty Network must facilitate a patient's legal representative's right to inspect or access information about a patient's detention, including admission documents, progress notes and relevant reports.

In advance of a hearing before the Tribunal, the relevant unit in a Local Health District/Specialty Network (such as a mental health facility or medical record unit) must provide the patient's legal representative with access to the medical records of patients who have a hearing before the Tribunal and who are represented by the legal representative. This should generally be done as follows:

- A list of all patients who will be seen by the Tribunal should be prepared by the relevant unit in the Local Health District/Specialty Network in advance of the Tribunal hearing.
- Two copies of the each patient's "relevant medical records" should be printed in advance of the Tribunal hearing - one copy for the Tribunal and one for the patients' legal representative.
- Where a legal practitioner from LegalAid, or a LegalAid panel firm, attends to represent patients, they should be asked to confirm they have been appointed by LegalAid to act as the patients' legal representative. Once they have confirmed they are acting for the patient/s that will be seen by the Tribunal and the practitioner's identification documents have been sighted, a copy of the relevant records should be provided to the legal representative. A form of Confirmation as Legal Representative is at Appendix 1.
- The relevant unit in a Local Health District/Specialty Network (such as a mental health facility or medical record unit) must keep a copy of the Confirmation as Legal Representative form. This could be kept in a separate file or register in the relevant unit and where reasonable a note should be included in each patient's file noting that the patient's legal representative has been given access to the records.

- In a small number of cases, a legal representative other than from LegalAid, or a LegalAid panel firm, will represent a patient. In such cases, written confirmation they act for the patient, and identification documents sighted, must be provided for inclusion in the patient's medical record before a copy of the relevant records is provided to the legal representative. A copy of the written confirmation should be placed in the patient's medical record.
- If a medical practitioner considers that there is information in the medical records that will be harmful for the patient's legal representative to share with the patient, the medical practitioner should warn the legal representative that it would be harmful to share the information with the patient. A legal representative is obliged to have due regard to the warning and not obliged to disclose the information to the patient. If the medical practitioner remains concerned, the practitioner can seek an order prohibiting the disclosure of information to the patient from the Tribunal.

This procedure can be adapted locally when giving access to electronic records.

Relevant medical records will include, at a minimum:

- For a mental health inquiry, all admission and detention documents relating to the current detention of the patient. This will include Assessment Form/s completed at the time of admission. If a person is transferred from another facility there may be more than one such form.
- For a mental health inquiry, a copy of the Statement of Rights, signed and dated by the patient where possible or, if refused, annotated copies recording the same and notations documenting later service.
- Nomination of Designated Carer form/s (including any exclusions) and, if nomination is refused, documentation of any determination by an authorised medical officer or Director of Community Treatment in relation to their appointment of a Principal Care Provider; evidence of further attempts to have the person nominate a Designated Carer.
- Documentation of any recent reviews carried out by a Consultant and/or Registrar or other member of the treating team.
- Documentation by the Consultant/Registrar of their final review prior to the Tribunal hearing, including any plan that specifies the order to be sought at the hearing.
- Recent progress notes.
- Any recent medical practitioner's report.
- Any recent social work or allied health report.
- Any other documents specifically requested by the Tribunal in relation to the matter.

If the patient's medical record contains details about a risk of significant harm under the Children and Young Persons (Care and Protection) Act, details about the mandatory reporter or the report must not be disclosed to the patient's legal representative.

In some circumstances, a patient's legal representative may request access to additional information about the patient. Where the request relates to the patient's mental health or detention, the information should be provided to the patient's legal representative.

Once the legal practitioner is given a copy of the records, the copy of the records is the responsibility of the legal practitioner and can be removed from the hospital. A patient's legal representative will have their own professional and privacy obligations to maintain the confidentiality of the patient's medical records.

Appendix 1: Confirmation as Legal Representative – LegalAid (including LegalAid Panel Firms) - for matters before the Mental Health Review Tribunal

Confirmation as Legal Representative

I,_____, of_____, confirm that I have been appointed by LegalAid to legally represent the patients below who have a hearing before the Mental Health Review Tribunal and who are detained at _____.
[Name of patients and their MRN to be included by the mental health facility]

Name of Patient	MRN

[Legal representative to delete any patient's name who they are not representing]

If a patient does not confirm the instructions, I undertake to inform the mental health facility and return all records provided to me by the facility.

_____

Signed this day of 20

Note: under the Mental Health Act 2007, if a medical practitioner warns the legal representative of that it may be harmful to communicate to the patient, or any other person, specified information contained in the medical records, the legal representative is to have full and proper regard to that warning and the legal representative is not obliged to disclose to the patient any information in the records.

THE GUARDIANSHIP APPLICATION PROCESS FOR ADULT INPATIENTS OF NSW HEALTH FACILITIES (GL2017_013)

GL2017_013 rescinds GL2016_026

PURPOSE

This Guideline will assist relevant professionals, including medical, allied health, nursing and midwifery staff in NSW Health facilities to understand their roles and responsibilities when making an application to the Guardianship Division of NCAT.

KEY PRINCIPLES

The Guideline aims to standardise practice across NSW Health facilities to improve the process for adult inpatients waiting for a guardianship hearing by ensuring that NSW

Health facilities are aware of:
1. When an application to the Guardianship Division of NCAT is necessary and appropriate.
2. Who is responsible for coordinating the application.
3. Who to consult for advice when considering making a guardianship/financial management application.
4. Making applications and providing reports to the Guardianship Division of NCAT within seven days.
5. What assessments and evidence is required when submitting an application to the Guardianship Division of NCAT.
6. How to record data for patients waiting for guardianship on the patient flow portal.

USE OF THE GUIDELINE

This document provides guidance to NSW Health inpatient facilities and their relevant staff when considering whether an application to the Guardianship division of NCAT is necessary. This document should be used as a practice guideline rather than a mandatory directive.

A full copy of the guideline is available at:
https://www1.health.nsw.gov.au/pds/Pages/doc.aspx?dn=GL2017_013

318(26/06/17)

GUARDIANSHIP APPLICATION PROCESS FOR ADULT INPATIENTS OF NSW HEALTH FACILITIES (IB2017_001)

PURPOSE

The purpose of this Information Bulletin is to inform NSW Health staff:
1. How to obtain assistance in making submissions to NCAT arguing that Local Health Districts (LHDs) and Specialty Networks have legal standing to lodge applications for guardianship orders on behalf of inpatients, and
2. Of changes to NCAT's practice and procedures.

KEY INFORMATION

GL2016_026: The Guardianship Application Process for Adult inpatients of NSW Health Facilities, has been developed in collaboration with clinicians from across Local Health Districts and Pillar organisations.

1. Applications should now be made in the name of the LHD or Specialty Network and legal assistance is available to support this change
The Guideline recommends that applications to NCAT for guardianship orders be made in the name of the LHD or Specialty Network, rather than in the name of an individual health professional. This represents a change to the previous practice of health professionals, typically social workers, lodging

applicants in their own name. The primary purpose of this change is to protect individual health professionals from any adverse consequences of being named as a party to Tribunal proceedings.

Where applications are made in the name of the LHD, NCAT may hold a directions hearing, and request submissions on whether the organisation has standing to be an applicant.

Should this occur in respect of an application, please contact Legal and Regulatory Services at the NSW Ministry of Health (legalmail@doh.health.nsw.gov.au / telephone 9391 9606) so that assistance with preparing and lodging submissions can be provided.

2. Changes to practices and procedures in the Guardianship Division of NCAT

NCAT has advised that from 1 January 2017:
- The guardianship and financial management application forms will be separated into two forms
- The applicant will be directed to give (serve) a copy of the application and any attachments to the parties and the subject person
- The parties will be directed to give (serve) each other any material instead of the registry distributing it
- All parties will receive a notice of hearing, and
- Prior to the hearing the registry will send a list of the materials provided to the Tribunal to the parties and send the material to the subject person.

Service of a copy of the application and any attachments to the parties and the subject person may be done by providing it to the party, or by posting it to them. Service should be documented by the LHD (for example by making a file note stating that the document was handed to the party or keeping a copy of the covering letter, if service is by post).

318(09/01/17)

ADMISSION POLICY FOR NSW HEALTH (PD2017_015)

PURPOSE

The purpose of this policy is to provide guidance to health service staff in regard to the decision to admit, the admission of patients to hospital and associated business processes. This policy aims to ensure consistency in the way that admissions occur and applies to all NSW public hospitals and publically contracted care in other facilities in NSW.

MANDATORY REQUIREMENTS

This Policy Directive applies to all NSW public hospitals (and publically contracted care facilities), which are required to have local policies, protocols and procedures in place consistent with the attached Admission Policy for NSW Health procedures document.

This policy does not describe the data or reporting requirements for the Admitted (and Non-Admitted) Patient Data Collections, which are outlined in separate policies.

IMPLEMENTATION

Chief Executives are responsible for ensuring that this Policy Directive is brought to the attention of Clinical, Finance and Administrative staff who are involved in the admissions process.
Health System Information and Performance Reporting (HSIPR) branch will provide information to existing data governance groups and key established reference groups to assist with local implementation. HSIPR will arrange individual Local Health District/Speciality Health Network information sessions in 2017 to facilitate the introduction of the Admission Policy.

318(15/06/17)

ADMISSION POLICY FOR NSW HEALTH - Procedures

1 INTRODUCTION

The purpose of this document is to provide guidance to health service staff in regard to the decision to admit, the admission of patients to hospital and associated business processes. This policy provides principles and criteria to assist in the decision making process.

The condition, acuity and clinical needs of the patient, as well as the availability of appropriate clinical resources are to be the principal factors guiding treatment decisions and in determining the most appropriate setting for their care.

The decision to admit should not influence specific care and treatment decisions for individual patients. While the decision to admit is based on providing the most appropriate setting in which to treat the patient, it chiefly determines subsequent administrative processes including billing and data collection and reporting. The specification and requirements for those processes are provided separately rather than in this policy, e.g. resources for the Admitted Patient and other data collections are provided at the Data Collections page of the NSW Health Intranet.

1.1 Scope

This policy applies to all NSW public hospitals as well as publically contracted care in other facilities within NSW.
Decisions to admit and discharge patients are clinical decisions and should only be influenced by non-clinical factors as specifically outlined in the Criteria for Admission below.
Patients within residential aged care or community residential settings are out of the scope of this policy.

1.2 Admission Policy Principles

This policy is built on the following nine principles which must be read in conjunction with the *Criteria for Admission* (see 2.2):

1. The decision to admit a patient is primarily a clinical decision to be made by a clinician with admitting rights to the facility who must determine that the patient requires admission.
2. The decision to admit a patient is to be based on the patient's condition and clinical needs, the facility's ability to meet those needs, including the availability of appropriate clinical resources, and with reference to the *Criteria for Admission* listed below (2.2)
3. The decision to admit should be made when other care and treatment options have been considered and determined not to be optimal for that patient at that time.
4. The decision to admit a patient should not be influenced by the following factors;
    - the facility's key performance indicators;
    - the treatment location; or
    - the patient's financial status.
5. Once a patient has been discharged from admitted patient care, if a clinician with admitting rights determines that the patient again requires admitted patient care, this is to be a new admission; not a continuation of the previous admission.
6. An admission may be planned or unplanned. In the case of a planned admission, the decision to admit may be made prior to the patient's presentation at the facility.
7. The clinician with admitting rights to the facility is responsible for ensuring that the clinical decision to admit and the reason for admission are documented in the patient's health record.
8. Application of the Admission Policy should not restrict local innovation in clinical practice or development of alternative models of care.
9. Local governance will provide the strategic and operational direction through which this Admission Policy is implemented.

2 DEFINITION AND CRITERIA FOR ADMISSION

2.1 Admitted Patient

An admitted patient is a person: (i) for whom a clinician with admitting rights to the facility has determined meets the criteria for admission and requires a level of care provided in an inpatient setting, and (ii) who has undergone the admission process but has not yet been separated by the facility.
For each admission there must be documentation in the patient's health record by the admitting clinician, or another authorised clinician, that supports the need for admission.
An admission can occur in a hospital or, in the case of 'Hospital in the Home' programs, another setting such as the patient's residence.

2.2 Criteria for Admission

2.2.1 Emergency Department Patient

A patient treated solely within the emergency department is not to be an admitted patient.
A patient presenting to an emergency department can only be admitted if a clinician with admitting rights to the facility determines the patient requires admission and the patient is transferred to another appropriate treatment location within that facility.

This is to ensure compliance with national regulatory requirements and is the only non-clinical criterion that should direct the decision to admit or not. This provision should not impact or restrict the care and treatment provided to any emergency department patient.
For further information see 3.1 Patients in Emergency Departments

2.2.2 Intended Medical Care or Clinical Management

- The patient requires observation in order to be assessed or diagnosed, this may constitute:
  - Active, skilled observation for assessment, diagnosis or treatment.
  - Initiation or stabilisation of therapy or palliation.
  - Structured therapeutic contact in a rehabilitation or mental health program.
- The patient requires, at a minimum, daily management of their treatment and/or medication, this may constitute:
  - Observation of vital, physiological, behavioural or neurological signs.
  - Parenteral medications and/or fluid replacement.
  - Structured therapeutic contact with appropriately trained and qualified health professionals in one-to-one counselling sessions or group therapy sessions that have clearly defined clinical outcomes.
- The patient's condition requires clinical management and/or facilities not available at their usual residential environment or other non-admitted setting.

2.2.3 Intended Procedure

The patient requires a procedure/s that cannot be performed in a stand-alone facility, such as a doctor's room without specialised support facilities and/or expertise available. Intended procedures are defined as the following:

- **Type A** procedure as specified in the *Private Health Insurance (Benefit Requirements) Rules 2011.*

  Note: This should be read in conjunction with the *Private Health Insurance Act 2007 (Cth)* and the *National Health Act 1953 (Cth)*; or

- **Type B** procedure is a procedure specified as a Band 1, 2, 3, or 4 as described in the Private Health Insurance (Benefit Requirements) Rules 2011; or
- **Type C** procedure is a procedure specified in reference to Medical Benefits Schedule (MBS) items as detailed in the Private Health Insurance (Benefit Requirements) Rules 2011 general medical services tables. These procedures normally do not require hospital treatment.

Special circumstances that may warrant an admission for a Type C Professional Attention Procedure are:

- The patient's residence is in a remote location
- There is insufficient support available in the patient's usual residence
- The patient requires general anaesthesia so that a Type C procedure can be performed (e.g. child requiring a CT scan).

Note: A patient may remain an admitted patient even if the procedure for which they are admitted is cancelled.

2.2.4 Newborns

A patient aged 9 days or less must be admitted under the following additional scenarios:

- When born in the hospital;
- When a patient was intended to be born in the hospital and the birth occurs within 24 hours of the mother's arrival at the hospital; and
- When a newborn baby born at home or another facility presents to hospital and requires specialist care.

A still born baby (of 20 weeks gestation or more, or if the gestation cannot be determined, with a body mass of 400 grams or more) is not admitted but must be registered in the patient administration system.

2.2.5 Other

Where there is a legal requirement for admission (e.g. under child protection legislation) or involuntary admission of patients under certain legislation, such as the *Mental Health Act 2007 (NSW)*, the *Drug and Alcohol Treatment Act 2007 (NSW)*, and the *Mental Health (Forensic Provisions) Act 1990 (NSW).*

Community Residential services are out of scope for this admission policy as the patients receiving this care are not admitted.

3 ADMISSION GUIDELINES

3.1 Patients in Emergency Departments

A patient treated in and discharged from an emergency department only is not an admitted patient and must not be recorded as such. These patients must be recorded and counted as emergency department non-admitted attendees.
A patient who presents to an emergency department and whose clinical condition meets the criteria for admission, may be formally admitted to the hospital but must be transferred to another appropriate treatment location within the same facility. Such locations may include inpatient wards, operating theatres, short stay units and other treatment locations appropriate to the care required.
When the decision is made to admit a patient from the emergency department, but the patient is discharged, transferred or dies before they proceed to an admitted patient location in that facility, the admission is to be retracted.

The admission date and time are the date and time that the clinical decision to admit the patient is made. The length of time a patient spends in ED is not a criterion for admission; admission is determined by clinical need.

Patients being transferred to another hospital or facility do not require admission before being transferred. Admissions to short stay units must comply with the '*Emergency Department Short Stay Units*' Policy Directive (PD2014_040; 13 Nov., 2014).

3.2 Boarders

A boarder is a person receiving food and/or overnight accommodation from the hospital but does not require clinical treatment or care. For example, a mother accompanies an admitted child or a child staying with an admitted mother.

Patients who turn 10 days of age and do not require clinical care are to be separated and, if they remain in the hospital, are designated as a boarder.

A boarder is not an admitted patient. The hospital may register a boarder in its patient administration system.
A boarder in the Justice Health and Forensic Mental Health Network is defined as a patient who has been medically discharged and is no longer receiving medical treatment. They are however receiving food and/ or accommodation whilst awaiting placement elsewhere.

3.3 Organ Donation

Posthumous organ procurement is the harvesting of human tissue for the purpose of transplantation from a donor who has been declared dead.
Posthumous organ procurement episodes are not reported as admitted patient episodes but must be recorded by the hospital on their patient administration system.
A live organ donor may be admitted to hospital if they meet the criteria for admission.

3.4 Collaborative Care

Collaborative Care is care provided to a patient under an agreement between a purchaser or requestor of admitted patient services and a provider of admitted patient services. Collaborative Care includes:

- contracted care, between a private sector admitted patient facility and a public sector admitted patient facility or two public facilities where a financial or other agreement is in place; AND

- arrangements between two public hospitals where both sites provide part of the continuous care, and where at least one provides only a same-day service, regardless of financial arrangements.

Where a patient is admitted to the purchasing hospital for intended overnight admission and is transferred to and returns from the provider hospital on the same day, the patient must be placed on leave from the first (purchasing) hospital while they are under the care of the second (provider) hospital.
If the patient remains overnight at the second (provider) hospital, they must be discharged from first (purchasing) hospital and admitted to second hospital.

Further information is available in the Admitted Patient Data Dictionary

3.5 Leave from Hospital

An admitted patient may be granted leave with the approval of their Admitting Medical Officer, or other authorised clinician, for a designated period of up to and including seven consecutive days.

The episode of care is continuous while the patient is on leave.

A patient on approved leave may be discharged while on leave.

A voluntary patient on approved leave who does not return by their nominated leave return date, is to be discharged and their discharge date recorded as the earlier of the nominated leave return date or the date which the patient notified the hospital that they were not returning from leave.

A patient that does not return from leave at the conclusion of seven days must be discharged.

For patients who are absent without leave (AWOL), if they do not return within seven days, record the discharge date and time as the date and time at which the patient was first noted to be absent. Involuntary Mental Health patients may be granted a longer period of leave (see section 3.5.2).

Where a patient is on a treatment program that requires admitted patient care each day, but not overnight care, they are to be admitted and discharged each day rather than remaining as a single admission with periods of overnight leave.

Same day patients are not generally granted leave.

3.5.1 Patients on Leave Presenting to an Emergency Department

A patient on leave that presents to the emergency department of the hospital to which they are currently admitted is not to be discharged and then readmitted. The patient should have an ED Type of Visit of 'Current Admitted Patient Presentation' and, if required, a care type change.

A patient on leave from one hospital who presents to the emergency department of another hospital and is admitted to that hospital must be discharged from the first hospital. The second hospital must inform the first that they have admitted the patient.

3.5.2 Involuntary Mental Health Patients

An authorised medical officer may only grant an involuntary patient leave in accordance with the provisions of the *Mental Health Act 2007*.

The period of leave for an involuntary mental health patient may exceed seven days.

An involuntary patient should only be discharged whilst on leave if an authorised medical officer from the admitting facility authorises it, having satisfied themselves that the patient either no longer requires involuntary care under the *Mental Health Act 2007*, or their involuntary care has been transferred to another treating facility or clinician. Under such circumstances, the date of discharge is the date the medical officer authorises the discharge or transfer of the patient. This also applies to involuntary mental health patients who are absent without leave (AWOL).

An involuntary mental health patient on leave from one hospital who presents to another hospital should not be discharged from the first hospital unless an authorised medical officer from that hospital authorises the discharge or transfer of the patient to the second hospital. In the absence of such a discharge or transfer, the patient must remain admitted to both facilities simultaneously.

For further information see Patient Leave Procedures Manual and *Mental Health Act 2007*.

3.6 Care Delivered in an Outpatient Setting

An admission occurs when a clinician with admitting rights to the facility determines that a patient meets the clinical criteria for admission and requires admitted patient care. This does not preclude admitted patients being treated in an outpatient setting.

For procedures and interventions that may be delivered as either admitted or non-admitted care, the decision to admit must be based on the condition, acuity and specific clinical and support needs of that patient.

3.7 Inter-Facility Transfers

A patient that is to be transferred to another facility does not need to be admitted before transfer. Admission to the initial facility may occur if a clinician with admitting rights at that facility determines that the patient meets the clinical criteria for admission and requires admission to the facility prior to transfer.

All inter-facility transfers must comply with '*Inter-facility Transfer Process for Adults Requiring Specialist Care Policy Directive*' (PD2011_031).or *Children and Adolescents – Inter Facility Transfers (PD2010_031).*

3.8 Hospital in the Home

Hospital in the Home (HITH) is a supported model of care and admissions under the HITH program must comply with the provisions of this policy. For specific details around the definitions and eligibility for HITH, refer to the HITH Guidelines and the Admitted Patient Data Collection Data Dictionary.

3.9 Admissions When No Clinician With Admitting Rights is Present

In most circumstances a clinician with admitting rights will be physically present to admit a patient, however there are certain circumstances where this is not the case, such as in small, rural or remote facilities.

In the circumstances where a clinician with admitting rights is not physically present but can be contacted, a decision to admit may be made and conveyed to on-site staff who must clearly document this in the patient's health record.

Where a clinician with admitting rights cannot be contacted to make the decision to admit, an admission cannot proceed. The care provided will be either an ED attendance or a non-admitted service.

4 DISCHARGE

A patient is discharged if:

- the treating clinician has decided that they no longer require admitted patient care, the patient has been advised they can leave and has left the treatment location; or
- the patient signs a "discharge against medical advice form" and leaves the treatment location; or
- the patient is declared deceased.

For patients who are being transferred to another facility for ongoing clinical care, discharge occurs when either (i) the patient is under the care of the transporting authority, if the transporting authority is a separate entity to the treating facility (e.g. NSW Ambulance Service), or (ii) the patient is admitted to the receiving facility, if the original treating facility is providing the transportation.
For Hospital in the Home patients, discharge occurs when the treating clinician has decided that they no longer require admitted patient care and the patient has been advised that they are to be discharged.

5 FURTHER INFORMATION

5.1 Residential Care Clients

For the purposes of this admission policy, residential aged care clients and community residential clients are out of scope.

A residential aged care client is a person who receives care in a wholly or partially Commonwealth funded residential aged care bed.

A community residential client is a person who receives care in a designated mental health or drug and alcohol community residential bed.
While these patients must be registered on a local patient administration system, for reporting purposes these patients are not considered to be admitted patients. Rules surrounding residential aged care and community residential client reporting can be found in the Admitted Patient Data Dictionary.

5.2 Admission Documentation

The documentation in the patient's health record must be sufficient to support their need for admission. For all patients admitted from the elective surgery waiting list, 'Recommendation For Admission' documentation must be completed. See the '*Waiting Time and Elective Surgery Policy*' (PD2012_011) section 2.4.

5.3 Client Registration

The requirement to register patients is separate and additional to admission and the documentation required for an admission. Requirements for patient / client registration are detailed in the following:

- '*Client Registration Policy*' (PD2007_094; 19 December, 2007)
- '*Client Registration Guideline*' (GL2007_024; 19 December, 2007)
- '*Aboriginal and Torres Strait Islander Origin - Recording of Information of Patients and Clients*' (PD2012_042; 25 July, 2012).
- '*Health Care Records – Documentation and Management*' (PD2012_069; 21 December, 2012)

6 GLOSSARY

Absent Without Leave (AWOL)
A patient who is absent without leave is a current patient of that facility who has left care without permission to do so.

Admitted Patient
An admitted patient is a person: (i) for whom a clinician with admitting rights to the facility has determined meets the criteria for admission and requires a level of care provided in an inpatient setting, and (ii) who has undergone the admission process but has not yet been separated by the facility.

Episode of Care
Each admission is comprised of one or more episodes of care which represent a period of care with a common clinical focus as reflected by the "care type".

For example, a patient who is receiving acute intervention for a stroke will have a care type change to rehabilitation if and when the main focus of care changes from acute management to functional improvement.

For further details see the '*Care Type Policy for Acute, Sub-Acute and Non-Acute Patient Care*' (PD2014_010).

Hospital in the Home (HITH)
Hospital in the Home (HITH) services provide daily care to children and adults with acute conditions who reside outside hospital, as a substitution of in-hospital care.
A person may receive their care at home (including Residential Aged Care Facilities), in a hospital clinic, community setting, at school or in the workplace. The place of residence may be permanent or temporary.

Inpatient Ward
An inpatient ward is a physical location where admitted patients are accommodated or treated for their care and treatment

Non-Admitted Patient
A person who receives care or treatment but has not undergone the hospital's admission process. This includes patients treated entirely within the Emergency Department.

Overnight Admission
An overnight admission is where the admission date and separation date occur on different calendar days.

Same Day Admission
A same day admission is where the admission date and separation date occur on the same calendar day, irrespective of the intended length of stay.

PRIVACY INTERNAL REVIEW GUIDELINES (GL2019_015)

GL2019_015 rescinds GL2006_007

PRPOSE

NSW privacy law establishes a process of internal review for handling a privacy complaint, in certain circumstances. These Guidelines help staff navigate and comply with all legislative requirements in conducting a privacy internal review. Guidance is provided on undertaking an appropriate investigation into the privacy complaint, including conducting interviews and consultation requirements. The Appendices include template letters and reports to provide practical assistance to staff, and a consistent approach to privacy complaint handling for NSW Health agencies.

KEY PRINCIPLES

60-day time limit

A privacy internal review must be completed as soon as practicable, and a time limit of 60 calendar days applies. The 60-day time limit starts from the receipt of the first written privacy complaint or request for privacy internal review. In exceptional circumstances, the agency may ask the applicant for an extension of time. (*Sections 5.3 and 5.4*)

NSW Privacy Commissioner

The NSW Privacy Commissioner must be notified of all applications for privacy internal review, provided with a draft investigation report for comment, and provided with the final report and covering letter to the applicant. (*Sections 5.7 and 7.3*)

NSW Civil and Administrative Tribunal

An individual who is dissatisfied with the outcome of the agency's privacy internal review, can lodge an application for administrative review with the NSW Civil and Administrative Tribunal (NCAT). This must be lodged within 28 calendar days of receipt of the privacy internal review report from the NSW Health agency. (*Section 7.1*)

USE OF THE GUIDELINE

Chief Executive

The Chief Executive, or their Senior Executive delegate, is ultimately responsible for the privacy internal review process and outcome. The Chief Executive, or their Senior Executive delegate, should approve the final internal review report and letter to the applicant. (*Section 3.4*)

Privacy Contact Officer, NSW Health agency

Privacy internal review is normally undertaken by the Privacy Contact Officer for the NSW Health agency. Privacy internal review must be undertaken without bias, and by an officer who is neutral to the circumstances relating to the complaint. If an officer was substantially involved in the matter relating to the complaint, including attempts to informally resolve the complaint, they are unable to undertake the privacy internal review. In such case, an alternative review officer must be appointed. (*Section 3.4 & 5.1)*

Ministry of Health

The Privacy Contact Officer, Ministry of Health and legal officers within the Legal and Regulatory Services Branch, may assist agency staff with matters of privacy internal review.
NSW Health agencies should:

- notify relevant privacy internal review matters to the Ministry, (*Section 5.5*)
- seek advice and clarification from the Ministry as necessary, (*throughout*)
- provide the draft internal review report to the Ministry for comment, (*Section 6.2*)
- provide final letter and internal review report to the Ministry, (*Section 6.4*)
- report statistical data on privacy internal reviews in the agency's privacy annual report (*Section 7.2*)

A full copy of the guideline is available at:
https://www1.health.nsw.gov.au/pds/Pages/doc.aspx?dn=GL2019_015

USE OF EXCHANGE OF INFORMATION PART 13A CRIMES (DOMESTIC AND FAMILY VIOLENCE) ACT 2007 FORM (IB2016_056)

PURPOSE

The purpose of this Information Bulletin is to inform NSW Health service providers and Health Information Management staff of the publication of the Exchange of Information Part 13A *Crimes (Domestic and Personal Violence) Act 2007* Form. This Information Bulletin also provides guidelines for the use of the form.

The Exchange of Information Part 13A *Crimes (Domestic and Personal Violence) Act 2007* Form is a paper form **ONLY** and is **NOT** to be scanned into any electronic medical records systems.

KEY INFORMATION

Reducing domestic violence is a NSW Premier's Priority. Safer Pathway is a whole-of government response designed to provide accessible and effective domestic violence support services to victims, with a focus on victims at serious threat. Under Safer Pathway, police, justice, health, education, child protection and victim service agencies work in an integrated manner to reduce threat to adult and children victims of domestic violence. This is to ensure that a seamless response can meet the individual needs of victims and children, and service providers jointly manage threats of further violence.

NSW Health has a key role as an interagency partner in fortnightly Safety Action Meetings, which are a component of Safer Pathway. Participation in Safety Action Meetings includes file searches for relevant health information, participation in fortnightly meetings and follow up actions resulting from Safety Action Plans. NSW Health is represented by up to three clinicians / healthcare professionals at a Safety Action Meeting, including Mental Health and Drug and Alcohol services wherever possible.

Please note that the information contained in this document is to be read in conjunction with the NSW Government guidelines listed below, and attached to this Information Bulletin. Information and records relating to Safety Action Meetings must be managed and stored in accordance with these documents:
- Safer Pathway Domestic Violence Information Sharing Protocol
- Safety Action Meeting Manual
- Domestic Violence and Child Protection Guidelines

Exchange of Information Part 13A *Crimes (Domestic and Personal Violence) Act* 2007 Form

The NSW Health Exchange of Information Part 13A *Crimes (Domestic and Personal Violence) Act* 2007 Form is a state form that assists NSW Health workers to comply with requirements under the NSW *Crimes (Domestic and Family Violence) Act 2007*.
This legislation governs information sharing related to Safety Action Meetings, and other victims of domestic and family violence at Serious Threat.

The form is available for download as an interactive PDF or to print on demand via Stream Solutions.

A number of key principles underlie information exchange at Safety Action Meetings.
These include:

- The threshold of *serious threat* under which information exchange at Safety Action Meetings takes place, means that there is a reasonable belief that there is serious threat to a victim's life, health or safety, or other person's life, health or safety, due to domestic violence, and action is necessary to prevent or lessen this threat. A threat does not have to be imminent to be serious.

- Information sharing at Safety Action Meetings is limited to that which is necessary to prevent or lessen a serious threat to the life, health or safety of victims, their children or other persons. Each member is responsible for decisions about what information it considers reasonably necessary to share.
- Consent to share information is preferable, but in instances of Serious Threat, not necessary. The Local Coordination Point which is staffed by the Women's Domestic Violence Court Advocacy Support Service, or Victim's Services, are usually responsible for seeking consent from a victim for information sharing at a Safety Action Meeting.
- Consent to share information is NEVER requested from a person listed on a Safety Action Meeting agenda as a perpetrator of violence. Information about Safety Action Meetings and Safety Action Plans must likewise NOT be shared with alleged perpetrators of violence. This could be vital to ensuring the safety of a victim.

The Exchange of Information Part 13A *Crimes (Domestic and Personal Violence) Act* 2007 Form is to be used with the following guidelines:

- Use in preparation for Safety Action Meetings, and other information exchange that takes place under Part 13A of the NSW *Crimes (Domestic and Family Violence) Act 2007*
- A new form is to be used per client and per client file system reviewed:
  - Information from other service areas are **NOT** to be compiled on a single form
  - Information from other clients' files are **NOT** to be compiled on a single form
- Store in the client file reviewed. This must be in paper form **ONLY** and is **NOT** to be scanned into electronic systems.
- Actions from a Safety Action Meeting are to form part of the contemporaneous client notes in the appropriate client file.

The Exchange of Information Part 13A *Crimes (Domestic and Personal Violence) Act* 2007 Form intersects with other healthcare privacy considerations and information exchange processes including:

1. Sexual Assault Communications Privilege

It is vital that staff are aware that information sharing at Safety Action Meetings is limited to that which is necessary. In the case of information which may be subject to the Sexual Assault Communications Privilege, it is recommended that advice from Local Health District legal services, or the Domestic and Family Violence team at the Ministry of Health be sought *prior* to information exchange under 13A.

Sexual assault communications are made in the course of a confidential relationship between a victim of sexual assault and a counsellor. The sexual assault communications privilege provides an absolute prohibition, in NSW courts, against requiring the production of documents recording counselling communications in preliminary criminal proceedings. Once the main criminal proceedings have started, the privilege will also apply unless the court specifically grants leave and requires the documents be provided. Documents that are the subject of this privilege in any criminal proceedings continue to be privileged in subsequent civil proceedings. A sexual assault privilege also applies in ADVO proceedings.

The purpose of this privilege is to give victims a confidential and safe place to talk about, or disclose, information about their traumatic experience, personal or sensitive issues and concerns. It includes counselling communications made by, to or about a victim. In NSW, an objection may be made to produce a protected confidence on the ground that it is privileged; but the victim of the sexual assault can consent to disclosure.

2. Child Protection

In cases of domestic violence where children are victims, or are affected by domestic violence in the home (including when listed on a SAM agenda as a perpetrator of violence), prescribed bodies should exchange information under Chapter 16A in the first instance. Both Part 13A and Chapter 16A prioritises the safety, welfare, and wellbeing of a child or young person over an individual's right to privacy.

Chapter 16A of the *Children and Young Persons (Care and Protection) Act 1998 (CYPCP Act)* overrides other laws that prohibit or restrict the disclosure of personal information such as the *Privacy and Personal Information Protection Act 1998* (*PIPP Act)* and the *Health Records and Information Privacy Act 2002 (HRIP Act)*. The focus of the exchange of information is on the safety, welfare and wellbeing of children, and facilitating the provision of services to these children and their families.

Service providers who are prescribed bodies under the *CYPCP Act* may exchange information that relates to a child or young person's safety, welfare or wellbeing, whether or not the child or young person is known to the Department of Family and Community Services (FACS).

Where Chapter 16A does not apply, information may be shared under Part 13A and the Safer Pathway Domestic Violence Information Sharing Protocol.

NSW Health staff should also be aware that information sharing under 13A *does not replace* mandatory reporting obligations for children and young people at risk of significant harm. Where information exchange processes identify risk of harm to a child or young person, NSW Health staff are required to apply usual clinical practice, including application of the Mandatory Reporter's Guide, and reports to FACs where indicated. This occurs within the normal timeframe for any risk of harm identification and is *not* dependent on Safety Action Meeting dates or processes.

3. Health Information Access

The *Health Records and Information Privacy Act 2002*; the *Government Information (Public Access) Act 2009* and the *Privacy and Personal Information Protection Act 1998* govern access to information held in health records. As a general rule, a victim's personal and health information must never be disclosed to an alleged perpetrator or any other person acting on behalf of the alleged perpetrator, such as the alleged perpetrator's legal representative. Part 13A and the Protocol seek to ensure that the victim's safety is not compromised by individuals' right to access their information under NSW privacy laws. For this reason, Part 13A and the Protocol override the *PPIP Act* and the *HRIP Act* in when the applicant is the alleged perpetrator.

In domestic violence situations it can be important for the victim's safety that the alleged perpetrator remains unaware of impending interventions. If the alleged perpetrator is aware, this may result in an escalation of violence. Service providers must also consider the potential for placing the victim at increased risk of violence where the attempt to reduce or prevent the serious threat was not successful and the alleged perpetrator becomes aware that the victim has reached out for support.

Requests for any file containing the Exchange of Information Part 13A *Crimes (Domestic and Personal Violence) Act* 2007 Form and other related file notes, where the applicant is the alleged perpetrator, **could reasonably be expected to expose a person to a risk of harm**. For information relating to this see the NSW Health *Privacy Manual for Health Information*, section 12. Where any doubt exists about the release of information relating to Safety Action Meetings, consult Local Health District legal advice.

4. Subpoenas

A service provider that has used or disclosed information may be subpoenaed to produce the information held, including the Exchange of Information Part 13A *Crimes (Domestic and Personal Violence) Act* 2007 Form. If a Local Health District or Specialty Health Network receives a subpoena to produce information about a victim or an alleged perpetrator, that service provider must seek legal advice before producing any information. A subpoena may be challenged on a number of different grounds, including abuse of process, oppression and/or on the basis of a privilege at law over the information.

All subpoenaed files containing the Exchange of Information Part 13A *Crimes (Domestic and Personal Violence) Act* 2007 Form, where privilege at law does not exist, should be subject to a Sensitive Information Claim. See NSW Health Subpoenas Policy (PD2010_065) for how to make these claims.

ELECTRONIC MEDICAL RECORDS OF INFORMATION EXCHANGE TO REDUCE DOMESTIC AND FAMILY VIOLENCE THREAT

(IB2020_022)

PURPOSE

This Information Bulletin clarifies the requirements around notations made within electronic medical records of information exchange under Part 13A Crimes (Domestic and Personal Violence) Act 2007.

It contains information for health services which supplements the NSW Health Information Bulletin *Use of Exchange of Information Part 13A Crimes (Domestic and Personal Violence) Act 2007 Form* (IB2016_056).

KEY INFORMATION

The *NSW Health Exchange of Information Part 13A Crimes (Domestic and Personal Violence) Act 2007 Form* is a state form that assists NSW Health workers to comply with requirements under the *NSW Crimes (Domestic and Personal Violence) Act 2007*.

This legislation governs information sharing related to Safety Action Meetings, and other victims of domestic and family violence at Serious Threat.

Health workers are to continue to follow the NSW Health Information Bulletin *Use of Exchange of Information Part 13A Crimes (Domestic and Personal Violence) Act 2007 Form* (IB2016_056), including the guidance around use of the State Form.

Health services may include minimal information in the progress notes of the electronic medical record indicating that information exchange has occurred to reduce a serious domestic violence threat to a person. Standard statements are included below for use in the progress notes. The statements include a prompt on how to respond where clinicians have ongoing concerns regarding a domestic violence threat.

Information *shared* under Part 13A about a client who is the alleged perpetrator

Staff may include a brief statement in the progress notes of the electronic medical record when information is shared under Part 13A about a client who is the alleged perpetrator and a Safety Action Meeting is held that identifies actions for Health pertaining to the perpetrator.

- Any such statement should be labelled *'VAN Progress Note: Strictly Confidential* ***- not*** *to be shared with client'* and indicate that:

  "This client's file has been reviewed and relevant information shared for the express purpose of reducing a serious domestic violence threat to another person/s including children.

  The client must not be informed that this has occurred.

  Any inappropriate disclosure of the information to [insert client's name] has potential harmful consequences for the safety of a victim/s.

  To discuss concerns about an ongoing or escalating domestic violence threat, contact [LHD service/contact]. Where a clinician has reasonable grounds to suspect that there is a serious and imminent risk to the victim/s or others' safety, Police should be contacted."

Information shared under Part 13A about a client who is a victim

Staff may include a brief statement in the progress notes of the electronic medical record when information is shared under Part 13A about a client who is a victim, and a Safety Action Meeting is held which identifies actions for Health.

- Any such statement should be labelled '*VAN Progress Note: Strictly Confidential – not to be shared before contacting the nominated clinician/service below*' and indicate that:

  "*This client's file has been reviewed and relevant information about the client shared for the express purpose of reducing a serious domestic violence threat to the client or another person, including a child.*

  Any inappropriate disclosure of the information has potential harmful consequences for the victims' safety.

  To discuss the above information and/or concerns about an ongoing or escalating domestic violence threat, contact [LHD service/contact]. Where a clinician has reasonable grounds to suspect that there is a serious and imminent risk to the victim/s or others' safety, Police should be contacted."

The suggested statements for progress notes above can also be applied where information is shared at Safety Action Meetings using Chapter 16A of the *Children and Young Persons (Care and Protection) Act 1998*.

For further relevant information on information sharing and documentation please refer to the *NSW Government Domestic Violence Information Sharing Protocol* and, where sharing information under Chapter 16A, the *NSW Health Policy Directive* Child Wellbeing and Child Protection Policies and Procedures for NSW Health *(PD2013_007).*

The complete Information Bulletin is available at:
https://www1.health.nsw.gov.au/pds/Pages/doc.aspx?dn=IB2020_022

LOOKBACK (PD2023_003)

POLICY STATEMENT

NSW Health Services are to implement lookback processes consistent with the requirements of this Policy Directive to ensure the timely notification and coordinated tracking of affected or potentially affected groups of patients.

SUMMARY OF POLICY REQUIREMENTS

Health Services are to initiate a lookback process when a clinical incident or concern has affected or may affect a group of patients.

Health Services are to undertake the four-step lookback process to identify, track, communicate and provide ongoing advice to these patients. The scope and scale of a lookback process can vary, so Health Services are to use an initial risk assessment to determine whether each element within a step is required.

The lookback process is to align to incident management, open disclosure, critical response and privacy processes.

Health Services are to notify appropriate internal and external bodies and regulators.

In keeping with a risk management approach, Health Services are to escalate as required to the NSW Ministry of Health and/ or the Clinical Excellence Commission.

The lookback process may involve a system wide communication strategy and/ or notifying the wider community. In such circumstances, the Clinical Excellence Commission and/ or NSW Ministry of Health will provide guidance.

The complete Policy is available at:
https://www1.health.nsw.gov.au/pds/Pages/doc.aspx?dn=PD2023_003

To view any policy document as published on the Policy Distribution System click the link on the policy number in the table below.

CHAPTER 10 - IMAGING

TABLE OF CONTENTS

	PD/IB/GL NUMBER
Work Health and Safety – Limiting Staff Exposure to Ionising Radiation	PD2019_044

WORK HEALTH AND SAFETY – LIMITING STAFF EXPOSURE TO IONISING RADIATION (PD2019_044)

PD2019_044 rescinds PD2014_026

PURPOSE

The purpose of this Policy Directive is to assist managers, in conjunction with Policy Directive *Work Health and Safety: Better Practice Procedures*, to meet their duty to ensure that occupationally exposed staff are identified, and prevented from being exposed to ionising radiation that exceeds the dose limits set out in Schedule 5 of the *Radiation Control Regulation 2013 (*the Regulation*)*.

The Regulation defines an *occupationally exposed person* as one who is exposed to ionising or non-ionising radiation directly arising out of, or in the course of, the person's employment.

MANDATORY REQUIREMENTS

NSW Health organisations must ensure that:

- Work procedures, which potentially expose staff to ionising radiation, are identified and assessed using a risk management approach as required under the *Work Health and Safety Act 2011* (WHS Act).
- Safe work practices and procedures are documented and implemented so that staff are not exposed to ionising radiation that exceeds the dose limits as set out in Schedule 5 of the Regulation.
- A Radiation Management Plan is developed in accordance with the Australian Radiation Protection and Nuclear Safety Agency (ARPANSA) *Radiation Protection in the Medical Applications of Ionizing Radiation* Code of Practice (RPS14).
- Staff who are occupationally exposed to ionising radiation are provided with information and training, as necessary, and are made aware of:
    - The hazards that can arise in connection with the use of regulated material, which is defined under the *Radiation Control Act 1990* as meaning radioactive substances, ionising radiation apparatus, non-ionising radiation apparatus of a kind prescribed by the regulations and sealed source devices
    - The safety arrangements that exist to protect persons from such hazards and the steps the person must take in order to minimise the likelihood that such a hazard will arise
    - The name of the person undertaking the radiation safety officer role or other persons from whom they should obtain advice in connection with any matters relating to the use of radioactive substances and radiation apparatus.
- The requirements as set out in the NSW Environment Protection Authority (EPA) *Radiation Management Licence* are complied with, including the Guidelines and Codes to which the licence refers.
- Part 4 Division 2 of the Radiation Control Regulation is complied with in relation to occupationally exposed staff, including the provision of an approved personal radiation monitoring device.
- All monitoring devices are checked, maintained and calibrated in accordance with the document entitled Radiation Guideline 1: Monitoring devices (clause 32 of the Regulation*)*.
- Radiation accidents are reported, investigated and records of accidents maintained, as required under clause 37 of the Regulation.

- Faults or defects when identified are investigated and rectified and any person(s) who may have been exposed to radiation in quantities in excess of those that would normally be received are informed, as required by Clause 40 of the Regulation.

Ultrasound

- Prior to ultrasound examination, sonographers are advised by the referring clinician if a radiopharmaceutical dose has been administered to the patient (prior administration of a radiopharmaceutical is not in itself a contraindication to performing an ultrasound examination).
- Staff exposure is minimised by scheduling procedures requiring close patient contact. In general, where practicable, routine ultrasound examinations should not be performed soon after a patient has been injected with a radiopharmaceutical except in those circumstances where the wellbeing of the patient necessitates otherwise. (The clinical requirement for an ultrasound in this instance needs to be discussed with the referring medical specialist.)

Modified Barium Swallows (MBS)

- Speech pathologists and other staff participating in MBS and associated procedures using fluoroscopy must use personal protective equipment (PPE) as set out in the *NSW Environment Protection Authority* (EPA) *Policy on X-ray Protective Clothing (2014)* and good radiation practice, as set out in the EPA document *Radiation Guideline 6 Part 2: Registration Requirements & Industry Best Practice for ionising radiation apparatus used in diagnostic imaging.*
- For fluoroscopy procedures including MBS studies where speech pathologists, radiologists or other staff such as nurses are present inside the screening room and not behind a protective shield, a properly fitted lead apron and thyroid collar must be worn. This work practice is considered adequate for pregnant staff, provided the lead apron is properly fitted to cover the abdomen, and the radiation monitor (where applicable) is worn under the apron.
- Staff undertaking studies requiring fluoroscopic examination of the patient should receive proper training in all aspects of these studies. This should include training in radiation safety and the proper use of PPE to ensure that doses to themselves and the patient are minimised.
- X-ray equipment used for fluoroscopy procedures including MBS shall be maintained in a condition that meets the requirements for registration in NSW, and only operated by persons licensed to carry out the proposed procedure.

IMPLEMENTATION

Roles and responsibilities:

Chief Executives, Local Health Districts are required to ensure***:***

- The mandatory standards contained in this Policy Directive are communicated to all managers and occupationally exposed staff, and implemented.

Managers and supervisors are required to ensure:

- They identify staff who are occupationally exposed to ionising radiation and assess and minimise or eliminate exposure to ionising radiation
- Radiation monitoring devices and the appropriate personal protective equipment is made available to and utilised by relevant staff
- Staff involved in work procedures that involve possible exposure to ionising radiation receive training in radiation safety and the proper use of PPE to ensure that doses to themselves and the patient are minimised.

Staff are required to ensure:

- They comply with the safe work practices established in their workplace
- They wear the personal radiation monitor issued and any personal protective equipment required while involved in the use of ionising radiation
- They report to the person undertaking the radiation safety officer role any matter which they are aware of which may compromise radiation protection.

PRINCIPLES FOR THE MANAGEMENT OF TUBERCULOSIS IN NSW
(PD2022_007)

PD2022_007 rescinds PD2014_050

POLICY STATEMENT

All services related to diagnosis and treatment of presumptive or confirmed tuberculosis (TB) (active or latent) and complications arising from the TB disease process must be provided at no charge to patients within the NSW public health system. This includes the provision of services for TB related investigations, care and treatment, and management of any disease- or treatment-related complications.

SUMMARY OF POLICY REQUIREMENTS

TB is a notifiable condition under the NSW *Public Health Act 2010*, with doctors required to notify all persons they reasonably suspect to have TB to their local public health unit, and laboratories required to notify all positive results of TB tests.

District and network chief executives are responsible for ensuring appropriately skilled medical and nursing staff are available to manage patients with active or latent TB and provide TB prevention activities to minimise the public health impact of TB. Districts and networks must appoint a TB coordinator to oversee for the provision of TB services within the district or network.

All cases of possible and confirmed TB are to be managed in conjunction with a TB service. All isolates of *M. tuberculosis* complex identified must be referred to the Mycobacterium Reference Laboratory for confirmation and drug susceptibility testing. Treating authorised prescribers must always treat TB disease with multiple antituberculosis agents following the most recent evidence-based practice.

All patients diagnosed with TB in NSW are to be tested for human immunodeficiency virus (HIV). All rifampicin resistant and multidrug resistant TB cases in NSW are to be reviewed by an expert panel.

Patient management must be individualised and seek active input from patients to allow for the least restrictive management that enables them to achieve treatment success. Wherever possible, clinical care is to be delivered in a manner that allows patients to maintain normal employment and/or education activities once non-infectious.

Districts and networks must provide mechanisms to monitor adherence with treatment in a manner that is minimally restrictive to patients, while ensuring treatment success. A mechanism must be available to supervise all prescribed doses for patients identified as being at significant increased risk of treatment non-adherence if required.

All healthcare workers are required to comply with the NSW Health infection control guidance to minimise the risk of TB transmission in healthcare settings.

District and network TB services must quickly identify patients that are putting other people at risk, or are at-risk of such behaviours, and encourage, facilitate, and if required enforce compliance to TB treatment.

TB services are required to undertake contact investigation and screening of contacts.

Districts and networks are required to provide testing for latent TB infection to individuals at risk of acquiring TB infection or those vulnerable to disease progression, including review and follow-up health care workers and students that test positive for latent TB infection.

TB services are to triage, investigate, and provide follow-up care to people referred from the Department of Home Affairs that live within the district or network boundaries, and to provide the required feedback. Districts and networks are required to provide a BCG vaccination service to residents living within the district or network boundaries.

TUBERCULOSIS – MINIMISING THE RISK OF TUBERCULOSIS IN PATIENTS STARTING ANTI TNF INHIBITORS (GL2008_007)

This Guideline is to be read in conjunction with the following Policy Directive:
PD2009_005 *Tuberculin Skin Testing*

Introduction
Tumor necrosis factor (TNF) is a proinflammatory cytokine which has a pivotal role in the pathogenesis of several autoimmune diseases, including rheumatoid arthritis and other inflammatory joint disease, psoriasis, and inflammatory bowel disease.

Three anti-TNF α agents are now available in Australia (infliximab, etanercept, and adalimumab) to treat selected autoimmune diseases. However, TNF α is a significant component of the human immune response to infection1, and treatment with anti-TNF α agents is associated with an increased risk of infection. The development of active Tuberculosis (TB) disease has occurred in some patients who have received anti-TNF α therapy in countries with high TB prevalence2.

The following guidelines have been developed to reduce the risk of active TB developing in patients receiving anti-TNF α therapy.

Before starting ANTI-TNF α inhibitors all patients should have:

1. A careful review of their history of exposure to TB, and an assessment to exclude active TB.
2. A baseline Tuberculin Skin Test for evidence of TB infection.[a]
3. A Chest X ray to exclude active TB and assess evidence of past or current TB.

Latent Tuberculosis
Patients with evidence of latent tuberculosis infection (LTBI) who have not previously received effective treatment for TB and in whom active TB is excluded should be treated with isoniazid (5mg/kg to maximum of 300 mg/day) and pyridoxine (25mg/day) for a period of 9 months3. The first month of isoniazid treatment should be completed prior to starting an anti-TNF α inhibitor. Evidence of LTBI may include:

1. TST ≥ 5 mm
2. Radiological evidence of past TB

Patients with chest x-ray abnormalities, cough or other clinical features suggestive of active TB should have sputum examined for AFBs before commencing treatment with isoniazid.

Physicians should include the risk of potential adverse effects of isoniazid therapy in their assessment of the overall risk of commencing treatment with an anti-TNF α inhibitor.

Monitoring of isoniazid therapy, patients on isoniazid preventive therapy should have monthly assessment of:
- their hepatic function
- their compliance with the prescribed medication, and
- the development of TB.

1. Atkinson YH et al (1988) Recombinant human tumour necrosis factor-alpha. Regulation of N-formylmethionyl-leucylphenylalanine receptor affinity and function in human neutrophils. *J Clin Invest,* 81; 759 – 765

2. Gomez-Reino JJ et al (2003)Treatment of rheumatoid arthritis with tumour necrosis factors inhibitors may predispose to significant increase in tuberculosis risk. *Arthritis & Rheumatism*, 48; 2122 – 2127

a Footnote: While a positive IGRA is good evidence for Latent TB infection a negative IGRA may not exclude TB. Careful consideration must always be used when interpreting TB screening results.

3. Carmona L et al (2005) Effectiveness of recommendations to prevent reactivation of latent tuberculosis infection in patients treated with tumour necrosis factors antagonists. *Arthritis & Rheumatism*, 52; 1766 - 1772

Treatment of TB

Where active TB is diagnosed in a person receiving anti-TNF α therapy:

- cease anti-TNF α inhibitor
- reduce other immunosuppressants to lowest possible effective dose.

Patients with active TB should be referred to a NSW Chest Clinic for management and treatment of TB. Treatment should be in accordance with NSW Health TB treatment guidelines.

TUBERCULOSIS – SPUTUM INDUCTION GUIDELINES (GL2009_006)

Guideline to reduce the risk of occupational exposure to TB during sputum induction procedures. Sputum induction is a procedure used for patients who have trouble producing sputum spontaneously. The patient inhales nebulised hypertonic saline solution, which liquefies airway secretions, promotes coughing and allows expectoration of respiratory secretions. Sputum induction is simple and non-invasive, and if successful, often precludes the need for bronchoscopy.

The procedure produced coughing so it is likely that infectious droplets, if present, will be expelled into the room air. Strict airborne respiratory precautions should be observed whenever sputum induction is performed.

The full guidelines can be downloaded at
http://www.health.nsw.gov.au/policies/gl/2009/GL2009_006.html

TUBERCULOSIS IN CHILDREN AND ADOLESCENTS (GL2005_060)

GL2005_060 rescinds PD2005_069.

Introduction

Tuberculosis (TB) in children and adolescents differs markedly from that in adults.

Many children acquire tuberculosis infection, which is characterised by delayed hypersensitivity and few organisms, but relatively few develop the disease. However, the risk of doing so remains life long. While the initial infection in most children occurs in the lungs, TB in children and adolescents should be considered, at least potentially, to be a systemic disease. The primary complex, comprising the site of infection and the involved regional lymph nodes, may heal or complications may develop from enlargement of these lymph nodes or their rupture and the spread of bacilli into the bloodstream, giving rise to disseminated disease. The risk of dissemination is greatest within the first 12-24 months after infection and in the first 3 years of life.

The following are important aspects of the disease in children and adolescents:

Risk of disease following primary infection

Data derived from studies in the United Kingdom in the 1950's and 60's, for children followed for up to two years after being infected, indicated that the risk of development of radiological changes in the chest consistent with TB infection were greatest in the first year of life and decreased progressively thereafter.1

These studies demonstrated the span of risk for children progressing to active disease over a two year period as follows: children aged less than 1 year - 23 to 43%, children aged 1 to 5 years - 11 to 24%, children aged 6 to 10 years - 8 to 25% and for children aged 11 to 15 years – 16% with females having a higher rate of disease than males.

For children with a normal chest x-ray at the time of their first positive tuberculin skin test the lifetime risk of developing TB is between 2 and 10%. These risks are related to general health, nutrition and other disease states. Although one might expect, with better nutrition and living standards, that currently, the lifetime risk may be lower, there is some Australian data from adult research that indicate that this may not be the case.2

Infectivity

TB in children is primary TB, a disease which is predominantly one of delayed hypersensitivity with few organisms and variable immune response. Childhood TB is rarely contagious because:

- children usually have a small bacterial load;
- children very rarely have cavitating disease; and
- children usually swallow their sputum, and have a far less effective cough than adults.

Rarely children, and occasionally adolescents, may be infectious and have adult type disease.

Diagnosis

Diagnosis of TB infection is based on tuberculin skin testing (TST).

Table 1: Recommended stratification of TST induration size to identify those requiring assessment for preventive therapy. *

The selection of an appropriate cut off for referral is influenced by the probability that the TST represents recent infection and the risk of progression to active disease if there is infection with TB.

1 Miller FJW, Seale RME, Taylor MD. TB in Children. Boston; Little Brown & Co. 1963, page 231 - 232.

2 Marks G, Bai J, Simpson SE, et al. Incidence of Tuberculosis among a cohort of tuberculin positive refugees in Australia. Reappraising the estimates of risk. American Journal of Respiratory Care Medicine 2000; 162: 1851 - 1854.

≥ 5 mm	≥ 10 mm#	≥ 15 mm#
Recent high risk contacts of persons with infectious TB	Born or resident in countries with high prevalence of TB (>50 cases/100,000pp)	Children ≥ 4 years of age without any risk factors
HIV infection or other immune suppressed (including steroids)	Locally identified high risk populations	
TST conversion in the last 2 years	Children < 4 years of age	
Chest X-Ray evidence of past untreated TB	Travel or stay in high prevalence countries	
	Persons with certain medical conditions (eg diabetes; prolonged corticosteroid or immunosuppressive therapy; haematological malignancies (eg Hodgkins, lymphoma); chronic renal failure; low body weight & malnutrition	

* All children < four years of age who have had close contact with a case of infectious TB should receive preventive therapy irrespective of TST response, until the second TST (3 months later) proves negative.

BCG vaccination is unlikely to affect TST interpretation in children vaccinated ≥ 5 years previous. However, where BCG is recent (within 5 years) or where there have been 2 or more BCG vaccinations, the above stratification may need to be modified and the TST results should be interpreted individually by physicians experienced in TB medicine.

Diagnosis of TB disease is based on clinical symptoms and signs, chest x-ray or other investigations and smear and culture of infected body material (if available).

Preventive therapy

Preventive therapy in children with TB infection and no evidence of the disease is used to:

- reduce the lifelong risk of developing TB disease;
- reduce the risk of developing TB disease in the years immediately after acquiring the infection, particularly disseminated disease in children under the age of four years.

Six months isoniazid preventive therapy should be considered for otherwise healthy children and adolescents who have evidence of TB infection and no evidence of TB disease.

The incidence of liver toxicity from isoniazid in children is extremely low and routine monitoring of liver function is not recommended. Prophylactic pyridoxine is not normally recommended with isoniazid in children. Pyridoxine is recommended for children and adolescents on meat and milk deficient diets, those with nutritional deficiencies including all symptomatic HIV infected children, exclusively breast feed infants older than 6 months of age and pregnant adolescents.1

Child contacts of patients with drug resistant TB and especially multi-drug resistant TB should be individually assessed by an expert in TB care and treatment.

Children who have evidence of TB infection and show changes consistent with TB disease on a chest x-ray (including mediastinal lymphadenopathy) should be regarded as having the disease and given full treatment.

1 American Academy of Pediatrics. Tuberculosis. In: Pickering LK, ed.2000 Red Book: Report of the Committee on Infectious Diseases.25th ed. Elk Grove Village, IL: American Academy of Pediatrics; 2000: page 604

Treatment

Children with TB disease should be treated according to the guidelines published in the Journal of Paediatrics and Child Health.1

Directly observed therapy (DOT) should be regarded as the method of choice for TB treatment in NSW. DOT may be undertaken by well-motivated parents. When this occurs, regular contact (at least weekly) with the treating team is essential. Decisions relating to the supervision of TB medication need to be made by the treating team on a case-by-case basis.

TUBERCULIN SKIN TESTING (PD2009_005)

This Policy Directive is to be read in conjunction with NSW Health Department Policy Directives:

PD2013_032 BCG (Bacille Calmette Guerin) Vaccination
PD2005_406 Patient Information and Consent to Medical Treatment
PD2007_036 Infection Control Policy
PD2013_043 Medication Handling in NSW Public Health Facilities
PD2008_017 Tuberculosis Contact Tracing
PD2015_011 Immunisation Services - Authority for Registered Nurses and Midwives
GL2005_060 Tuberculosis in Children and Adolescents

1. Introduction

The procedures incorporated in this document are required to be complied with.

1.1 Definitions

The tuberculin skin test (TST) is used primarily to identify people infected with *Mycobacterium tuberculosis (MTB)*. It is used to identify such people because they have a 5-10% lifetime risk of developing TB disease[1]. TST should therefore be targeted to those individuals at risk either of acquiring TB infection or of progressing to TB disease, once infected.

Preventive treatment of people infected with MTB reduces their risk of developing TB disease by up to 90%[2].

1.2 Composition and Safety

The form of tuberculin used in Australia is purified protein derivative (PPD). PPD consists of bacteria-derived protein without viable organisms and is safe for use in immune compromised persons and in pregnancy.

1.3 Methods of TST Administration

In Australia, tuberculin skin testing is administered by the Mantoux method which involves the intradermal injection of 5 Tuberculin Units (TU) of PPD. Multiple puncture tests are also available to test the cell-mediated response to a variety of antigens including PPD. However, these are not recommended as an alternative to the TST as the dose is less precise and operator variability may be greater.

1 VOSS LM, et al. Position Paper Management of tuberculosis in children. Journal of Pediatrics and Child Health (2000) 36, 530 – 536.

2. Indications/Contra-indications regarding TST

2.1 General Indications for TST

TST is routinely recommended for the following persons:

- people identified as close contacts of persons with infectious TB (as defined in Policy Directive PD2008_017 Tuberculosis Contact Tracing);
- health care and other workers in whom surveillance is proposed because of ongoing increased risk of acquiring infection;
- people with medical risk factors that increase the likelihood of latent infection progressing to disease;
- prior to BCG vaccination in those over 6 months old; and
- in certain clinical situations, to assist in diagnosing or excluding TB disease.

2.2 Contra-indications to TST

TST is best avoided in:

- persons who report any severe adverse reaction following previous TST;
- persons previously treated for active TB disease;
- persons with documented/known prior positive TST reactions;
- persons with a high fever or recent significant infection, eg measles and chicken pox;
- following recent immunisation with MMR, varicella and yellow fever within the last month as the risk of a false negative TST result is increased. Oral typhoid and oral polio (OPV) vaccines do not necessitate a delay in testing (OPV is no longer used in Australia but have been received overseas);
- the 9th edition of the Australian Immunisation Handbook does not mention oral rotavirus vaccination in the context of TST tests, but as with other live oral vaccines, there should be no need to modify timing of TST based on administration of this vaccine.[3]

An undocumented history of a prior positive TST is not an absolute contra-indication to TST because patient recall is often inaccurate.

3. Methods

3.1 Who may administer TST?

- Medical Practitioners;
- Registered Nurses employed in an Area Health Service who have the requisite Authority as defined in the NSW Health Department PD2015_011 Immunisation Services – Authority for Registered Nurses and Midwives. These nurses may undertake TST following NSW Health Department Policies without the written order of a medical practitioner; and
- Registered Nurses who work under the written order of a medical practitioner, as PPD is a schedule 4 drug.

All health professionals performing TST should be appropriately trained to administer and interpret the test results.

3.2 Procedure for the administration of a TST

3.2.1 Confirm the identity of the patient to be tested

3.2.2 Obtain consent

- Informed consent is required. Verbal consent is sufficient, signed consent forms are not required for minor procedures such as TST administration;
- the procedure must be explained to the patient and documented in the patient's medical record - see PD2005_406 Patient Information and Consent to Medical Treatment.

3.2.3 For consent to be valid

- The person must have the capacity to give consent, that is the person must be able to understand the implications of having the treatment or procedure;
- the consent must be freely given;
- the consent must be specifically for the procedure that is being undertaken; and
- the patient must be informed in broad terms of the procedure that is intended.

A person is incapable of giving consent if he/she cannot understand the general nature and effects of the proposed treatment, including implications and possible side effects or:

- is a child is under the age of 14 years, (consent of the parent or legal guardian is necessary); and
- is a school student, without written parental/guardian consent prior to an on-site school screening activity, regardless of age.

Note: while children between the ages of 14 and 16 may give consent, it is prudent to obtain consent of the parent or guardian.

3.2.4 What to do when a person is incapable of giving consent:

The provisions of the *Guardianship Act* apply to a person who is 16 years or older who is incapable of giving consent to the carrying out of medical or dental treatment.

TST is considered "medical treatment" within the meaning of the *Guardianship Act* (section 33(1)). TST falls within the meaning of "minor treatment" under the *Guardianship Act*.

Section 36 of the *Guardianship Act* provides that for minor medical treatment consent may be given by the "person responsible" for the patient or by the Guardianship Tribunal. The person responsible for the patient is defined under section 33A of the Act.

Consent to undertake TST should be obtained in writing from the person responsible.

Minor treatment may be carried out without any consent if there is no person responsible for the patient, or there is such a person, but that person cannot be contacted or is unable or unwilling to make a decision concerning a request for that person's consent for the treatment providing the medical practitioner supervising the carrying out of the TST certifies in writing in the clinical record that:

- the treatment is necessary and undertaking the TST will promote the patient's health and well being; and
- the patient does not object to the carrying out of the TST.

Section 33(3) of the Act provides guidance on the definition of what constitutes a patient objecting to treatment.

Where it is necessary to obtain consent of the Tribunal legislation requires that applications for consent are made in respect of each patient concerned. Prior to granting consent the Tribunal considers the views of the patient, the person proposing the treatment, any person responsible for the patient, and any guardian appointed with respect to the patient's treatment.

4. Pre TST Assessment

Obtain a history or documentation of the following:

- prior TB;
- any potential TB exposure;
- any previous TST and the result;
- BCG vaccination;
- medical conditions or treatment that may effect the TST result as outlined in section 10; and
- review the contraindications for TST as outlined in section 2.2.

5. Administration of the TST

5.1 Position

Seat the patient with the left arm resting on a table. Young children should be seated on their attendant's lap with other arm held securely under the attendant's arm. The child's body is held firmly and at the same time the attendant holds the arm on which the test is to be carried out, slightly flexed.

5.2 Site

The anterior aspect of the left forearm at the junction of the upper and middle thirds, using an area away from blood vessels or skin lesions.

5.3 Dose of PPD for adults and children

Five (5) Tuberculin Units (TU) per 0.1ml is the standard dose for the TST.

5.4 Technique

Use either a single-use insulin syringe with a 29-gauge needle or a 1 mL single-use syringe with 26 or 27 gauge needle. Administer the PPD intradermally with the bevel of the needle uppermost. Inject slowly to produce a pale discrete "bleb" (lump) 5 to 10 mm in diameter. If leakage occurs, repeat the injection at another site at least 5 cm away or in the other forearm.

Repeated TSTs at exactly the same site may result in increased reaction. For this reason the requirement to vary the test site is particularly important in serial or repeated TSTs especially with the 2-step protocol[4].

5.5 Advice to the patient

The patient should be given clear instructions and an information sheet advising of the following:

- not to cover the site with dressings;

- not to apply any lotions to the area;
- to avoid scratching the site if it becomes itchy;
- possibility of skin blistering and/or ulceration following the TST;
- when to return for reading of the TST; and
- to contact the clinic if concerned in the interim.

5.6 Infection control

All procedures should follow the current NSW Health Department PD2007_036 Infection Control Policy.

6. Storage of PPD

- PPD should be stored away from light at 2-8 degrees Centigrade. Discard product if exposed to freezing.
- PPD should be administered as soon as possible after drawing up into the syringe and following administration, as the solution can be adversely affected by exposure to light. PPD remaining in a vial may be kept in the refrigerator and used for up to 30 days before discarding, providing care is taken to avoid contamination of the vial[5]. It is essential that the date the vial is opened be recorded to ensure disposal occurs within the recommended timeframe.

7. Adverse reactions

Adverse reactions to TSTs are rare. They include:

- vaso-vagal reactions;
- immediate flare with a local rash;
- blistering and/or ulceration at the site of the injection;
- lymphangitis; and
- serious or life-threatening hypersensitivity reactions. These are extremely rare (0.08 reactions per million doses of PPD)[6]

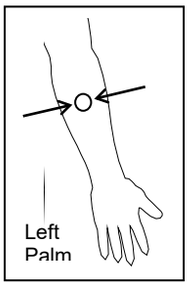
Although the risk of anaphylaxis is very low, adrenaline (and information re its dosage and administration) must be available when TST is being undertaken[7].

8. Pregnancy

There is no evidence that TST poses any risk in pregnancy and/or when breastfeeding an infant[8] or that tuberculin reactions are influenced by pregnancy[9].

9. Reading

The tuberculin skin test should be read 48 to 72 hours after the injection, by measuring the diameter of **induration** across the transverse axis of the forearm.



Only the induration should be measured, not the erythema (redness).

Record the TST results in millimetres (mm) of induration, not as **positive** or **negative**. A tuberculin skin test with no induration should be recorded as **0 mm**.

The tuberculin skin test is to be read by the "pen technique".

Slowly draw a line with a ballpoint from a point 2 to 3 cms away from the margin of the skin test reaction, towards its centre. Maintain skin tension by exerting slight traction in the opposite direction to the pen movement.

When the ballpoint reaches the margin of the indurated area you will feel definite resistance, lift the pen. Repeat the procedure from the opposite side of the reaction. Measure the distance between opposing lines with a ruler.

9.1 Documentation

Document in the patient's medical record:
- the date the TST was administered;
- the dose of PPD administered;
- the batch number and expiry date of the PPD;
- BCG vaccination history, including age or ages at vaccination;
- the presence or absence of BCG scars;
- date the TST was measured;
- size in mm of the transverse diameter of induration;
- presence of vesiculation; and
- signature of the person administering the TST and reading the result.

10. Interpretation of TST results

The TST result should be interpreted in light of factors that increase the probability that the patient has been infected with TB. These include:
- recent high risk (close) contact with persons with infectious TB;
- residence in countries with high prevalence of TB (>50 cases/100,000 persons);
- persons with chest x-ray evidence of past, untreated TB;
- prior or current residence in high-risk congregate settings (eg. prisons, homeless shelters, alcohol rehabilitation and drug treatment centres);
- prior vaccination with BCG;
- intravenous drug use;
- health care workers; and
- exposure to mycobacteria other than TB (MOTT).

The TST result may be decreased by:
- immuno suppressive therapy, malignancy and HIV/AIDS[10];
- acute viral or bacterial infections, including 5-17% of persons with active TB[11];
- infancy, advanced age[12], renal failure[13] or significant malnutrition[14], and
- recent (within 4 weeks) live virus vaccinations[15].

Note that technical factors also influence the TST induration size. Such factors include:
- variation in the storage, handling and dosage of PPD used; and
- errors in administration or reading.

10.1 Prior vaccination with BCG

Most people vaccinated with BCG will develop, within 2 months, a TST reaction which will then wane variably over time. TST following BCG vaccination is not recommended to assess the effectiveness of BCG.

BCG vaccination given in infancy is unlikely to affect TST interpretation in adults[16]. Where BCG has been given in the last 5 years or more than one BCG has been administered the interpretation of TST results needs to be undertaken by a physician with experience in TB medicine[17].

TST reactions > 20mm are rarely due to BCG alone[18].

10.2 Evidence of TST conversion

Where serial tests are done a TST conversion is defined as an increase in the diameter of TST induration of ≥ 10mm, between consecutive readings[19]. This increase usually occurs in 4 – 8 weeks following exposure to TB.[20]

TST conversion indicates recent TB infection. Occasionally false positive conversions may occur due to the TST booster phenomenon. The 2-step TST may assist in distinguishing true conversions from the booster phenomenon (see section 11 – Two-step TST and the Booster Phenomenon).

10.3 The size of the TST induration

The interpretation of TST reactions to identify those requiring assessment for preventive therapy is based on: (a) the probability that the TST represents recent infection and (b) the risk of progression to active disease if there is infection with MTB.

Note that all children < 4 years of age who have had close contact with a case of infectious TB should receive preventive therapy irrespective of TST response, until the second TST (3 months later) proves negative (See GL2005_060 - TB in Children and Adolescents).

Table 1. TST induration diameter which should be considered indicative of infection with MTB in various clinical settings

≥5mm	≥10mm#	≥15mm#
Recent high risk (close) contacts of persons with infectious TB	Persons born or resident (for greater than 3 months) in countries with high prevalence of TB (>100 cases/100,000)	People > 4 years of age without any identified risk factors
Persons with HIV infection	Children < 4 years of age without any identified risk factors	Health Care Workers with BCG vaccination in the past 10 years
Persons with organ transplants or immune suppressive therapy equivalent to prednisone >15mg/day for >1 month	Persons who live or spend time in high risk congregate settings (eg prisons, homeless shelters, alcohol rehabilitation and drug treatment centres	
Persons with CXR evidence of past untreated TB	Health care workers without prior BCG vaccination in the past 10 years	
	Intravenous drug users	
	Persons on prednisone equivalent to ≥15mg/day or for ≥1 month or those with certain medical conditions eg diabetes; silicosis; some malignancies (head, neck, lung and haematological); chronic renal failure; gastrectomy or jejunal bypass; malnutrition or low body weight (>10% below ideal body weight)[21]	

BCG vaccination is unlikely to affect TST interpretation in adults, if given in infancy. However, where BCG is recent (within 5 years) or where there have been 2 or more BCG vaccinations, the above stratification may need to be modified and TST results should be interpreted individually by physicians experienced in TB medicine.

10.4 TST positive persons

The recommended management for persons identified as TST positive is either preventive therapy or chest x-ray follow up.

If preventive therapy is not given, the person is to be counselled about the future risk of TB and to seek medical care if symptoms develop. Chest x-ray follow up is required in three to four months and then annually for two years. The risk of developing tuberculosis is highest within the first two years.

11. Two-step TST and the Booster Phenomenon

In some people previously exposed to *Mycobacteria* the ability to mount an immunological response to mycobacterial antigens wanes over time. These individuals may not initially react to a TST, but the TST may boost immunological memory for the mycobacterial antigens. If this does occur, a repeat TST shortly after the initial one will produce a much larger TST response (a boosted response). The initial TST result is therefore falsely negative and the second result should be considered the true result. However, this boosting phenomenon may be misinterpreted as a TST conversion.

The TST boosted response is maximal 1-5 weeks after the first TST, but can persist for 1-2 years[22]. A 2-step TST is designed to avoid false negative baseline TSTs, so a subsequent positive TST is not misinterpreted as a TST conversion. The second TST of the 2-step procedure should be done 1-5 weeks after the initial negative TST. The results of the second TST should be taken as the baseline for future assessment of TST conversion.

The 2-step TST is ideally suited to the situation of health worker screening where it is expected that there will be repeat testing at future regular intervals, and it is desirable to identify booster phenomena so as not to confuse the results with genuine TST conversion in health care workers. The 2-step TST is not routinely recommended in contact tracing.

12. Alternative/in vitro tests

Interferon-y-release-assays such as the QuantiFERON tests (Cellestis Limited, Carnegie, Melbourne), are assays that detect cell mediated immune (CMI) responses to TB specific proteins that are secreted by the *M.tuberculosis* organism. These CMI responses are demonstrated to be both specific for *M.tuberculosis* infection and have less cross-reactivity with BCG and most non-tuberculosis mycobacteria.

The QuantiFERON - TB Gold® assay has been evaluated for use with immune competent healthy adults. A result of greater than 0.35IU/ml of interferon to the specific antigens indicates TB infection.

The assay has not been evaluated for use within children aged < 12 years, infants, pregnant women, immunocompromised individuals (HIV positive individuals), or people with certain clinical conditions predisposing immunosuppression (i.e. diabetes, silicosis, cancers, organ transplants), or those taking immunosuppressive medication. Studies are currently underway to assess the performance of QuantiFERON - TB Gold® within these groups.

The US Center for Disease Control and Prevention state in the Morbidity and Mortality Weekly Report of 16 December 2005/54/No.RR-15, that the QuantiFERON - TB Gold® assay may be used in certain circumstances to diagnose LTBI. However, the National Tuberculosis Advisory Committee is currently evaluating the results of international studies to determine the recommendations for use of QuantiFERON - TB Gold® in Australia. The TST continues to be the recommended methodology for diagnosing LTBI and QuantiFERON TB Gold® is not recommended for assessment of LTBI[23].

Persons referred to NSW TB Prevention and Control Services for evaluation of LTBI following screening with QuantiFERON - TB Gold® must have their results assessed in conjunction with other clinical and laboratory information to determine the risk of TB infection and/or active TB. It is not considered necessary to undertake a TST in this group of people.

BACILLE CALMETTE-GUERIN (BCG) VACCINATION (GL2023_003)

GL2023_003 replaced PD2013_032

GUIDELINE SUMMARY

This Guideline sets out the recommendations for use of the bacille Calmette-Guérin (BCG) vaccination in NSW.

BCG vaccination has an important role in prevention of travel-acquired tuberculosis (TB) in young children from diverse backgrounds born in NSW and has a more limited role in overall prevention of TB in a low TB incidence setting such as Australia.

KEY PRINCIPLES

Bacille Calmette-Guérin (BCG) vaccination is to be used in accordance with the National Health and Medical Research Council (NHMRC) Australian Immunisation Handbook and as per the recommendations in these guidelines.

A pre-vaccination risk assessment is required to determine whether BCG vaccination should occur, and whether a pre-vaccination tuberculin skin test (TST) is required.

Comprehensive education must be provided to the vaccine recipient, or their parents/ care givers and consent sought. BCG vaccinators must be appropriately credentialled and experienced in intradermal administration.

Mechanisms must be in place to report vaccinations to the Australian Immunisation Register, and to manage and report adverse events following immunisation including accelerated reactions. Local Health Districts and Specialty Health Networks are responsible for assessing, maintaining, and reassessing their capability level to deliver BCG vaccination to their community, as per the NSW Health Policy Directive *Principles for the Management of Tuberculosis in New South Wales* (PD2022_007).

The Bacille Calmette-Guérin (BCG) Vaccination guideline is available at:
https://www1.health.nsw.gov.au/pds/Pages/doc.aspx?dn=GL2023_003

345(13/02/23)

TUBERCULOSIS CONTACT INVESTIGATIONS (GL2019_003)

GL2019_003 rescinds PD2008_017

PURPOSE

Contact investigation is an essential component of tuberculosis (TB) prevention. The rationale for contact investigation is that people who were recently exposed to patients with TB may have become infected and will have an increased risk of developing TB disease, particularly within the first two years after acquisition of the infection.

Decisions about the extent of contact investigation need to be guided by sound clinical and epidemiological indications. The aims of contact investigation are to:

- Identify and treat cases of TB disease among those in contact with the index case including identification of a possible source case;
- Identify persons who have latent TB infection (LTBI) and offer treatment for LTBI or monitoring by chest radiography (CXR);
- Provide timely treatment, education and support for persons identified with evidence of disease or infection, and;
- Provide education and support for all persons identified as having exposure risk.

KEY PRINCIPLES

Individuals have a right to be informed about significant risks to their health and recommended courses of action to manage these risks.

The priorities for TB contact investigation are determined by:

- The likely infectiousness of the index case;
- The risk of exposure of contacts to the index case, and;
- The vulnerability of contacts to disease progression.

Contacts should be prioritised according to their risk of exposure to an infectious TB case and their level of risk for disease progression; screening should be conducted in a stepwise fashion using the concentric circles model until no evidence of transmission is found.

Typically, household contacts are highest priority but consideration must be given to close non-household contacts and vulnerable contacts, regardless of their level of exposure.

Treating clinicians are responsible for individual case management with NSW TB services to support adherence to the prescribed treatment therapy or chest radiograph surveillance.

USE OF THE GUIDELINE

TB contact investigations are an important public health activity that should be carried out by the LHD TB Service as part of routine management of a patient diagnosed with TB.

LHD TB Services should:

- Undertake contact investigations for all TB cases
- Notify the NSW TB Program and their local PHU Director of contact investigations where:
    - Screening involves a healthcare facility or educational institution;
    - Screening that may attract media interest or may cause large scale public concern;
    - Large screenings (where more than 25 contacts at high risk of exposure are identified); and
    - Situations where a high or medium infectiousness index case spent greater than eight hours on an aircraft, and
    - Contact investigations that cross state and/or international jurisdictional borders.
- Communicate with representatives of all relevant jurisdictions (including interstate TB services where relevant) where contact investigations cross jurisdictional boundaries
- Provide sufficient information to ensure appropriate screening of contacts, and ongoing management for those identified as having LTBI or TB disease

- Complete summary contact investigation data on the Notifiable Conditions Information Management System (NCIMS)
- Undertake a routine review process of the quality and completeness of contact investigations.

LHD Public Health Units should:

- Provide assistance including surge capacity, data management, public communication support and assistance with decision making around the investigation where requested by the LHD TB Service
- Facilitate public health inquiries under section 106 of the *Public Health Act.*

The NSW TB Program should:

- Provide advice on large and/or complex contact investigations as requested
- Convene an expert panel where required to support the contact investigation for large and/or complex situations
- Report on contact investigation indicators.

The complete Guideline is available at:
https://www1.health.nsw.gov.au/pds/Pages/doc.aspx?dn=GL2019_003

NSW ABORIGINAL BLOOD BORNE VIRUSES AND SEXUALLY TRANSMISSIBLE INFECTIONS FRAMEWORK 2016-2021 (IB2016_020)

IB2016_020 replaces GL2007_002

PURPOSE

This Information Bulletin advises that the Information Bulletin IB2016_015 *NSW Aboriginal Blood-Borne Viruses and Sexually Transmissible Infections Framework 2016-2020* has been rescinded, and superseded by the *NSW Aboriginal Blood Borne Viruses and Sexually Transmissible Infections Framework 2016-2021*.

KEY INFORMATION

The Aboriginal BBV and STI Framework 2016-2021 outlines the priorities for BBV and STI prevention, testing, treatment and management for Aboriginal people in priority settings including Aboriginal Community Controlled Health Services (ACCHSs) and other primary health settings, Local Health Districts (LHDs) and Non-Government Organisations (NGOs).

Implementation of this Framework in conjunction with the NSW HIV Strategy 2016-2020, NSW STI Strategy 2016-2020, NSW Hepatitis B Strategy 2014-2020 and NSW Hepatitis C Strategy 2014-2020, will support the achievement of health equity for Aboriginal people in NSW.

The Framework is aligned to support achievement of the goals and targets of the *National Aboriginal and Torres Strait Islander Blood-Borne Viruses and Sexually Transmissible Infections Strategy 2014-2017*.

To view the NSW Aboriginal Blood Borne Viruses and Sexually Transmissible Infections Framework 2016-2021 please go to
https://www1.health.nsw.gov.au/pds/Pages/doc.aspx?dn=IB2016_020#

301(06/05/16)

NEONATAL AND INFANT HEPATITIS B PREVENTION AND VACCINATION PROGRAM (PD2023_032)

PD2023_032 replaced PD2017_036

POLICY STATEMENT

NSW Health is committed to reducing the risk of hepatitis B transmission to neonates born in NSW. This Policy Directive focuses on the screening of all pregnant women for hepatitis B disease, appropriate referral to a specialist hepatology service/ specialist hepatologist as required, and the follow-up and management of all infants born to hepatitis B surface antigen (HBsAg) positive women.

SUMMARY OF POLICY REQUIREMENTS

This Policy Directive must be read in conjunction with the current edition of The Australian Immunisation Handbook.

The Policy Directive aims to ensure consistent implementation of the NSW Neonatal and Infant Hepatitis B Prevention and Vaccination Program in all local health districts; and applies to NSW ante- and post-natal services, maternity hospitals, and public health units within the local health district.

All maternity facilities must offer hepatitis B surface antigen (HBsAg) screening and referral where appropriate to all pregnant women. HBsAg positive pregnant women with a high viral load (>200,000 or 5.3 log10 IU/mL) are recommended to be referred to a hepatology service/ specialist hepatologist.for management and follow up. HBsAg positive pregnant women with a low viral load (≤200,000 or 5.3 log10 IU/mL) can be managed by either their general practitioner or hepatology service.

All maternity facilities are required to offer Hepatitis B immunoglobulin (HBIG) to all neonates born to HBsAg positive mothers within 12-hours of birth. In addition, all neonates regardless of mothers HBsAg status must be offered the hepatitis B vaccine within 7-days of birth.

For reporting requirements, all maternity facilities are required to enter hepatitis B data onto eMaternity or Cerner as appropriate and report regularly to their Local Health District

The Neonatal Hepatitis B Hospital Coordinator must forward a copy of the Neonatal and Infant Hepatitis B Follow Up Letter to the LHD Neonatal and Infant Hepatitis B Lead and the mother's nominated doctor, if known to assist with following up babies born to a HBsAg positive mother.

In addition, the Neonatal Hepatitis B Hospital Coordinator must complete the Maternity Unit Record Form for every infant born to a HBsAg positive mother. The completed form must be sent to the LHD Neonatal and Infant Hepatitis B Lead to ensure all reporting and monitoring responsibilities are met.

The LHD Neonatal and Infant Hepatitis B Lead is required to send a copy of the *Neonatal and Infant Hepatitis B Follow Up Letter to General Practitioners* and the *Maternity Unit Record Form* to the local PHU Immunisation Coordinator for monitoring and follow up of vaccination course completion.

All neonates born to HBsAg positive mothers outside of NSW Health facilities should be notified to the local public health unit to assist with monitoring the completion of their primary hepatitis B vaccination course.

Following collection of the data, the local health district is responsible for reporting program performance and follow-up all neonates born to HBsAg positive mothers who are overdue for vaccination.

The full Neonatal and Infant Hepatitis B Prevention and Vaccination Program policy is available at https://www1.health.nsw.gov.au/pds/Pages/doc.aspx?dn=PD2023_032

AUTHORISED NURSE IMMUNISERS AND AUTHORISED MIDWIFE IMMUNISERS (PD2023_027)

PD2023_027 replaced PD2022_016

POLICY STATEMENT

NSW Health is committed to improving immunisation coverage rates and achieving national goals and targets. The immunisation status of community members is seen to be greatly improved if registered nurses and midwives, who have specialised training, are able to provide vaccination services that are complementary to those performed by medical practitioners and nurse practitioners.

This Policy Directive applies to Authorised Nurse Immunisers and Authorised Midwife Immunisers only. It is not applicable to registered nurses and midwives who have not completed the specified training but who may administer vaccines under the direction and authorisation of a medical officer or nurse practitioner.

SUMMARY OF POLICY REQUIREMENTS

NSW Health organisations must have processes in place to ensure Authorised Nurse Immunisers and Authorised Midwife Immunisers employed by their organisation are currently registered with the Australian Health Practitioner Regulation Agency (AHPRA) and legally able to practice within the scope of their registration in NSW.

To become an Authorised Nurse Immuniser or Authorised Midwife Immuniser, a registered nurse/ midwife must have successfully completed the recognised training stated in this Policy Directive.

Further training is required for Authorised Nurse Immunisers and Authorised Midwife Immunisers:

- supplying or administering a SARS-COV-2 (COVID-19) vaccine; OR
- working in, or in conjunction with, NSW TB Services, to supply and administer Tuberculin and the Tuberculosis vaccine (BCG).

Authorised Nurse Immunisers and Authorised Midwife Immunisers must administer vaccines as recommended by the National Health and Medical Research Council, and in accordance with the Australian Immunisation Handbook.

All vaccinations and restricted substances are stored in accordance with the National Vaccine Storage Guidelines 'Strive for 5'.

Authorised Nurse Immunisers and Authorised Midwife Immunisers are to have a complete anaphylaxis kit with in-date adrenaline for use in the treatment of anaphylaxis and ensure that procedures for the administration of adrenaline comply with the Australian Immunisation Handbook

The Authorised Nurse Immuniser or Authorised Midwife Immuniser must report each adverse event following immunisation to the local Public Health Unit and ensure that a designated medical officer is contactable for medical advice.

All vaccinations administered must be recorded on the Australian Immunisation Register (AIR) and the Authorised Nurse Immuniser or Authorised Midwife Immuniser must maintain authority to immunise.

The full Authorised Nurse Immunisers and Authorised Midwife Immunisers policy is available at: https://www1.health.nsw.gov.au/pds/Pages/doc.aspx?dn=PD2023_027

STATEWIDE STANDING ORDERS FOR THE SUPPLY OR ADMINISTRATION OF MEDICATION FOR PUBLIC HEALTH RESPONSE (PD2016_035)

PD2016_035 rescinds PD2013_035.

PURPOSE

The public health response for people exposed to an infectious or otherwise hazardous agent may include the urgent provision of prophylactic medication. In addition, in some circumstances, the public health response includes urgent provision of a medication to treat a person who already has the infection.

The Policy Directive - *Statewide Standing Orders for the Supply or Administration of Medication for Public Health Response* authorises an appropriately educated registered nurse to administer and / or supply specified medications and sets out procedures for dispensing, supplying and administering medications for the purpose of treatment or prophylaxis against certain notifiable conditions or to those who fit an agreed case definition. This Policy Directive when activated for public health response, applies where provision of medication is required as a result of exposure to certain notifiable conditions. Settings may include health facilities where availability of an authorised prescriber would delay a timely response, residential care facilities, airports, schools, or workplaces.

MANDATORY REQUIREMENTS

This Policy Directive does not require further authorisation by Institutional / Local Health District Drug and Therapeutics Committees and overrides any inconsistent local policy.

This standing order will be submitted to the NSW Therapeutic Advisory Group for review annually by Health Protection NSW.

IMPLEMENTATION

Roles and Responsibilities

NSW Ministry of Health:

- Ensure the mandatory requirement for annual review by the NSW Therapeutic Advisory Group.

Chief Executives, Health Service Executives, Managers:

- Ensure services and personnel are aware of their roles and responsibilities under the policy.

Public Health Unit Director:

- Ensure that local protocols and procedures are in place to support implementation of the policy
- The Standing Order activation section is completed prior to each occasion of use
- In order to fulfil the standing order, dispensing of medications will need to be arranged with a public hospital pharmacy department, on behalf of the public health organisation, and at the request of the Public Health Officer (if a medical officer) or an authorised prescriber designated by the district's public health unit director / Public Health Officer.

Medical Public Health Officer:

- The Medical Public Health Officer must check the medication record (Section 8.2 or 8.3) documenting the drug supply and CONFIRM BY SIGNING this entry WITHIN 24 hours.

1. BACKGROUND

1.1 About this document

The *Statewide Standing Orders for the Supply or Administration of Medication for Public Health Response* authorises a registered nurse to administer and / or supply for administration specified medications and sets out procedures for ordering, dispensing, supplying and administering medications for the purpose of treatment or of prophylaxis against certain notifiable conditions or to those who fit an agreed case definition.

This Policy Directive is intended for use by registered nurses employed in a public health organisation for the supply or administration of medication for Public Health response in 'off site' settings to the public health organisation. In the case of administration of vaccines for a public health response, although it is desirable, it is not mandatory for the registered nurse to be an Authorised Nurse Immuniser. Settings may include health facilities where availability of an authorised prescriber would delay a timely response, residential care facilities, airports, schools, or workplaces.

Competency to administer medications is included in the qualifications of medical practitioners, dentists, nurse practitioners, midwife practitioners, registered nurses, and registered midwives, but only in accordance with any practice conditions imposed by the person's place of employment and the endorsements, notations and conditions on the person's registration.

The following statewide standing orders are for:

- The management of influenza cases and contacts
- The management of meningococcal disease contacts
- The management of measles contacts
- The subsequent use of adrenaline (epinephrine) to treat anaphylaxis.

1.2 Key definitions

Case	Individual diagnosed with a condition meeting standard defining criteria.
Contact	Individuals who meet the definition of a contact for a specified disease as documented in public health guidelines.
Clearance	Use of medication to prevent secondary cases, through elimination of the bacteria from possible carriers in the defined network of close contacts of each case.
Medical Public Health Officer	*Public Health Officer under the Public Health Act* (who is a medical officer), or a medical officer designated by the District's Public Health Unit Director / Public Health Officer.
Medication	Used singularly throughout the Policy to describe a drug, medicine, pharmaceutical preparation (including a compounded preparation), therapeutic substance, and vaccine.
Prophylaxis	Use of medication to prevent illness in contacts of a known case of disease.
Public health organisation	A local health district, or statutory health corporation, or an affiliated health organisation in respect of its recognised establishments and recognised services.
Registered Nurse	Includes nurses and midwives registered with the Nursing and Midwifery Board of Australia.
Supply	To administer or dispense medications to a group or a specific patient and is consistent with the definition of supply in section 3 of *the Poisons and Therapeutic Goods Act 1966*. Includes administration of a single dose or medication pack dispensed for treatment or prophylaxis by a Registered Nurse.
Treatment	Use of medication to treat an individual case of disease

1.3 Legal and legislative framework

Section 121 of the *Public Health Act 2010* allows the Secretary of the NSW Ministry of Health to appoint individuals to the position of Public Health Officer for a part of the State or for the purpose of exercising particular public health functions. These functions include the investigation of matters affecting public health and coordinating activities in relation to the reduction of any risks to public health in that part of the state.

Clauses 170 and 171 of the Poisons and Therapeutic Goods Regulation 2008 allow the Secretary of the NSW Ministry of Health to authorise (for the purposes of the Act) a particular person (by means of an instrument in writing given to the person) or a specified class of persons (by means of an instrument published in a manner approved by the Secretary) to supply restricted substances according to clause 53 of the regulation. The authorisation only applies to registered nurses or midwives employed by a public health organisation for the medications listed in the standing orders included in this policy.

2. IMPLEMENTATION OF STATEWIDE STANDING ORDERS FOR PUBLIC HEALTH RESPONSE

When a statewide standing order is applied, public health organisation executives are to ensure:

A registered nurse operating under this standing order is aware of their responsibility to:

- ☐ Determine whether the patient meets the criteria for the standing order and explain the treatment and its purpose to the patient (or guardian)
- ☐ Check that the patient is not showing signs and symptoms requiring immediate medical review and contact the medical officer or refer to the emergency department for immediate review as required
- ☐ Determine any known allergies, hypersensitivity to the medication or contraindications to treatment and contact the medical officer to discuss how to proceed
- ☐ Obtain patient / guardian consent from the patient receiving treatment. Nurses or midwives who are authorised to initiate medications have the same obligations as medical practitioners when obtaining consent for the procedures which they are authorised to perform
- ☐ Document all assessments and details relating to the supply or administration of medication
- ☐ Remain competent in cardio-pulmonary resuscitation, and the administration of adrenaline (epinephrine) in the management of anaphylaxis
- ☐ Practice under the Policy Directive PD2013_043 - *Medication Handling in NSW Public Health Facilities*
- ☐ Record the name of the person and the date the medication is supplied to the patient on the medication label at the time of supply - where this information is not available at the time of supply from the hospital pharmacy
- ☐ Record the administration / dispensing of each medication (see sections 8.1, 8.2 and 8.3) and
- ☐ Ensure records relating to the administration / dispensing of medication are retained in accordance with the State Records Authority General Retention and Disposal Authority for Public Health Services: Patient / Client Records (GDA 17).

The Medical Public Health Officer is aware of their responsibility to:

☐ Brief the registered nurse on the relevant section of the Standing Order and complete the Standing Order activation section prior to each occasion of use

☐ Arrange dispensing of medications with the public hospital pharmacy department, including the estimated quantity required

☐ Be able to be contacted to provide advice to the registered nurse during the treatment or prophylaxis program, and

☐ Check the medication record (section 8.2 or 8.3) documenting the drug supply and confirm by signing this entry within 24 hours.

The public hospital Pharmacy Department is aware of their responsibility to:

☐ Label all medication that is to be supplied for dosing at a later time with the name(s) and strength(s), active ingredient(s) of the medication and the directions for use, including duration of use and other required information. If known, the patient's name must be included on the label. Additional information that should also be supplied includes the Consumer Medicine Information (Full manufacturers product information accessible via CIAP).

3. MEDICATIONS FOR TREATMENT OF INFLUENZA

Purpose

This standing order sets out procedures for ordering, supplying and administering the anti-influenza medications oseltamivir (Tamiflu®) and zanamivir (Relenza®), for the purpose of treatment of influenza.

This standing order authorises a registered nurse, who practices in accordance with the requirements set out in section 2, to administer and/or supply the specified medications for the treatment of influenza to those who fit the agreed clinical case definition of influenza-like-illness according to NSW Health Public Health Response Guidelines[1] or on laboratory diagnosis of influenza. Anti-influenza medications have been shown to attenuate disease in cases of influenza if given early in the course of the illness (within 48 hours of developing symptoms). There may be benefit in providing anti-influenza medications to hospitalised patients after 48 hours.

Medications - oseltamivir and zanamivir

This standing order does **NOT** apply to the following patient groups. A medical officer must approve the supply of anti-influenza medications to these groups:

- Oseltamivir to children under the age of 1 year
- Zanamivir to children under the age of 5 years
- Pregnant or breast-feeding women.

Oseltamivir is approved for use as treatment in children 1 year and older, and zanamivir is approved for use as treatment in children five years and older. The decision to administer to children under these ages should only be taken when the potential benefit is considered to outweigh the risk of harm. In these circumstances the medications must be prescribed by a medical practitioner following consultation with a paediatrician.

Oseltamivir and zanamivir should be used with caution in pregnant or breast-feeding women and only where the potential benefit is considered to outweigh the risk of harm. Treatment may only be prescribed by a medical officer.

If the registered nurse applying the standing order has any concerns regarding patient safety for provision of the medication (e.g. people with significant chronic illness or immunosuppression), the nurse should arrange for the Medical Public Health Officer or emergency department to review so the supply or administration of medication can occur as soon as possible.

Reason for activation: *(Include Index case record number or outbreak response name as applicable)*		

3.2 Standing order for supply of zanamivir (RELENZA®) for TREATMENT

TITLE	Standing order for Influenza TREATMENT
Drug(s)	**Zanamivir (RELENZA®)**
Presentation [1]	**5 mg** powder / blister; four blisters in each Rotadisk. Powder is inhaled by mouth using a delivery device called a DISKHALER
Indication	Zanamivir is approved for use as treatment of Influenza in adults and children 5 years and older
Contraindications[1]	History of hypersensitivity to zanamivir or lactose.
Precautions[1]	▪ Use with caution in pregnant or breast-feeding women and subjects with severe asthma or chronic respiratory disease ▪ Children may not be able to inhale zanamivir properly, resulting in inadequate tissue concentrations.
Dose [1]	10 mg (two 5mg blisters) inhaled
Dose frequency[1]	**TWICE** daily for 5 days
Administration[1]	Refer to the "patient instructions for use" for the Diskhaler use. Patients with asthma should use their bronchodilator prior to using zanamivir. If new onset wheeze develops after using zanamivir, discontinue therapy.
Drug Interactions[1]	No clinically significant drug interactions have been reported in clinical studies to date.
Adverse effects[5]	Adverse effects are rare (0.1%) and include bronchospasm (may be fatal); dyspnoea allergy including oropharyngeal oedema, rash and anaphylactic / anaphylactoid reaction. See Product Information for full list.
Documentation	Obtain consent, explain side effects, and provide Consumer Medicine Information for Relenza and patient information sheet for Relenza.

4. MEDICATIONS FOR THE PROPHYLAXIS OF INFLUENZA

Purpose

This standing order sets out procedures for ordering, supplying or administering the anti-influenza medications oseltamivir (Tamiflu®) and zanamivir (Relenza®), for the purpose of **prophylaxis** of influenza.

This standing order authorises a registered nurse, who practices in accordance with requirements set out in section 2, to administer and / or supply the specified anti-influenza medications for the prophylaxis against influenza to those who fit an agreed case definition.

Prophylaxis should be provided as soon as possible but not if more than seven days has elapsed since the last contact with a probable or confirmed case of influenza. Once it is determined that prophylaxis is required, administration or supply should commence as soon as possible. The clinical condition of all contacts of the confirmed case of influenza should be reviewed prior to administration or supply of prophylaxis to determine whether they have developed symptoms or signs of influenza infection.

Medications - oseltamivir and zanamivir

This standing order does **NOT** apply to the administration or supply of:

- Oseltamivir to children under the age of 1 year
- Zanamivir to children under the age of 5 years
- Pregnant or breast-feeding women.

The decision to administer to children under these ages and pregnant or breast-feeding women should only be taken where the benefit is considered to outweigh the risk, and medication must be prescribed by a medical practitioner including consultation with a paediatrician for children.

If the registered nurse applying the standing order has any clinical concerns regarding patient safety for provision of the medication, the nurse should arrange for the Medical Public Health Officer or emergency department to review so the supply or administration of medication can occur as soon as possible.

4.1 Standing order for supply of oseltamivir (Tamiflu®) for PROPHYLAXIS.

<table>
<tr><td>TITLE</td><td>Standing order for Influenza PROHPYLAXIS</td></tr>
<tr><td>Drug(s)</td><td>oseltamivir (TAMIFLU®)</td></tr>
<tr><td>Presentation [1]</td><td>30 mg, 45 mg and 75 mg capsule
6 mg/mL powder for oral suspension - reconstitute with 55 mL water</td></tr>
<tr><td>Indication</td><td>Oseltamivir is approved for use as prevention of Influenza in adults and children 1 year and older.</td></tr>
<tr><td>Contraindications[1]</td><td>▪ History of hypersensitivity or allergy to oseltamivir, fructose intolerance (this applies to oral suspension only), routine haemodialysis or continuous peritoneal dialysis, subjects with creatinine clearance <10mL/min, history of renal impairment (seek medical advice)
▪ The safety and efficacy of oseltamivir in paediatric patients have not been established in children aged less than 1 year of age.</td></tr>

Reason for activation: *(Include Index case record number or outbreak response name as applicable)*		

4.2 Standing order for supply of zanamivir (Relenza®) for PROPHYLAXIS.

TITLE	Standing order for Influenza PROHPYLAXIS
Drug(s)	**zanamivir (RELENZA®)**
Presentation [1]	**5 mg** powder / blister; four blisters in each Rotadisk. Powder is inhaled by mouth using a delivery device called a DISKHALER
Indication	Relenza is indicated for prophylaxis of infection due to influenza A and B in adults and children (greater than or equal to five years) to reduce transmission among individuals in households with an infected person.
Contraindications[1] and exclusions	History of hypersensitivity to zanamivir or lactose.
Precautions[1]	Use with caution in pregnant or breast-feeding women and subjects with severe asthma or chronic respiratory disease
Dose [1]	10 mg (two 5mg blisters) inhaled
Dose frequency[1]	**ONCE** daily for 10 days
Administration[1]	Refer to the "patient instructions for use" for the Diskhaler use. Patients with asthma should use their bronchodilator prior to usinging zanamivir. If new onset wheeze develops after taking zanamivir, discontinue therapy.
Drug Interactions[1]	No clinically significant drug interactions have been reported in clinical studies to date.
Adverse effects[1]	▪ Adverse effects are rare (0.1%) and include bronchospasm (may be fatal); dyspnoea allergy including oropharyngeal oedema, rash and anaphylactic / anaphylactoid reaction. ▪ Note: there is a warning in the product information regarding an association between zanamivir and neuropsychiatric symptoms (e.g delirium or abnormal behaviour); however, at present, evidence suggests that these rare events are more likely to be due to influenza. ▪ See Product Information for full list.
Documentation	Obtain consent, explain side effects, and provide consumer medicine information and patient information sheet.
Related Documents	NSW Health Influenza Factsheet Consumer Medicine Information for Relenza® Patient Information Sheet for Relenza (section 8.5)

5 CLEARANCE ANTIBIOTICS FOR MENINGOCOCCAL DISEASE

Purpose

This standing order sets out procedures for ordering, supplying or administering ciprofloxacin, ceftriaxone or rifampicin for close contacts of a case of meningococcal disease. Among close contacts, there is often an asymptomatic individual who is carrying the organism that caused the infection in the index case. The purpose of clearance antibiotics is to eliminate meningococci from any carrier in the defined network of close contacts of each case of meningococcal disease, to reduce the risk of further transmission and prevent further cases of invasive disease.

This standing order authorises a registered nurse, who practices in accordance with requirements set out in section 2, to administer and / or supply the specified antibiotics to contacts of cases of meningococcal disease in the seven days prior to onset of illness according to criteria specified in the national guidelines including[1]:

- Household of a case (including sexual partners)
- Child care facilities or family day care where the case of meningococcal disease was in the same room for more than four hours
- School or university contacts who are “household-like” contacts
- Health care workers who have intubated the case without a face mask or done mouth to mouth resuscitation (after onset of illness)
- Contacts in seats adjacent to the case during long distance travel (more than eight hours)

Medication should be provided as soon as practicable to identified contacts, but should not be provided if more than four weeks have elapsed since the last contact with a probable or confirmed case of meningococcal disease.

Medications

Three antibiotics, ciprofloxacin, ceftriaxone and rifampicin, are considered equally effective as clearance antibiotics for use by defined contacts of a case with meningococcal disease.

The recommended medication for specific patient groups[2]:

- Ciprofloxacin is the preferred medication for all age groups and for women on the contraceptive pill.[3] Ciprofloxacin is currently not available as a suspension except through the Special Access Scheme.
- Ceftriaxone is the preferred medication for use in pregnant women and in women who are breastfeeding.
- Rifampicin can be used for children under 12 who cannot be appropriately dosed with ciprofloxacin tablets.

Where compliance may be an issue, use of ciprofloxacin, which requires only a single oral dose, may be advantageous unless otherwise contraindicated.

2 Chemoprophylaxis for meningitis. In: eTG complete [Internet]. Melbourne: Therapeutic Guidelines Limited; 2015 Jul.
3 Potential impact on cartilage development for prebubertal children. However, when given for prophylaxis as a stat dose, the effect is unlikely to be a concern

5.1 Standing order for ciprofloxacin for close contacts of meningococcal disease

TITLE	Standing order for meningococcal contacts - ciprofloxacin
Drug(s)	**ciprofloxacin**
Presentation [1]	Tablets - 250mg, 500mg Ciprofloxacin is currently not available as a suspension except through the Special Access Scheme
Indication [1 2]	▪ Clearance of meningococcal carriage in close contacts of known cases. ▪ Ciprofloxacin is the preferred option for women taking oral contraceptives
Contraindications[1]	▪ Not to be given in pregnancy or during breastfeeding ▪ Allergies to ciprofloxacin or other quinolones / fluoroquinolones
Precautions[1]	▪ Adrenaline (epinephrine) must be available for the registered nurse or midwife to administer if anaphylaxis occurs. ▪ Use with caution in patients with cystic fibrosis, central nervous system disorders, such as severe cerebral arteriosclerosis or epilepsy, renal impairment, and liver damage. ▪ G6PD deficiency - increases risk of haemolytic anaemia. ▪ Potential impact on cartilage development for prepubertal children. However, when given for prophylaxis as a stat dose, the effect is unlikely to be a concern. ▪ Avoid direct sunlight and ensure adequate hydration
Dose[1]	**Adults:** 500mg, **Children younger than five years:** 30mg/kg up to 125mg, **Children five to 12 years:** 250mg
Dose frequency[1]	Single dose
Administration[1]	▪ Oral (with a full glass of water) ▪ If possible, recipients should be observed for 30 minutes post-ingestion.
Drug Interactions[1]	▪ Ciprofloxacin may interact with, omeprazole, thyroxine warfarin, cyclosporin, metoclopramide, NSAIDs, and other medicines. Check with a pharmacist for any clinically relevant interactions in patients taking other medicines. ▪ Patients are advised that ciprofloxacin may enhance the effects of caffeine.
Adverse effects[1]	▪ Common (>1%): rash, itch, nausea, vomiting, diarrhoea, abdominal pain, dyspepsia. ▪ Infrequent (0.1-1%): headache, dizziness, insomnia, depression, restlessness, tremors, arthralgia, arthritis, myalgia, tendonitis, interstitial nephritis, raised liver enzymes. ▪ Rare (<0.1%): blood dyscrasias, peripheral neuropathy, hepatitis, tendon rupture, anaphylaxis, psychotic reactions, severe skin reaction, QT prolongation. See Product Information for full list. ▪ The majority of listed adverse effects are very unlikely as only a single dose is being given.
Documentation	Obtain consent, explain side effects and provide consumer medicine information and patient information sheet

5.2 Standing order for ceftriaxone for close contacts of meningococcal disease

TITLE	Standing order for meningococcal contacts - ceftriaxone
Drug(s)	**ceftriaxone**
Presentation [1]	Powder for injection 250mg, 500mg, 1G per vial
Indication [1 2]	▪ Clearance of meningococcal carriage in close contacts of known cases. ▪ Ceftriaxone is the preferred option during pregnancy.
Contraindications[1]	▪ Not to be given to premature neonates up to corrected age 41 weeks or infants less than 4 weeks old ▪ Known allergy to the cephalosporin class of antibiotics or a major allergy to penicillin (anaphylaxis, angioneurotic oedema, urticaria). ▪ Lignocaine should not be used as a diluent for intramuscular injection in patients who are hypersensitive to lignocaine
Precautions[1]	▪ Adrenaline (epinephrine) must be available for the registered nurse or midwife to administer if anaphylaxis occurs. ▪ Not to be injected intravenously ▪ History of hypersensitivity to cephalosporins, penicllins or other drugs ▪ History of antibiotic-associated pseudomembranous colitis ▪ History of gastrointestinal disease (particularly colitis), severe renal impairment (e.g. dialysis), lignocaine toxicity, chronic hepatic disease, and malnutrition.
Dose[1]	**Adults:** 250mg IM **Children less than 12 years of age**: 125mg IM **Note: Not in children less than four weeks old**
Dose frequency[1]	Single dose
Administration[1]	▪ Deep intramuscular injection in lignocaine solution 1% to reduce pain at the injection site ▪ Dissolve the contents of 500mg vial in 2mL or 1g in 3.5mL of lignocaine 1% solution, administered by deep intragluteal injection. The lignocaine solution must never be administered intravenously. Product is for single use in one patient only. Discard any residue.
Drug Interactions[1]	No drug interactions of particular concern
Adverse effects[1]	▪ Common or infrequent: diarrhoea, nausea, vomiting, pain and inflammation at injection site, rash, headache, dizziness, allergy. ▪ Rare (<0.1%): neurotoxicity (eg confusion, seizures, encephalopathy) particularly with high doses and / or renal impairment, blood dyscrasias, thrombocytopenia, bleeding, renal impairment. ▪ The majority of listed adverse effects are very unlikely as only a single dose is being given. ▪ See Product Information for full list.
Documentation	Obtain consent, explain side effects, and provide consumer medicine information and patient information sheet

Date:	**Public Health Officer Name:**	**Signature:**
Reason for activation: *(Include Index case record number or outbreak response name as applicable)*		

1 The drug information provided is to act as a guide only, for further information reference should be made to the Australian Medicines Handbook and the full manufacturers product info <accessible via CIAP: > If contraindications, precautions or interactions are present refer to MO before administration

2 Chemoprophylaxis for meningitis. In: eTG complete [Internet]. Melbourne: Therapeutic Guidelines Limited; 2015 Jul.

5.3 Standing order for rifampicin for close contacts of meningococcal disease

TITLE	Standing order for meningococcal contacts - rifampicin
Drug(s)	**rifampicin**
Presentation	Capsules - 150mg, 300mg, Tablets - 600mg, Syrup - 100mg/5mL
Indication	Clearance of meningococcal carriage in close contacts of known cases. (Rifampicin is not indicated for the treatment of meningococcal infections.)
Contraindications [1]	Jaundice, history of hypersensitivity to any of the rifamycins, severe liver disease, pregnancy
Precautions[1]	▪ Hepatic disease; malnourishment; concomitant TB and leprosy; concomitant hepatotoxic drugs; sodium metabisulfite allergy for those taking rifampicin syrup; porphyria; diabetes; premature and newborn infants. ▪ Rifampicin stains body fluids such as urine, sweat and tears, an orange, red or brown colour. Soft contact lenses should not be worn until the urine has returned to its normal colour, as they may become stained. ▪ Women taking the oral contraceptive pill should use another form of contraceptive for the cycle during which they are taking rifampicin. ▪ Pregnancy – may cause bleeding problems in newborn. If used in last few weeks of pregnancy, Vitamin K should be given to mother and newborn infant. ▪ Lactation - Rifampicin is excreted in breast milk and infants should not be breastfed by a patient receiving rifampicin.
Dose[2]	**Adults:** 600mg, **Children over 1 month of age:** 10mg/kg, **Children less than 1 month of age:** 5mg/kg **If weights are not able to be obtained, the following dosage is recommended** [3]**:** **Age** / **Recommended dose** / **Equivalent volume of 100mg/5ml oral liquid** 0-2 months / 20mg / 1 mL 3-11 months / 40mg / 2 mL 1-2 years / 100mg / 5 mL 3-4 years / 150mg / 7.5 mL 5-6 years / 200mg / 10 mL **Note: Ciprofloxacin is preferred for children older than 6 years if able to tolerate tablets**
Dose frequency[2]	All dosages are TWICE daily (every 12 hours) for 2 days
Administration[1]	Rifampicin should be taken on an empty stomach at least 30 minutes before or two hours after food.
Drug Interactions[1]	If taking concomitant antacids, rifampicin should be given at least one hour before the ingestion of antacids. Rifampicin interacts with numerous drugs by accelerating their breakdown and reducing their activity. Check pharmacology texts and/or obtain advice from a pharmacist for patients taking other medications. Examples of interacting medicines include but are not limited to oral anticoagulants (e.g. warfarin), anticonvulsants (e.g. phenytoin, phenobarbitone), antiarrhythmics, tamoxifen, antipsychotics (e.g. haloperidol), antifungals (e.g. fluconazole, itraconazole), antiretroviral drugs (e.g. zidovudine, saquinavir, indinavir), beta-blockers, calcium channel blockers (e.g. diltiazem, verapamil), clarithromycin, corticosteroids,

	cyclosporin, systemic hormonal contraceptives, benzodiazepines (e.g. diazepam), doxycycline, fluoroquinolones, sulfonylureas, levothyroxine, opioids, methadone, tacrolimus, tricyclic antidepressants (e.g. amitriptyline, nortriptyline).
Adverse effects[1]	Common (>1%): Gastrointestinal symptoms (e.g. nausea, vomiting, cramps); rash; body fluid, soft contact lens discolouration (red / orange); Rare (<0.1%): hepatitis, See Product information for full list. Rare adverse effects such as hepatitis are very unlikely as the course for prophylaxis is short.

6 POST-EXPOSURE PROPHYLAXIS OF MEASLES

Purpose

This standing order sets out procedures for ordering, supplying or administering normal human immunoglobulin (NHIg) or measles-mumps-rubella vaccine (MMR) for measles post exposure management of susceptible contacts. A person considered '**susceptible'** to measles is someone who cannot provide acceptable presumptive evidence of immunity to measles as described in 'Measles: Control guidelines for NSW Public Health Units'[1]

This standing order authorises a registered nurse, who practices in accordance with requirements set out in section 2, to administer the specified immunoprophylaxis to defined contacts to protect them from developing measles. Defined contacts may include:

- All household members of the case
- All people sleeping overnight in the same room as the case (e.g. in a hospital, boarding school or military barracks)
- All children and adults at family day care, child care, preschool, school or other educational setting who share a classroom with the case
- People who shared a waiting area at the same time as the infectious case (such as patients in a health care facility's waiting room and any people accompanying these patients) and people who were in a waiting area or consulting room previously occupied by an infectious case for up to 30 minutes after the case has departed
- All work colleagues of the case who share the same work area
- Others who attend or work in the same educational institution as the case, and may have spent time in the vicinity of the case, but do not share a classroom (e.g. a high school, college, lecture theatre block)
- Others who may have been present in the general area where the case was known to be (e.g. cinemas, shopping centres, aeroplane flights and restaurants).

1 Measles: Control guidelines for NSW Public Health Units. Available from: http://www.health.nsw.gov.au/Infectious/controlguideline/Pages/measles.aspx

Immunoprophylaxis

Cases of measles are infectious for around four days prior and four days after the onset of rash. NHIg or MMR should be given as soon as practicable to identified contacts. MMR can be administered within 72 hours (three days) of first contact with an infectious case and NHIg can be administered up to 144 hours (6 days) after first contact. NHIg can be ordered from the Australian Red Cross Blood Service using the order form at

http://www.blood.gov.au/system/files/documents/form-nhig-201115-online.pdf.

Determine the appropriate prophylaxis according to the NSW Health Control Guidelines for Measles[1] based on the time since exposure, age and underlying conditions of the contact:

- Immunocompromised — NHIg
- Pregnancy — NHIg
- Babies under 9 months — NHIg
- Babies at 9 months, children and adults — MMR within 72 hours, NHIG 3-6 days

6.1 Standing order for Measles-Mumps-Rubella Vaccine

TITLE	Standing order for Measles IMMUNOPROPHYLAXIS – MMR
Drug(s)	**Measles-Mumps-Rubella Vaccine**
Presentation [1]	Vials of lyophilised vaccine 0.5 mL (contains live attenuated virus) Store vials at two to eight deg. C. (Refrigerate. Do not freeze.). **Maintain cold chain at all times and protect from all light.**
Indication	Active immunisation to prevent measles in susceptible contacts of confirmed cases of measles.
Contraindications[1]	▪ People with impaired immunity, including AIDS or HIV with impaired immunity, high-dose oral corticosteroids, high-dose systemic immunosuppressive treatment or general radiation, lymphoma, leukaemia. ▪ Untreated tuberculosis ▪ Pregnant women ▪ Allergy to MMR or any component of the vaccine
Precautions[1]	▪ Adrenaline (epinephrine) must be available for the registered nurse or midwife to administer if anaphylaxis occurs. ▪ Patients should be observed for a sufficient period (at least 20 minutes) for the occurrence of early onset reactions seen with measles vaccine ▪ Recent administration of blood product containing antibody (such as NHIG) ▪ Vaccination with another live vaccine in the past 4 weeks ▪ Avoid pregnancy for 28 days after MMR vaccination ▪ Children with a history of seizures- may require treatment to reduce fever 5-12 days after vaccination ▪ Do not use after expiry date on label.
Dose[1]	For both adults and children, the dose of MMR is the same. Reconstitute using diluent supplied.
Dose frequency[1]	Single dose - where a second dose is required, the minimum interval between doses is four weeks.
Administration	Subcutaneous injection - Inject the total volume of the single dose vial (about 0.5mL) into skin of the deltoid muscle or the anterolateral thigh.

1The drug information provided is to act as a guide only, for further information reference should be made to the Australian Medicines Handbook and the full manufacturers product info <accessible via CIAP: > If contraindications, precautions or interactions are present refer to MO before administration

[1]	
Drug Interactions[1]	Immunosuppressants. Immunoglobulin products should not be administered within three weeks after MMR.
Adverse effects[1]	▪ Common (>1%): Headache, Fever may occur 5-12 days after vaccination and last 2-3 days. Fever may be high and should be managed with paracetamol. Lymphadenopathy and rash may occur 1-3 weeks after vaccination and are usually transient. Transient injection site reactions. ▪ Infrequent (0.1-1%): febrile seizures, parotid swelling, arthritis and arthralgia (in children) may occur 1-3 weeks after vaccination and are usually transient. ▪ Rare (<0.1%): thrombocytopenia, chronic joint symptoms. It is uncertain whether encephalopathy occurs, however if it is associated it is less frequent than occurs with measles infection, Anaphylaxis following injection of MMR is rare. There is NO association between MMR vaccination and autism,
Documentation	Obtain consent, explain possible adverse effects and provide consumer medicine information for MMR and patient information sheet
Related Documents	NSW Health Measles Factsheet Consumer Medicine Information sheet for MMR Patient Information Sheet for MMR vaccine (section 8.9)

Standing order activation: *(to be completed for each occasion of use)*

Date:	**Public Health Officer Name:**	**Signature:**
Reason for activation: *(Include Index case record number or outbreak response name as applicable)*		

6.2 Standing order for Normal Human Immunoglobulin

TITLE	Standing order for Measles IMMUNOPROHPYLAXIS - Normal Human Immunoglobulin
Drug(s)	**Normal Immunoglobulin - VF**
Presentation [1]	Vials of solution for intramuscular injection, 160 mg/mL: 2 mL, 5 mL 'Normal Immunoglobulin-VF' Store vials at 2 to 8 deg. C. (Refrigerate. Do not freeze). **Maintain cold chain at all times and protect from all light**
Indication	Passive immunisation to prevent measles in susceptible contacts of confirmed cases of measles
Contraindications[1]	▪ Coagulation disorders that would contraindicate intramuscular injections (such as severe thrombocytopenia) ▪ Individuals with isolated immunoglobulin A (IgA) deficiency, unless they have been tested and shown not to have circulating anti-IgA antibodies
Precautions[1]	▪ Seek expert advice prior to administration if live vaccines (e.g. polio, measles, varicella-zoster) have been given within the last 3 weeks. ▪ Must not be injected intravenously ▪ Do not use if the product appears to be turbid by transmitted light or contains any sediment ▪ Do not use after expiry date on label. Must be used immediately after opening the vial and any unused solution discarded ▪ Should be given with caution to patients with a history of prior systemic allergic reactions following the administration of human immunoglobulin preparations. ▪ Consult with obstetrician or GP for pregnant women.
Dose[1] [2]	Immunocompromised 0.5mL/kg - **to max of 15 mL** All others 0.2mL/kg - **to max of 15 mL**
Dose frequency[1]	Single dose
Administration [1]	▪ NHIg should be brought to room temperature before use, and given slowly by deep intramuscular injection in the buttocks, using a large gauge (19 or 20mm) needle. ▪ Where large doses of NHIG are required the dose should be divided in two and injected in each buttock. Hyaluronidase and/or a suitable local anaesthetic may be added to the injection if desired. ▪ NHIg should not be given intravenously. An attempt to draw back on the syringe after IM insertion of the needle should be made in order to ensure that the needle is not in a small vessel.
Drug Interactions[1]	▪ Passively acquired antibody can interfere with the response to live, attenuated virus vaccines. Contact must be informed that they are unable to receive any live vaccines (polio, measles, varicella-zoster) for at least 5 months after IMI NHIg (6 months for immunocompromised patients). ▪ Immunoglobulins should not be administered for at least two weeks after a vaccine is given.
Adverse effects[1]	▪ Common: Local tenderness, erythema and muscle stiffness may occur at the site of injection and may persist for several hours. Mild pyrexia, malaise, drowsiness and urticaria have been reported occasionally after injection. ▪ Rare: Skin lesions, headache, dizziness, nausea, general hypersensitivity reactions and convulsions. Anaphylaxis following injection of NHIG is very rare.
Documentation	Obtain consent, explain side effects and provide consumer medicine information and patient information sheet

7 ADRENALINE (EPINEPHRINE) FOR ANAPHYLAXIS

Purpose

This standing order sets out procedures for administering adrenaline (epinephrine) for the management of anaphylaxis subsequent to the administration of antibiotics or immunoprophylaxis under public health standing orders.

Symptoms and signs of anaphylaxis

Anaphylaxis causes respiratory and / or cardiovascular signs or symptoms AND involves other organ systems such as skin or gastrointestinal tract, with:

- Skin signs, such as the rapid development of urticarial lesions or erythema, angioedema
- Abdominal cramps, diarrhoea and / or vomiting.
- Signs of upper airway obstruction, such as hoarseness and stridor.
- Indications of lower airway obstruction, such as subjective feelings of retrosternal tightness, dyspnoea or wheeze.
- Limpness and pallor, which are signs of severe anaphylaxis in children.
- Profound hypotension in association with tachycardia, and / or other signs of cardiovascular disturbance, such as sinus tachycardia or severe bradycardia, and weak or absent pulses, when severe.
- Alteration in level of consciousness.

Management of anaphylaxis

- If the patient is unconscious, place them on the left side and position to keep the airway clear. If the patient is conscious, place supine in ‘head down and feet up’ position (unless this results in breathing difficulties).
- Give adrenaline (epinephrine) by intramuscular injection (see standing order for dosage) for any signs of anaphylaxis associated with respiratory and / or cardiovascular symptoms or signs. Although adrenaline (epinephrine) is not required for generalised non-anaphylactic reactions (such as skin rash without other signs or symptoms), administration of intramuscular adrenaline (epinephrine) is safe.
- If there is no improvement in the patient’s condition within five minutes, repeat dose of adrenaline (epinephrine) every five minutes until improvement occurs. Make every effort to call for assistance after first dose
- If oxygen is available, administer by facemask at a high flow rate
- Call for professional assistance and call an ambulance. Never leave the patient alone.
- Begin expired air resuscitation for apnoea, check for central pulse. If central pulse not palpable, commence external cardiac massage (ECM).
- All cases should be admitted to hospital for further observation and treatment.

Experienced practitioners may choose to use an oral airway if the appropriate size is available, but its use is not routinely recommended unless the patient is unconscious.

Antihistamines and / or hydrocortisone are not recommended for the emergency management of anaphylaxis.

7.1 Standing order for adrenaline (epinephrine) for management of anaphylaxis

TITLE	Standing order for adrenaline (epinephrine) for anaphylaxis subsequent to the administration of antibiotics or immunoprophylaxis under public health standing orders
Drug(s)	**adrenaline (epinephrine):1000**
Presentation [1]	Solution for injection (clear, colourless) 1 mg/1mL
Indication [1]	The drug of choice in the emergency treatment of acute severe anaphylactic reactions due to insect bites, drugs and other allergens.
Contraindications[1]	Nil relevant
Precautions[1]	▪ Adrenaline (epinephrine) injection contains no antimicrobial agent. It should be used only once and any residue discarded. Adrenaline (epinephrine) injection should not be used if it is coloured. ▪ NOT to be injected intravenously ▪ Use a 1mL syringe to improve the accuracy of measurement when drawing up small doses ▪ Local ischaemic necrosis can occur from repeated injections in one site ▪ Check expiry date of adrenaline (ephinephrine) injection prior to use and on a regular basis.
Dose[1] [2]	**INTRAMUSCULAR ADRENALINE (EPINEPHRINE) DOSAGE** **Adult / child 10 micrograms/kg (equates to 0.01mL/kg adrenaline (epinephrine) 1: 1,000). Maximum single dose is 500 micrograms (0.5mL). Table below gives dosage recommendations according to age.** **Dose using 1:1,000 ampoules containing 1 mg per 1 mL**

Age	Weight (approx)	Adrenaline (epinephrine) 1:1,000
Less than 1yr	5-10 kg	0.05 - 0.1 mL
1-2 yr	10 kg	0.1 mL
2-3 yr	15 kg	0.15 mL
4-6 yr	20 kg	0.2 mL
7-10 yr	30 kg	0.3 mL
10-12 yr	40 kg	0.4 mL
more than 12 yrs and adult	More than 50 kg	0.5 mL

Dose frequency[12]	Make every effort to call for assistance after first dose **Repeat doses every 5 minutes until improvement occurs**
Administration[12]	Intramuscular injection preferably in the mid-anterolateral (upper outer) thigh (do not inject into buttocks).
Drug Interactions[1]	No drug interactions of particular concern
Adverse effects[1]	Fear; anxiety; restlessness; headache; tremor; weakness; dizziness; pallor; palpitation; respiratory difficulty; hypertension; injection site necrosis. See Product Information for full list.
Documentation	Adrenaline (epinephrine) recipients should be referred to hospital for further observation and treatment
Related Documents	Nil

8 ATTACHMENTS

8.1 Procedure checklist for RNs / midwives to administer or supply medications

☐ Arrange the supply of medications from the designated public hospital pharmacy department. The Medical Public Health Officer should advise the Pharmacy of the medicines required, the estimated quantity and patients' details, if known.

☐ Arrange the supply of an anaphylaxis kit (adrenaline (epinephrine) and 1ml syringes) and be familiar with the adrenaline (epinephrine) treatment protocol, found on the back cover of the current edition of "The Australian Immunisation Handbook" [1].

☐ Assess the eligibility for case or contact in accordance with the NSW Health Public Health Control Guidelines[2].

☐ Explain the rationale and purpose of the medication to the case / contact (or parent / guardian).

☐ Check with the case or contact (or parent / guardian) if they:

1. Are pregnant
2. Have any known allergies
3. Are currently taking any interacting medications or
4. Have pre-existing medical condition(s) where the use of a particular medication may be contraindicated or precautions may be required.

☐ Should the case or contact have a contraindication or precaution to the medication, contact the Medical Public Health Officer.

☐ Explain the adverse effects of the recommended medication.

☐ Provide the Patient Information Sheet, the Consumer Medicine Information Sheet(s), and the NSW Health Fact Sheet and advise them to inform their general practitioner of the treatment at the next visit.

☐ For each person, document the following details: name, address, date of birth, sex, phone number; whether the person has any relevant conditions established above; that information has been given. The form provided in the Appendix 8.2 and 8.3 should be used to document these details.

☐ Record whether valid consent has been given.

☐ Supply recommended medication, labelled by the pharmacist for that patient / contact name. If the name was unknown by the pharmacist at the time he/she packaged and labelled the medication, the Registered Nurse / midwife is to hand write the name, drug frequency, dose, duration and date on the label at the time of supply.

☐ The Medical Public Health Officer must be available to provide advice to the registered nurse if there are any concerns or questions.

☐ For each individual, document as appropriate the administration details and the number of doses supplied.

☐ At the completion of any mass vaccination / treatment program, the Medical Public Health Officer must review, and sign and date the records as soon as possible and ideally within 24 hours, to confirm that the program was conducted in accordance with the standing order.

8.4 Tamiflu® (oseltamivir) Patient Information Sheet

Read this sheet together with the Consumer Medicine Information Sheet for Tamiflu®

What Tamiflu® (Oseltamivir) is used for

Tamiflu is a medicine used for the treatment and prevention of influenza (an infection caused by the influenza virus). It has no effect on the common cold or other respiratory virus infections.

Tamiflu belongs to a group of medicines that attack the influenza virus and prevent it from spreading inside your body.

Tamiflu is absorbed to the key sites of influenza infection and treats the cause. Taking Tamiflu can help you feel better faster. You will also be less likely to develop complications of influenza, such as bronchitis, pneumonia and sinusitis.

Do not give Tamiflu to children under the age of one year.

How much to take

Take Tamiflu exactly as has been prescribed.

Instructions for taking Tamiflu

- Tamiflu is available as capsules or syrup
- You have been prescribed ***(Please check the appropriate box)***:
  - ☐ Tamiflu twice a day for five days as **treatment** for influenza.
  - ☐ Tamiflu once a day for 10 days as **prevention** for influenza.
- Tamiflu should be taken with food
- For young children, the dose can be mixed with soft food e.g. yoghurt, honey to disguise the taste of the medicines.
- Tamiflu should be started as soon as possible.

You should <u>not</u> take Tamiflu if you:

- Have had an allergic reaction to Tamiflu
- Are undergoing haemodialysis.

Tell your nurse or doctor if:

- You are pregnant or breast-feeding
- You have any type of kidney disease.

Adverse effects of Tamiflu

Some people feel unwell with nausea and vomiting or stomach ache. Mostly these are mild and transient. Taking Tamiflu with food can reduce these adverse effects.

<u>Tell your doctor if you notice anything else that is making you feel unwell, even if it is not listed above.</u>

Interactions with other medicines

Tamiflu has no significant interactions with other medications

8.5 Relenza® (zanamivir) Patient Information Sheet

Read this sheet together with the Consumer Medicine Information Sheet for Relenza®

What Relenza® (Zanamivir) is used for

Relenza is a medicine used for the treatment and prevention of influenza (an infection caused by the influenza virus). It has no effect on the common cold or other respiratory virus infections.

Relenza belongs to a group of medicines that attack the influenza virus and prevent it from spreading inside your body.

Relenza is delivered directly to the primary site of infection in the lungs. It works by attacking the influenza virus. Using Relenza can help you feel better faster. You will also be less likely to develop complications of influenza, such as bronchitis, pneumonia and sinusitis.

Do not use Relenza in children under the age of five years.

Instructions for taking Relenza

- Relenza comes as a fine powder in small pockets (known as blisters) in a round foil sheet (disk)
- You have been prescribed ***(please check the appropriate box)***:

  ☐ Relenza 2 inhalations (1 blister / inhalation) twice daily for five days – as <u>treatment</u> for influenza

  ☐ Relenza 2 inhalations (1 blister / inhalation) once daily for 10 days – as <u>prevention</u> for influenza
- Relenza requires the use of the Diskhaler to deliver the medicine in the blister directly to the lungs. Use one blister for each inhalation.
- Relenza should be started as soon as possible.

Using the Relenza Diskhaler

The medicine in your Relenza Disk is taken by breathing it in using the Relenza Diskhaler. Follow the instructions for use provided in the box containing the Diskhaler.

You should <u>not</u> use Relenza if you:

- You have had an allergic reaction to zanamivir or lactose.

Tell your nurse or doctor if:

- You are pregnant or breast-feeding
- You have asthma or any other breathing problems.

Adverse effects of Relenza

Most people using Relenza find that it causes no problems. However, very rarely, some people feel unwell with shortness of breath, wheezing, swelling of the face or in the mouth or throat, an itchy raised skin rash, skin that may blister, peeling of the skin, fainting and light headed.

<u>Tell your doctor if you notice anything else that is making you feel unwell, even if it is not listed above.</u>

Interactions with other medicines

Relenza has no significant interactions with other medications.

8.6 Rifampicin Patient Information Sheet

Read this sheet together with a Consumer Medicine Information Sheet for rifampicin

Rifampicin is an antibiotic that can be given to those in close contact with a person who has developed a meningococcal infection. The purpose of this antibiotic is to clear any meningococcal germs being 'carried' in the throats of contacts so that they cannot lead to meningococcal infections in other people.

This ‘clearance’ antibiotic cannot treat someone who is already developing the infection, so you still need to look out for symptoms and signs of meningococcal disease. (See Fact Sheet)

Instructions for taking rifampicin

- Rifampicin is taken twice a day for two days (a total of four doses are needed). It is available as tablets, capsules or syrup.
- Rifampicin should be taken on an empty stomach, either half an hour before eating or two hours after eating.
- Rifampicin should not be taken at the same time as antacids. Take rifampicin at least 1 hour before taking antacids, if antacid therapy is required.

You should not take rifampicin if you:

- Are allergic to rifampicin
- Have severe liver impairment (with jaundice)
- Are alcoholic or
- Are pregnant.

If rifampicin is unsuitable, you will need to take another antibiotic to get rid of the meningococcal germs. The nurse will discuss this with you.

Adverse effects of rifampicin

The most common adverse effects are gastrointestinal symptoms, such as nausea, vomiting, and cramps or rash. Rifampicin can colour body fluids a red / orange colour, so urine, faeces, sweat and tears may become orange-red. People who wear soft contact lens should use glasses while taking rifampicin as rifampicin may permanently stain them.

Other adverse effects are rare and very unlikely as the course of rifampicin is very short.

Tell your doctor if you notice anything else that is making you feel unwell, even if it is not listed above.

Interactions with other medicines

Rifampicin can interact with many drugs. It is important that you inform the nurse or public health officer if you are taking any prescription, over the counter or complementary medicines before you take rifampicin.

Rifampicin can reduce the effectiveness of oral contraceptives. While taking rifampicin, women taking the oral contraceptive pill should continue to take the active pills, omitting any pill-free or sugar pill interval and continuing for at least seven days after the last dose of rifampicin before stopping the active pills for the normal pill free or sugar pill interval. They should talk to their nurse, pharmacist or doctor if they are unsure of what to do. They should also use additional barrier contraception, such as condoms, while taking rifampicin and for four weeks after the last dose of rifampicin.

8.7 Ciprofloxacin Patient Information Sheet

Read this sheet together with the Consumer Medicine Information Sheet for ciprofloxacin

Ciprofloxacin is an antibiotic that can be given to those in close contact with a person who has developed a meningococcal infection. The purpose of this antibiotic is to clear any meningococcal germs being 'carried' in the throat of contacts, so that they cannot lead to the meningococcal infections in other people. This ‘clearance’ antibiotic cannot treat someone who is already developing the infection, so you still need to look out for symptoms and signs of meningococcal disease (see Fact Sheet).

Instructions for taking ciprofloxacin

- The dose of ciprofloxacin is a **single** dose taken in tablet form.
- The tablet should be swallowed whole with a full glass of water.
- Do not take the tablet if you have taken antacid / indigestion medicines or medicines containing iron or mineral supplements within the previous four hours. Wait until four hours have passed.

You should not take ciprofloxacin if you:

- Have had a previous allergic reaction to ciprofloxacin
- Are pregnant or are breast-feeding.

If ciprofloxacin is unsuitable, you will need to take a different antibiotic to get rid of the meningococcal germs. The nurse will discuss this with you.

Adverse effects of ciprofloxacin

Adverse effects are unlikely as only a single dose of ciprofloxacin is being taken. A few people may feel unwell after taking ciprofloxacin with nausea (feeling sick) or vomiting, mild diarrhoea; or dyspepsia (heartburn).

A **very** uncommon adverse effect is a severe allergic reaction. If you develop facial swelling, tightness in the throat, breathing difficulties, severe itching or a rash, you should seek medical attention immediately (ring 000).

Tell your doctor if you notice anything else that is making you feel unwell, even if it is not listed above.

Interactions with other medicines

Ciprofloxacin may interact with some medicines. If you are taking any other medications you should check with your doctor or pharmacist before taking ciprofloxacin. It is quite safe to take ciprofloxacin if you are taking the oral contraceptive pill.

8.8 Ceftriaxone Patient Information Sheet

Read this sheet together with the Consumer Medicine Information Sheet for ceftriaxone

Ceftriaxone is an antibiotic that can be given to those in close contact with a person who has developed a meningococcal infection. The purpose of this antibiotic is to clear any meningococcal germs being 'carried' in the throat of contacts, so that they cannot lead to meningococcal infections in other people.

This ‘clearance’ antibiotic cannot treat someone who is already developing the disease, so you still need to look out for symptoms and signs of meningococcal disease.

Ceftriaxone is given as a single injection into muscle tissue, such as in the thigh or buttock. Ceftriaxone is safe in pregnancy and in breastfeeding women.

You should not have ceftriaxone if you:

- Are allergic to ceftriaxone or other cephalosporin antibiotics or
- Have ever had a severe or immediate allergic reaction to penicillin antibiotics.

Adverse effects of ceftriaxone

Adverse effects are unlikely as only a single dose of ceftriaxone is being given. A few people may feel unwell after receiving ceftriaxone with pain at the injection site; diarrhoea, feeling sick, vomiting; headache or dizziness.

A **very** rare adverse effect is an allergic reaction - if you develop facial swelling, tightness in the throat, breathing difficulties, severe itching or a rash you should seek medical attention immediately (ring 000).

Tell the nurse if you notice anything else that is making you feel unwell, even if it is not listed above

8.9 Information for Measles contacts: Measles Mumps Rubella (MMR) Vaccine

What is MMR Vaccine?

MMR vaccine is given at age 12 months and again at 18 months of age to immunise children against measles, mumps and rubella. MMR vaccine is also given to susceptible people who may have been exposed to cases of measles. MMR vaccine can make the body produce antibodies against measles and will protect against the disease developing if it is given within 72 hours after exposure to the virus.

How safe is it?

MMR is an extremely safe vaccine. Although the MMR vaccine is made using proteins related to egg, it is safe to provide the vaccine even in people with known allergies to eggs. MMR vaccine should not be given to pregnant women, those with previous allergy to MMR vaccine, or people with impaired immunity such HIV patients and those having cancer treatment.

Because autism usually starts to be noticed when a child is one to two years of age, which is when MMR is given, there was a suggestion of a link between MMR and autism. A great number of studies have been carried out and consistently show NO link to autism.

Can I still get measles?

MMR vaccine usually gives good protection against measles. Even so, some people will still get measles, although the illness is likely to be milder than usual. People receiving MMR vaccine should continue to watch for the symptoms of measles, which include **fever**, **cough**, **sore eyes** and a **red, blotchy rash**. If you or your child develops these symptoms, please call your family doctor. Your doctor will be able to advise you about the appropriate steps to take.

Adverse effects of MMR

The most common side effects are tenderness and redness at the site of injection, which may persist for several hours afterwards. Malaise, fever and / or rash may occur 5-12 days after vaccination, lasting 2-3 days. Fever can be managed with paracetamol. Rare side effects include swelling of the lymph glands (lymphadenopathy), swelling of the parotid glands which are salivary glands on the side of the face (parotitis), joint pain (arthralgia) and allergic reactions including rash (urticaria) and swelling of the lips or tongue (angio-oedema). Very rarely, reduced platelets in the blood (thrombocytopenia) and anaphylaxis – a severe allergic reaction – can result. In case this occurs we ask you to wait at the clinic for 15 minutes after your injection.

Tell the nurse if you notice anything else that is making you feel unwell, even if it is not listed above.

8.10 Information for Measles contacts: Normal Human Immunoglobulin

What is normal human immunoglobulin?

Normal human immunoglobulin is an injection that contains antibodies against a number of infections and is given to susceptible people who may have been exposed to cases of measles. If given early enough, it can prevent or reduce the severity of illness in these people.

To be effective, the correct dose of normal immunoglobulin must be given. The dose is calculated according to the person's weight, up to a maximum of 15mL.

How safe is it?

Normal immunoglobulin is prepared from blood donated to the Australian Red Cross Blood Service, and is screened and treated to ensure that it does not contain HIV, hepatitis B or hepatitis C viruses.

Normal immunoglobulin can be given safely to healthy people of all ages, including babies and pregnant women. It should not be given to people who have had a previous allergic reaction to it, or who have disorders of their immune system affecting the production of certain antibodies.

Can I still get measles?

Normal immunoglobulin usually gives good protection for three to four weeks against measles. Even so, some people will still get measles, although the illness is likely to be milder than usual. People receiving the injection should continue to watch for the symptoms of measles, which include **fever**, **cough**, **sore eyes** and a **red, blotchy rash**. If you or your child develops these symptoms, please call your family doctor. Your doctor will be able to advise you about the appropriate steps to take.

Adverse effects of normal human immunoglobulin

The most common side effects are tenderness and muscle stiffness at the site of injection, which may persist for several hours afterwards. Sometimes there may be redness at the injection site or a fever. Rarely, there may be allergic reactions including rash (urticaria) and swelling of the lips or tongue (angio-oedema). Very rarely, anaphylaxis – a severe allergic reaction – can result. In case this occurs we ask you to wait at the clinic for 15 minutes after your injection.

Should I get vaccinated against measles as well?

Normal immunoglobulin can reduce the effectiveness of certain "live virus" vaccines, including measles-mumps-rubella (MMR), if these vaccines are given too soon afterwards. Ideally a person should wait for five months before being immunised with these vaccines. Please speak to your family doctor or immunisation clinic before you or your child are next immunised.

Tell the nurse if you notice anything else that is making you feel unwell, even if it is not listed above.

INFLUENZA – NSW HEALTH INFLUENZA PANDEMIC PLAN (PD2016_016)

PD2016_016 rescinds PD2010_052

PURPOSE

The primary purpose of the NSW Health Influenza Pandemic Plan (the *Plan*) 2016 is to provide guidance to NSW Health staff and agencies on how to effectively prepare for and respond to an influenza pandemic, in order to minimise the adverse health impacts on the NSW population and reduce the burden and disruption to health-related services in NSW.

The *Plan* also aims to contribute to whole-of-government response activity to reduce the adverse social and economic impacts associated with an influenza pandemic in NSW.

The *Plan* is intended to be flexible enough to provide guidance on the response to a large outbreak of any highly transmissible respiratory pathogen with significant morbidity and mortality.

MANDATORY REQUIREMENTS

NSW Health agencies and services must ensure that District level and health facility level pandemic plans align with the planning assumptions, emergency management principles and planned strategic response activities outlined in the *Plan*. A pandemic plan checklist for Local Health Districts (LHDs) and Specialty Health Networks (SHNs) is provided in Appendix 8 of the *Plan*.

IMPLEMENTATION

Preparing for and responding to an influenza pandemic is a whole-of-health responsibility. The *Plan* presents a range of state-level strategic options for NSW Health agencies and services in preparation for and response to an influenza pandemic, but does not provide operational detail.

Appendix 7 of the *Plan* outlines roles and responsibilities for all health-related agencies and services in NSW in preparation for and response to an influenza pandemic. Additional detail on roles and responsibilities for specific key response areas are provided throughout the document.

1 INTRODUCTION

This is the *NSW Health Influenza Pandemic Plan*. The plan provides a framework to aid the New South Wales health sector response to an influenza pandemic and to outbreaks of other respiratory pathogens with pandemic potential. The plan is always ‘active’.

This plan provides a strategic outline of a range of possible NSW Health response activities that will need to be tailored during an influenza pandemic response.

Supporting documents for specific functional or technical areas of the pandemic response are maintained separately by individual NSW Health agencies.

The development of this sub plan has been informed by the following pandemic plans:

- National whole-of-government influenza pandemic plan – *National Action Plan for Human Influenza Pandemic (NAPHIP)*
- National health influenza pandemic plan – *Australian Health Management Plan for Pandemic Influenza (AHMPPI)*
- NSW whole-of-government influenza pandemic plan – *NSW Human Influenza Pandemic Plan (NSW HIPP).*

An influenza pandemic will have a sustained impact over many months and a specific pandemic plan and different organisational arrangements drawing on existing public health systems are required. The aim is to ensure overall management of the health system whilst responding to the pandemic.

This plan will be reviewed:

- On conclusion of an emergency during which this plan was implemented
- On the introduction of any major structural, organisational or legislative changes which affect NSW Health or key stakeholders
- Under direction from the Health Secretary or Chief Health Officer
- Every five years.

Throughout this plan, 'NSW Health' refers to the broader NSW public health system including NSW Ministry of Health (MoH), Local Health Districts (LHDs), Sydney Health Networks (SHNs), and other health agencies such as the Clinical Excellence Commission (CEC), the Agency for Clinical Innovation (ACI), and shared services.

INFLUENZA AND OTHER POTENTIAL PANDEMIC VIRUSES

The influenza virus causes an acute viral disease of the respiratory tract. Influenza is primarily spread person-to-person by inhalation of and/or contact with infectious droplets, produced by infected people when they cough or sneeze.

Typical signs and symptoms of influenza include: fever, cough, myalgia, sore throat, headache, fatigue and chills. Infection may also occur without symptoms. Severe influenza-related complications include viral pneumonia or secondary bacterial pneumonia. Influenza may also cause a deterioration of chronic diseases such as chronic obstructive pulmonary disease or congestive heart failure.

Influenza is generally categorised into three types - A, B, and C – with outbreaks of influenza A and B occurring regularly every year. Seasonal influenza vaccination is an important intervention to reduce morbidity and mortality for groups at risk of severe disease, as listed in the *Australian Immunisation Handbook*.

Influenza viruses are characterised by distinct differences in their surface proteins (antigens). Both influenza A and B strains have a tendency to mutate leading to small changes in these surface proteins (antigenic drift). Novel influenza strains with pandemic potential may emerge when one strain undergoes a large mutation affecting its surface proteins or when different strains mix their genes in an infected host through genetic re-assortment (antigenic shift).

Only novel influenza A viruses have been known to cause pandemics. However other respiratory viruses with pandemic potential might also emerge or re-emerge (such as SARS coronavirus).

The population health impact of an influenza pandemic is determined by how readily it can be transmitted (i.e. transmissibility) and the seriousness of the illness it causes (i.e. clinical severity). The most severe pandemics are associated with a new influenza A virus that is both highly transmissible and causes severe illness, such as the 1918 'Spanish Influenza' pandemic. Pandemic influenza viruses that tend to cause milder illness can still have a major population health impact, as everyone in the community will be susceptible to infection (e.g. the 1957 A(H2N2) pandemic).

For a novel influenza virus to have pandemic potential it must meet three criteria:

- Humans have little or no pre-existing immunity against the virus
- The virus leads to disease in humans
- The virus has the capacity to spread efficiently from person to person.

This plan is designed to be flexible and adaptable enough to also guide the response during a severe influenza season or to another respiratory pathogen with pandemic potential. The key factors determining the specific response measures for a specific pathogen include its mode and ease of spread, whether it is transmissible prior to the onset of symptoms, and the severity of the illness it produces.

More information about pandemic influenza is available from NSW Health (*www.health.nsw.gov.au*) and the Department of Health (*www.health.gov.au*) websites.

KEY ASPECTS OF THE NSW RESPONSE

1.1 Objectives of the response

The key objectives of the pandemic response in NSW are to:

- Minimise transmission, morbidity and mortality of the pandemic virus in the NSW population
- Inform, engage and empower the public and health professionals to assist in the response to the pandemic
- Minimise the burden on the NSW Health system, health support services and partner agencies to respond to the pandemic
- Ensure that all health sectors work in partnership to provide a coordinated and timely response
- Maintain effective functioning across health services to manage other health issues during the pandemic response so as to achieve optimum health outcomes for the NSW population during a sustained influenza pandemic.

These objectives are in accordance with those outlined in the AHMPPI and NSW HIPP.

1.2 Principles guiding the NSW response

The principles guiding the overall pandemic response in NSW are as follows:

- ***Use of existing systems where possible*** – to avoid duplication and to ensure resilience of pandemic arrangements as far as possible (e.g. existing seasonal influenza surveillance systems, emergency department activity coordination).
- ***Flexible approach*** – to be responsive to the range of possible patterns of spread through NSW during a pandemic, and the spectrum of pandemic infections ranging from asymptomatic to severe illness.
- ***Proportionate response*** – to use pandemic response strategies that can be scaled up or down, proportionate to the clinical severity of the pandemic virus and to the needs of the NSW population.
- ***Recognising additional needs of at-risk and vulnerable groups*** – to ensure that additional health support is provided for groups at risk of severe disease, such as Aboriginal people and people with chronic conditions, and which recognises the needs of people from culturally and linguistically diverse backgrounds in NSW.
- ***National coordination*** – to work collaboratively with other jurisdictions to ensure national consistency in pandemic response measures wherever possible and be guided by the Australian Health Management Plan for Pandemic Influenza (AHMPPI).

1.3 Planning assumptions and scenarios

The NSW Health response will need to be flexible for a range of pandemic scenarios dependent on the clinical severity of infection caused by the pandemic virus, as summarised in Table 1.

Key planning considerations for a pandemic response include the following:

- ***Extended response time*** – healthcare services across the state need to be prepared for a marked increase in demand for healthcare services that may last an extended period of time.
- ***Unknown origin*** – a pandemic virus could emerge at any time of the year and anywhere in the world, including Australia. However, the most likely scenario is for a virus to emerge and be identified overseas, and then be imported into Australia by infected travellers over the next few weeks to months.
- ***Border screening ineffective*** – as infected travellers may have no symptoms on their arrival into Australia, border screening of incoming passengers is unlikely to be of benefit in preventing a pandemic influenza strain entering the country.
- ***Rapid community spread*** – a pandemic influenza virus may cause widespread community illness very quickly due to a short incubation period and the lack of existing immunity in the population. Once the pandemic strain enters NSW it is likely to spread to all parts of the state within a few weeks.
- ***Similar at-risk groups*** – it is reasonable to expect that population groups already known to be at increased risk of severe influenza infections will also be at increased risk during the next pandemic. The health needs of at-risk groups (such as pregnant women, people with chronic diseases) and communities with higher numbers of at-risk individuals (such as Aboriginal communities) need to be taken into account in planning for and responding to a pandemic.
- ***Early information critical for responses*** – epidemiological and clinical information about the novel virus – such as how severe the disease is, how readily it is passed from person to person, which people are most impacted (e.g. particular age groups, predisposing co-morbidities) – may be gained from both local and overseas experience. This evidence will, together with health service impact data, help to inform the implementation of health response strategies to minimise the rate of spread and reduce the overall impact of the pandemic.
- ***Multiple pandemic waves possible*** – experience with past pandemics suggests that there may be subsequent waves of infection in the months after the first wave dissipates. The impact of the pandemic virus in subsequent waves will be strongly influenced by the level of acquired immunity in the community and by decisions around influenza vaccination programmes.

Table 1: Planning scenarios for the NSW Health response to a pandemic

Level of clinical severity	Potential population health impacts	Potential health sector response measures/considerations [1]
Low E.g. pandemic virus causing mild illness with impact similar to a severe influenza season	• Majority of cases have illness of mild to moderate severity • At-risk groups may experience severe disease and death	• Early general public communications to inform and provide practical risk reduction measures • Targeted communications to groups at higher risk • Implement hospital surge management strategies to cope with increased demand as the outbreak spreads in the community • Close engagement with the primary care and community pharmacy sectors in response strategies
Medium E.g. pandemic virus causing mild to moderate illness in most but severe illness for different groups across the state	• Clinical presentations for influenza-like illness above what is expected for a severe influenza season • More severe disease and deaths in at-risk groups and young people • Healthcare staff absences may be high	• Social distancing measures may be considered • Early and frequent communications for the community and at-risk groups regarding response strategies • Optimise resources across health services to achieve overall health outcomes for the population • Consider implementing additional surge/demand management actions, such as delaying or reducing non-urgent activities, surge staffing, and alternative models of care • Continuing close engagement with the primary care and community pharmacy sectors in response strategies and consideration of alternative models of care • Diagnostic testing may need to be prioritised to effectively utilise resources • Antiviral and vaccine use focus on at-risk groups • Work with other government stakeholders to control spread
High E.g. pandemic virus causing severe illness across the state	• Clinical presentations for influenza-like illness may be very high in the population • Majority of cases in the community may experience severe illness • Death rates may be high for at-risk groups • Specialist and critical care capacity in hospitals may be challenged • Healthcare staff absences may be high	• Social distancing measures likely • Strong coordination and prioritisation to ensure hospitals maintain essential services • Surge staff strategies and alternate models of care to respond to high staff absences • Laboratory testing targeted to utilise resources effectively • Priority on supporting the health of at-risk groups, including Aboriginal people • Antiviral and vaccine policy may focus on preventing illness and transmission in the population • Potential use of overflow facilities within LHDs to support patient care and management, including residential care facilities and other suitable venues

1 Note that lower level responses also apply in higher level scenarios.

2 GOVERNANCE ARRANGEMENTS

2.1 National governance

National arrangements are detailed in the *AHMPPI* and the *NAPHIP*. Department of Health (DoH) oversees the national pandemic response, collecting and analysing national surveillance data and managing the National Medical Stockpile.

The Australian Health Protection Principal Committee (AHPPC) coordinates inter-jurisdictional health preparedness and the response to the pandemic. The NSW Chief Health Officer represents NSW on AHPPC.

AHPPC is supported by groups such as the Communicable Diseases Network of Australia (CDNA) and the Public Health Laboratory Network (PHLN), both of which have NSW Health representatives.

2.2 NSW whole-of-government governance

The *NSW State Emergency Management Plan* (*EMPLAN)* and the *NSW Human Influenza Pandemic Plan* (sub plan to *EMPLAN*) identify NSW Health as the lead (combat) agency, with decision-making authority, for any human infectious disease emergency.

Unlike other emergencies where NSW Health involvement as a supporting agency is coordinated by the State Health Services Functional Area Coordinator (HSFAC), when NSW Health is the combat agency (i.e. during a pandemic), it is the Incident Controller who leads the response. The Incident Controller is the Health Secretary.

Where a coordinated whole-of-government response is required, the Incident Controller and the State HSFAC will liaise with the State Emergency Operations Controller (SEOCON), under the provisions of *EMPLAN*.

The *Human Influenza Pandemic Plan* enables the formation of a peak strategic and policy decision-making body, of which the Minister for Health, Health Secretary and Chief Health Officer will be key advisors, to coordinate the whole-of-government response to a pandemic.

2.3 NSW Health governance

A pandemic will be managed using existing systems and resources as far as possible. The Health Secretary, as Incident Controller, will have overarching responsibility for Health's response to a pandemic and will establish an incident management team to oversee the response across the Health system.

Core members of the State Pandemic Management Team include:

- Health Secretary (Chair)
- Chief Health Officer/ Deputy Secretary Population and Public Health
- State HSFAC
- Deputy Secretary – System Purchasing and Performance
- Deputy Secretary – Governance Workforce and Corporate
- Deputy Secretary – Strategy and Resources
- Director – Public Affairs, Ministry of Health
- Chief Executive – Agency for Clinical Innovation
- Chief Executive – Clinical Excellence Commission
- Chief Executive – HealthShare NSW
- Chief Executive – NSW Health Pathology
- Chief Executive representation from metropolitan and regional NSW local health districts
- Additional representatives may be invited as required.

Pandemic-specific response groups (e.g. system performance, public health) may be implemented by the State Pandemic Management Team to manage state-wide coordination of their respective portfolio areas. These groups may choose to use an incident management system such as AIIMS as the basis of operational management arrangements. To avoid duplication of advice, requests and activity, it is essential that relevant information is communicated across response groups.

NSW Health Chief Executives remain responsible for the operation of their health services and can draw on the support of the State Pandemic Management Team and local emergency management resources.

Existing emergency management arrangements described in NSW HEALTHPLAN (PD2014_012) are available to support coordination of whole-of-health resources or provision of expertise as needed, however, during a pandemic, the provisions of this plan override those of HEALTHPLAN.

The State HSFAC will assist with coordinating any required reporting to the State Emergency Management Committee (SEMC) and support the Incident Controller as required.

Table 2 below summarises the key NSW Health governance arrangements in NSW during a pandemic.

Table 2: NSW Health governance arrangements during the pandemic

Role	Responsibilities
Health Secretary (Incident Controller)	• Overarching responsibility for pandemic preparation, response and recovery • Chair of the State Pandemic Management Team • Participates in peak NSW whole-of-government pandemic strategic and policy decision-making bodies • Incident Controller responsibilities as per section 7, #706 *EMPLAN*
Chief Health Officer (CHO)	• Liaises with the Minister for Health and the Health Secretary to provide advice and make recommendations regarding response management • NSW representative on the Australian Health Protection Principal Committee • Member of the State Pandemic Management Team • Participates in peak NSW whole-of-government pandemic strategic and policy decision-making bodies
State Health Services Functional Area Coordinator	• Supports the Incident Controller as requested, including liaising with State Emergency Operations Controller (SEOCON) regarding whole of government support • Member of the State Pandemic Management Team
State Pandemic Management Team	• Coordinates strategic management of NSW Health's response to a pandemic • For membership see previous page
LHD/SHN Chief Executives	• Responsible for LHD/SHN preparation for, operational response to and recovery from a pandemic
LHD/SHN Health Service Functional Area Coordinators	• Support LHD Chief Executives with pandemic response activities as requested

3 PANDEMIC STAGES AND KEY RESPONSE STRATEGIES

The framework for pandemic management in NSW is one of *prevention*, *preparedness*, *response* and *recovery* (*PPRR*). This aligns with the response stages outlined in the *AHMPPI* and the NSW response arrangements detailed in this plan.

The *AHMPPI* response stages (summarised in Appendix 5) focus on pandemic preparedness and operational response for the health sector but also guide the whole-of-government response. The AHMPPI pandemic stages are independent of the global pandemic phases as declared by the World Health Organization (WHO).

A detailed summary of the key state-level NSW Health responsibilities at each stage of the pandemic are presented in Appendix 6.

3.1 Prevention

The period prior to the identification of a novel pandemic influenza strain affecting humans is an important time to optimise existing influenza surveillance systems and ensure they are applicable to pandemic responses. This includes laboratory surveillance to identify novel influenza strains with pandemic potential.

NSW Health also collaborates closely with the NSW Department for Primary Industries in its efforts to prevent and control outbreaks of influenza in animals to minimise the risk of transmission to humans.

3.2 Preparedness

During the preparedness stage, potential pandemic pathogens that have emerged would be under close monitoring and surveillance by international and national health agencies to allow a tailored and proportionate response.

Within NSW, pandemic preparedness requires active engagement and communication with a range of stakeholders including:

- Clinical groups in health facilities most affected, including emergency departments, infectious diseases, infection control and critical care
- Peak general practice groups and other primary care and pharmacy groups
- Other government agencies and community groups that may be impacted.

Preparedness of the health system requires development of the workforce, particularly through training in infection control and through participation in exercises testing responses to a range of pandemic scenarios.

Pandemic response capacity relies on, and builds upon, seasonal influenza response measures embedded in the health system. This includes robust infection control practices (such as hand-washing, respiratory etiquette, isolation of cases) and routine influenza vaccination for healthcare workers and at-risk populations. This also includes interventions to optimise emergency department performance at times of peak influenza activity in the community.

3.3 Response

Once a new human virus with pandemic potential has been identified a range of major pandemic response strategies will be considered. Under the AHMPPI, the response stage is delineated into four sub-stages including: *Standby, Initial action, Targeted action and Stand down* reflecting the need to tailor response activities according to the spread and impact of the pandemic virus in Australia.

The transition through pandemic response stages will be guided by emerging data on the clinical severity and transmissibility of the virus and its impact on the population. The decision to transition through the different stages will be taken by the Australian Government in consultation with states and territory jurisdictions. The Health Secretary in consultation with the State Pandemic Management Team will determine the transition through different response stages in NSW.

The *Standby stage* may vary considerably in duration depending on the spread of the pandemic virus once it reaches Australia. It represents a period of time to ensure enhanced arrangements are in place to coordinate the early response to the pandemic in NSW; for example, communications, governance, surveillance and any border activities if appropriate.

During the *Initial action* stage, detailed clinical and epidemiological data are gathered to understand the nature of the virus and its potential impact in NSW.

During the *Targeted action* stage, as the pandemic becomes more widespread and the demand on health care services increases, tailoring response measures will require regular review of data from disease surveillance and from monitoring of health system and workforce impacts. The effectiveness of any interventions implemented will be assessed to help ensure that the best use is made of the resources available to achieve optimum health outcomes for the population.

During the *Stand down* stage, the decreasing impact of the pandemic may not be the same across geographical areas or population groups in NSW. Targeted response measures may still be required for some LHDs with higher activity, as other areas wind down their activities and move into recovery.

3.4 Recovery

The states and territory jurisdictions have primary responsibility for managing the *Recovery* stage. All NSW Health agencies will work together to support health services and community recovery.

Considerations for LHDs/SHNs and other NSW Health agencies during the recovery stage include the need to plan for services and staff to transition back to “normal” levels/duties. This is an important stage to conduct intra- and interagency evaluations and lessons learnt exercises and incorporate these lessons into future plans and strategic policies.

Auditing and replenishing stockpiles of essential medical supplies and equipment is also a key activity during the recovery stage.

4 ROLES AND RESPONSIBILITIES

The MoH, which for the purposes of this plan includes Health Protection NSW (HPNSW), is responsible for state-wide strategic planning and the implementation of key response activities for a pandemic through the State Pandemic Management Team. This will require close collaboration between all NSW Health and partner agencies.

Appendix 7 outlines the specific responsibilities of MoH Divisions and key NSW Health supporting agencies.

LHDs/SHNs are responsible for planning and delivering health services for their populations according to the principles outlined in this plan. An implementation checklist for LHDs/SHNs is provided in Appendix 8 to support the development of a district-level operational plan for a pandemic.

All NSW Health agencies must undertake regular training, exercises and have business continuity plans, policies and guidelines in place for a pandemic. During the response stage, all NSW Health agencies will be required to provide relevant expertise and advice according to their portfolio. It will be important during a pandemic response to seek feedback and disseminate information through key networks.

5 COMMUNICATION

Timely and accurate communication with the public, healthcare workers, government agencies and industry will assist with maintaining a coordinated and controlled response to a pandemic.

The *AHMPPI* contains information on the national coordination and sharing of information and strategies for how this information is communicated to health stakeholders and the public during the pandemic response.

5.1 Communicating with the public

At the national level, the coordination of the content, delivery and timing of communication messages for the public will be crucial for ensuring confidence in our response to the pandemic. The National Health Emergency Media Response Network (NHEMRN) is responsible for developing and disseminating national communication messages and adaptations for specific audiences.

The NHEMRN is made up of all state and territory health department media units, relevant government agencies, national medical colleges, National Aboriginal Community Controlled Health Organisation (NACCHO) and parts of the private sector directly involved in emergency management.

The Australian Government's Department of Foreign Affairs is responsible for issuing travel warnings to Australians during the pandemic.

In NSW the Public Information Functional Area Coordinator (PIFAC), established under *EMPLAN*, coordinates public information messages on behalf of all government agencies during a multi-agency coordinated emergency response. During a pandemic, the Health Communications Controller works closely with the PIFAC.

MoH Public Affairs Unit will coordinate the response to media enquiries, including the development and dissemination of key messages on behalf of NSW Health at the state level. MoH Strategic Relations and Communications Branch will be responsible for the development and dissemination of state-wide resources and healthcare awareness campaigns in collaboration with MoH Population and Public Health Division. MoH Public Affairs Division and Strategic Relations and Communications Branch will support the Health Communications Controller to develop an integrated communication plan, including use of new media, to ensure coordination of all state-level communications during a pandemic.

The Health Communications Controller in close liaison with the PIFAC will coordinate the timing and release of national messages via NHEMRN during a pandemic.

Health content experts (e.g. public health or clinical services) will work with the Health Communications Controller to develop consistent state-wide public information messages delivered by a qualified spokesperson.

A pandemic can result in a large surge of inbound calls from the public to LHDs. LHDs should plan for options that help utilise existing local telecommunications infrastructure to manage demand as far as possible during a pandemic. If the surge of inbound calls to either the LHDs and/or MoH substantially increases, the Public Health Controller may activate contact centre capacity. The PIFAC in liaison with the Health Communications Controller may also activate the state Public Information Centre.

Some culturally and linguistically diverse (CALD) populations will require tailored and clear messages to address specific health concerns. MoH will work with health partner agencies, including the Aboriginal Health and Medical Research Council of NSW, NSW Multicultural Health Communication Service, NSW Refugee Health, community elders and leaders, to develop a consistent state-wide and coordinated approach to developing and disseminating information and resources for CALD groups during the pandemic.

LHDs should coordinate public messages of local relevance (including those specific for CALD populations) with the approval of the Health Communications Controller.

MoH will work with NSW Multicultural Health Communications Service to ensure that the state-wide NSW Health Care Interpreter Service is briefed as early as possible during a pandemic, so that it can respond accordingly to any increased demand for interpreter services.

5.2 Communicating within the NSW health system

During a pandemic, information about changes to specific aspects of the NSW pandemic response such as infection control recommendations, clinical services, and case definitions will need to be quickly and reliably communicated to healthcare workers, including staff working in NSW Health agencies, Aboriginal health services and community healthcare providers such as GPs and community pharmacies.

The State Pandemic Management Team will coordinate dissemination of relevant information to NSW Health agencies via key contacts (such as Chief Executives, Directors of Clinical Operations, LHD HSFACs, Public Health Unit (PHU) Directors or LHD emergency operations centres).

MoH in collaboration with the DoH will disseminate national messages regarding key pandemic response actions (e.g. change in pandemic stage) to general practitioners (GPs) and community pharmacies.

MoH communicates with the primary health care community (e.g. GPs, Aboriginal health services, community pharmacies) both through their peak bodies and existing reference groups and through direct communications, such as GP practice fax alerts. The National Health Services Directory may also be utilised for emailing information as required. MoH will continue to convene meetings with the peak private hospital groups and aged care facility agencies (e.g. Aged and Community Services NSW and ACT) to keep them informed about pandemic influenza planning developments and to encourage them to adopt appropriate pandemic management policies in their facilities.

The Centre for Aboriginal Health (NSW Health) will convene an Aboriginal Medical Services Advisory Group to consult with Aboriginal health services during a pandemic.

LHDs/SHNs are responsible for maintaining and utilising existing networks and channels of communication to notify local service providers, including any private hospitals, of any changes in key pandemic response activity during a pandemic. LHDs/SHNs are responsible for managing communication with their employees. These messages will complement those being released by the NSW and Australian governments but will add tailored local messages as appropriate.

5.3 Communicating with key government agencies and industry

The Health Communications Controller will liaise closely with cross-government agencies.

The PIFAC is responsible for coordinating communications to business and industry across NSW in consultation with the MoH and Health Communications Controller and other relevant agencies. This would ensure agencies or services providing contractual services to the NSW Health system (e.g. waste disposal and cleaning contractors) are adequately informed of any changes to the pandemic response in NSW.

6 MITIGATION OF TRANSMISSION

6.1 Infection control

The overall aim of infection control measures is to reduce exposure to and transmission of a pathogen. The *AHMPPI* outlines several infection control strategies for managing a pandemic virus in healthcare facilities and in the community.

There is good experimental evidence to demonstrate that influenza is transmitted directly through infectious droplets (i.e. from coughing and sneezing) or indirectly through contact with surfaces contaminated by respiratory droplets (e.g. skin, clothing or objects).

The risk of transmission can be greatly decreased by:

- Individual measures (e.g. hand hygiene and respiratory etiquette)
- Appropriate use of standard, contact and droplet infection control precautions
- Appropriate use of PPE (e.g. gloves, gowns, eye protection and respiratory protection, as appropriate)
- Organisational environmental measures, including: signage; triaging and patient management; isolation rooms and/or cohorting of patients; increased environmental cleaning; and staff vaccination when available.

6.2 Healthcare facilities

Many infection control methods are applied on an ongoing basis, as outlined in the NSW Health *Infection Control Policy* (PD2007_036). More stringent methods may be used across the health system during a pandemic, as outlined in *Minimising Transmission of Influenza in Healthcare Facilities guideline* (GL2010_006).

If there is a reasonable risk of airborne transmission, additional airborne precautions may need to be added to existing infection control measures in healthcare facilities.

In the setting of a pandemic with medium to high clinical severity, enhanced infection control (such as additional environmental cleaning) and isolation measures (e.g. visitor screening) may be recommended to protect at-risk inpatients from transmission of pandemic influenza within healthcare facilities. Minimum standards for environmental cleaning in healthcare facilities are outlined in the NSW Health *Environmental cleaning policy* (PD2012_061).

Through ongoing workforce training schemes, LHDs are responsible for ensuring all personnel working within facilities of their district are equipped with adequate infection control skills.

6.3 Community resources

Communication materials (e.g. pamphlets, online factsheets, mass media advertisements, social media campaigns and signage) in community settings can be effective tools for promoting good infection control practices in the community.

Members of the general community will also require information on strategies to minimise their risk of exposure to influenza and to reduce the risk that they will transmit the virus to others in households, schools, workplaces and public spaces. This may include guidance on early treatment to reduce the infective period.

MoH will work with LHDs to ensure this information is distributed to members of the general public through appropriate channels and in a timely fashion (see *Communication section*). Information provided to primary and community health care providers will include recommendations on clinical assessment and management, including infection control, laboratory testing, antiviral treatment and vaccination.

6.4 Social distancing

Social distancing is a community-level intervention to reduce normal physical and social population mixing in order to slow the spread of a pandemic throughout society, as described in the *AHMPPI*. Minimising the number of contacts of an infectious case can help reduce transmission of the pandemic virus. A range of social distancing interventions are discussed in the *AHMPPI* (pgs. 143-152), including school and/or workplace closures, cancellation of mass gatherings and home isolation and quarantine of cases and contacts (see section below).

The decision to implement widespread and significant social distancing measures would be carefully considered by national and state whole-of-government processes. The implementation of social distancing measures in NSW would depend on the timing and stage of the pandemic response, along with the transmissibility and clinical severity of the pandemic virus.

Depending on the extent to which social distancing measures are applied, the effect on workforce absenteeism and the disruption to daily life may be considerable. The compliance with and benefits of social distancing measures are likely to be highest when the disease is clinically severe.

MoH in partnership with the PIFAC will develop and disseminate public messages emphasizing the rationale and importance of following social distancing procedures as appropriate.

6.5 Home isolation and quarantine

During a severe pandemic, symptomatic individuals may be recommended to remain in home or hospital isolation and this may be extended to exposed contacts (i.e. home quarantine). Both methods are important ways of reducing further virus transmission. Voluntary measures are preferred as compliance is generally high when the community is provided with the rationale behind the measures. Public health powers are an option to enforce quarantine or isolation and this may be considered in the context of a pandemic virus associated with severe clinical outcomes.

A key aspect of emergency preparedness is encouraging self, family and community resilience to improve individuals' ability to self-manage in home isolation (for cases) and quarantine (for contacts, if recommended). This may include the promotion and use of community resources such as a plan for a home emergency kit and emergency pantry list.

This guideline also outlines a range of strategies for health agencies on how to collect surveillance data from cases and contacts in home isolation and quarantine. This includes the use of phone calls and/or SMS systems, as well as NCIMS to collect and record epidemiological data.

Support in sourcing alternative accommodation for large numbers of people would be provided by the State Emergency Operations Controller under the arrangements detailed in the *NSW HIPP*. However, this is unlikely to be a useful measure during a pandemic and would only be recommended in extreme circumstances.

It is essential that the health and welfare needs of those in home isolation and quarantine are adequately addressed. Arrangements for accessing support from other NSW agencies are detailed in the *NSW HIPP*.

7 HEALTHCARE DELIVERY - FACILITIES

Hospitals and other healthcare facilities will need to consider a range of service options to enable them to continue to deliver optimal health outcomes to the population, both for pandemic and non-pandemic patients. Communications within and between LHDs to share information on approaches to service delivery will be important in identifying the best service delivery options for each facility.

During the pandemic response, CEs may wish to consider a range of healthcare facility models to assess, manage and treat pandemic patients according to the spread and potential impact of the virus.

- During the *Initial action* stage, when the pandemic virus has only just emerged in NSW, LHDs may wish to consider enhanced ED triage for patients presenting with ILI and/or respiratory complications.
- During the *Targeted action* stage, as the pandemic virus spreads more widely in the community, LHDs may need to consider alternative models of care that preserve the capacity of EDs to respond to other patients with acute care needs either within or outside of the facility.

LHDs/SHNs should liaise with private health and aged care about key response strategies utilised during a pandemic in NSW.

Private hospitals are encouraged to adopt pandemic planning and management policies similar to those outlined in this plan. Private hospitals providing public services should prepare their plan together with the relevant LHD.

LHDs should incorporate EDs, critical care units and PACs into their business continuity planning for responding to a pandemic. These business continuity plans should include consideration of the need for additional resources to support:

- Staffing in critical demand areas
- Infection control, including PPE
- Medical supplies and equipment (e.g. ventilator equipment and medications).

Facility managers in LHDs should review food and linen production and distribution requirements during a pandemic, in consultation with HealthShare NSW in order to support the clinical management of patients within healthcare facilities.

7.1 Clinical management

During a pandemic, demand for acute care is predicted to be very high. Adjustments may need to be made to the routine delivery of hospital services to maximize the benefit of scarce resources in the most effective and ethical way. Principles guiding the management of demand and capacity within healthcare services include:

- That care given to people will be maximised within the available resources
- Plans should be consistent with the aim of preserving and maintaining essential healthcare services
- Changes to service delivery and clinical protocols should reflect changes in local and/or regional demand where appropriate
- Decisions regarding surge capacity and demand management should be coordinated at a strategic level within the health care service to ensure consistency of approach
- That a phased approach be used in scaling back any healthcare services to ensure demand management reflects the pandemic impact at the time
- Coordination by Health system support staff to ensure cross-district consistency of access is maintained.

Prior to the pandemic, LHDs and SHNs should identify all acute services that they provide, how services might be prioritised and plan for alternative mechanisms of service delivery where necessary. This planning work should encompass all local health service providers.

In developing plans for healthcare demand management during a pandemic, LHDs and SHNs should consider inter-related elements of healthcare services, including:

- physical aspects of capacity (e.g. beds, wards and ventilation equipment)
- hospital staff numbers (e.g. of clinical, allied health and administrative staff) and ability for staff to cross over to other areas
- clinical services and protocols (e.g. types of services and models of care).

While governance for service delivery changes within LHDs rests with LHD Chief Executives, state-wide agreement will be sought wherever possible for any major changes to services, such as criteria for admission, triage or discharge, or new clinical management guidelines. This will be with the aim of promoting equitable delivery of healthcare across all districts.

Groups of specialist physicians (e.g. infectious diseases, maternal and newborn care and critical care) will be consulted to provide expert advice on the appropriate clinical management of patient groups.

7.2 Emergency departments (EDs)

EDs are a critical part of the hospital response to a pandemic in NSW. The level of response needed by EDs should be based on data on the epidemiology of the pandemic virus and the capacity of EDs to respond.

Guidance on clinical models of care and the role of ED staff during a pandemic are provided in the Australasian College of Emergency Medicine (ACEM) guidelines on the *Management of severe influenza, pandemic influenza and emerging respiratory illnesses in Australasian Emergency Departments.*

EDs will need to monitor capacity to manage suspect and/or infected patients throughout the pandemic to help inform LHD planning in regards to the establishment or stand down of different models of care. For example, the ACEM guidelines include consideration of advanced screening stations outside EDs, designated ‘flu areas’ within EDs and/or establishment of stand-alone PACs (see below).

7.3 Pandemic assessment centres

Pandemic Assessment Centres (PACs) are stand-alone facilities, separate (physically and operationally) from existing hospital EDs, which are used for triaging and assessing individuals with ILI. PACs provide one option for healthcare facilities to respond to increased patient demand during a pandemic but they may not be the most appropriate option for all facilities, particularly where alternative strategies already exist.

PACs may be activated by LHDs/SHNs at any time. The Health Secretary, in consultation with LHD CEs, may also direct the opening of PACs.

The purpose of PACs is to ensure:

- EDs and GP surgeries are not overwhelmed with suspected influenza cases and can continue, as far as possible, with their routine business
- Hospital-associated transmission of influenza is minimised by ensuring potentially infectious patients visiting the clinic are kept separate from other patients seeking care in the hospital facility
- A standardised method for assessing and managing patients is adopted
- Anti-viral medication is commenced as required.

In the preparation period, each LHD should identify appropriate sites and develop a staffing and resource plan for PACs. As far as possible, staff for PACs should not be drawn from existing ED staff, or from intensive care or specialist units. Consideration should be given to sites suitable for a range of pandemic scenarios, from mild to severe.

MoH provides guidance on the set-up, operation and resourcing of PACs to support LHDs during the pandemic. MoH will provide a standardised PAC patient form to enable appropriate assessment of patients and collection of data to inform the response at the LHD and state level.

To operate PACs efficiently, LHDs/SHNs will need to ensure there is adequate staffing, IT, network and internet access to enable collection and reporting of PAC service data. LHDs should consider how to inform local healthcare providers of PAC locations and operating hours should the need arise. Private hospitals with EDs may also consider having plans for establishing PACs.

7.4 Critical care services

Critical care services may experience a significant increase in demand for personnel, specialised equipment (e.g. ventilators) and beds. Careful and detailed planning is essential for managing demand in intensive care units (ICUs), high-dependency units, paediatric intensive care units (PICUs), neonate intensive care units (NICUs) and medical retrieval services, as these services operate at or near full capacity on a regular basis.

The standard treatment for pandemic patients will mainly consist of antiviral medication (if indicated and available), antibiotics for secondary pneumonia, and supportive care. The use of mechanical ventilation or extracorporeal membrane oxygenation (ECMO) as treatment modalities for individual patients remains a clinical decision.

Communication will be essential between all critical care services in LHDs/SHNs and MoH to help build an epidemiological profile of the novel virus within clinical settings. MoH will engage and obtain strategic advice from the Medical Controller, ACI (including the Critical Care Taskforce), and the Sydney Children's Hospitals Network (SCHN, including the Paediatric Controller) on the prioritisation and delivery of critical care services for adults and children during a pandemic.

Complex ethical and clinical treatment issues can occur during a pandemic, especially when healthcare demand exceeds supply. Strategies for managing capacity and ensuring evidence-based and equitable care for patients requiring intensive care are outlined in NSW Health policy *Influenza Pandemic – providing critical care* (PD2010_028).

LHDs/SHNs may choose to designate other hospital areas (e.g. operating theatres or general wards) as intensive care surge areas. Some children may be able to be treated and managed at adult hospitals.

7.5 Isolation spaces within healthcare facilities

Isolation spaces are an important component of isolating patients with communicable respiratory infections to contain further spread of the infection. If isolation of individuals is not possible, healthcare facilities may determine that isolation by cohort can occur. Purpose-built isolation spaces, as well as alternate facilities, may be used during a pandemic.

Further guidance on isolation and cohorting of patients to control outbreaks is provided in the NHMRC (2010) *Australian Guidelines for the Prevention and Control of Infection in Healthcare* (see B3.2).

7.6 Hospital in the home

Hospital in the home (HITH) services allow a range of clinical conditions to be effectively and safely managed without a person needing to stay in hospital. HITH services are already provided by many LHDs and SHNs and may be used or expanded during a pandemic response so that are sufficient beds available for patients who need to be in hospital for their care.

7.7 Overflow facilities

Overflow facilities are used to accommodate patients when it is impractical to manage them at home or in a hospital. Healthcare facilities, including private hospitals, would be used preferentially. However, schools, warehouses, convention centres, hotels or sports arenas may be alternative sites.

Overflow facilities may be needed during a long-lasting and/or large-scale health emergency. During a pandemic they may serve as facilities to care for the large additional number of patients requiring treatment and management. The care provided in overflow facilities is generally supportive rather than interventional.

Depending on the infrastructure, staff and capacity within LHDs, the care provided in overflow facilities could include:

- Acute care for cohorted patients
- Expanded ambulatory care (low-level care for non-pandemic patients)
- Palliative care (acute and low-level care).

Each LHD should identify initial overflow facility sites, and planning should detail the circumstances where and when overflow facilities would be established and how these facilities would be staffed appropriately. Geographic variability in attack rates may dictate that overflow facilities are not established in all LHDs simultaneously during a pandemic.

In the event of a severe and widespread pandemic in NSW, the Health Secretary may instruct LHD CEs to open overflow facilities to ensure delivery of essential health services.

7.8 Health workforce issues

Pandemics present significant workforce challenges for NSW Health. Different services may experience increased demand for staff at the same time (e.g. clinical, public health, administrative, support and human resources staff). Staff absenteeism during a pandemic has the potential to place significant further strain on the health workforce.

The risk of occupational acquisition of influenza infection by healthcare workers is low, relative to community settings. However, perceived safety at work is a critical determinant of staff willingness to work during pandemic events, particularly for workers responsible for the care of children in the home environment.

7.8.1 Staff management

A number of inter-related workforce issues have been identified as being particularly pertinent during a pandemic, including:

- The levels of personal protection deemed acceptable by healthcare workers
- Infection control and disease control issues directly impacting upon staff availability (such as quarantine of exposed workers)
- The availability of sufficient staff, including recruitment, retention and equitable allocation issues
- The capacity to support staff in preparing for, responding to and recovering from a pandemic.

Absenteeism levels will vary according to the severity, duration and timing of the pandemic. However, health services should prepare contingency human resource plans in the event of high levels of absenteeism. This should include both positions in critical health services and critical administration areas. Plans should be regularly disseminated and additional training may be needed to prepare staff to work under different conditions.

The *Public Health Workforce Surge Guidelines* (GL2014_003) have been developed to assist LHDs in understanding when and how to identify, recruit and utilise surge staff for public health aspects of the pandemic response.

To ensure continuity of government services during a pandemic, the NSW Government has a Memorandum of Understanding with Unions NSW which sets out employment conditions that would apply during the pandemic, including attendance, salary payments and ability to require staff to provide additional support outside their usual job description.

Human resource plans should:

- Advise staff that they may be called upon at short notice to temporarily work different hours, in a different location or in a different way
- Ensure staff are aware that requests for flexibility on their part will be made with regard to appropriate use of their skills and their award conditions (NB: only clinical staff should be assigned clinical roles during the pandemic)
- Determine minimum staffing levels sufficient to safely maintain services
- Identify part-time staff who can work additional hours
- Identify staff who are prepared to defer annual or long service leave
- Identify casual staff who can work additional hours (while at the same time appropriately managing worker fatigue)
- Identify displaced employees or those on ‘return to work’ plans who can be deployed
- Identify staff who have recently left the organisation and who can be temporarily engaged
- Identify staff who can provide non-clinical support and can be redeployed
- Identify agency resources which can be called upon
- Identify a manager/s and support staff to coordinate planning, communication, resource management and the orientation of staff.

Healthcare workers may believe that they are at increased risk of becoming infected themselves and/or transmitting infection to their friends and families. The adequacy of current Employee Assistance Programs and other systems to support the mental health needs of healthcare workers should be carefully considered and augmented if insufficient.

Managers in all NSW Health and affiliated organisations have a duty of care for staff under Work Health and Safety legislation to ensure that the exposure of healthcare workers to influenza is minimised, such as through appropriate infection control measures and use of PPE. Managers must ensure that all work health and safety risks are assessed and documented, in line with obligations under legislation.

Staff immunisation programs are an important risk mitigation strategy. All NSW Health agencies are required under the Policy Directive - *Occupational assessment, screening and vaccination against specified infectious diseases* (PD2011_005) - to ensure that staff in their district are appropriately screened and immunised (which includes offering seasonal influenza vaccination to all staff).

7.8.2 Education and training

The Health Education and Training Institute (HETI) will work in collaboration with MoH and LHDs to develop appropriate state-wide staff training programs relevant for the pandemic response. LHDs are responsible for regular delivery of staff education and training and for ensuring staff meet training requirements for pandemic preparedness and response as appropriate.

Specialised training may be required for the following groups:

- Front-line clinical healthcare staff such as paramedics and those working in EDs, ICUs and respiratory wards (e.g. refresher training in use of PPE)
- The public health workforce
- Laboratory services
- Primary healthcare and acute clinical staff
- Emergency services or other surge staff personnel supporting a pandemic vaccination clinic or overflow facility
- Clinical staff who will be assessing and managing patients in PACs (e.g. training in the use of clinical screening and triaging protocols).

In particular, critical care units including ICUs and High Dependency Units are staffed by personnel with specific medical or nursing intensive care training, many of whom work in more than one hospital, creating particular challenges for workforce surge. LHDs/SHNs must consider where to source additional personnel and provide additional training to ensure staff can work in intensive care (e.g. personnel trained in respiratory medicine or anaesthesia).

8 HEALTHCARE DELIVERY - COMMUNITY

Under *NSW HEALTHPLAN*, NSW Health may request assistance from health supporting agencies during a pandemic; these include residential care facilities, private health facilities, local government councils and primary healthcare networks. In preparation for a pandemic, MoH works with peak bodies, professional associations and other stakeholder groups to determine the most appropriate role for services that deliver healthcare within a community during a pandemic. Services may be asked to focus on maintaining core business or to take on specific pandemic-related roles depending on the severity of the pandemic.

Community healthcare providers may also be asked to participate in the deployment of alternative models of care to respond to clusters of illness in remote communities. The LHD in consultation with community health providers would be responsible for the implementation and operational management of alternative facilities or models of care in the community.

Other community healthcare providers (e.g. drug and alcohol services, dentists, physiotherapists or specialist rooms) should be prepared to implement screening, increase infection control and appropriately manage or defer attendance by people with ILI during a pandemic.

8.1 General practice

MoH works closely with primary care peak bodies in NSW to determine the most appropriate role for general practice during a pandemic. A key challenge for general practice will be the maintenance of routine services for patients when experiencing a potentially significant increase in demand during a pandemic. The Royal Australian College of General Practitioners (RACGP) has released the *Managing pandemic influenza in general practice* guidelines (as well as an implementation toolkit – see Appendix 4) which outline strategies to help GPs maintain business continuity during a pandemic. The RACGP has also developed Infection prevention and control standards for GPs and other community health providers which would be essential in the preparation and response to pandemic influenza.

LHDs/SHNs should work with their primary health networks to plan the local implementation of national and state pandemic response activities and to coordinate care between general practices and LHD facilities. GPs in rural and remote areas may have little support or relief available from other healthcare providers. LHDs/SHNs should consider and develop ways to work with GPs in rural and remote areas, and involve them in local pandemic planning. Additional roles for nursing staff in primary health networks in remote communities during a pandemic response should also be considered.

8.2 Community pharmacies

Community pharmacies may be asked to take on additional tasks or provide surge workforce capacity during a pandemic. Pharmacies are kept informed about pandemic phase changes through engagement between MoH and the NSW Pharmacy Guild and provided with advice to inform their customers about treatment for ILI.

MoH will consult with the NSW Pharmacy Guild and LHDs/SHNs to help identify any additional tasks (e.g. assistance with distribution of oseltamivir suspension and other anti-viral medications) that may be requested from community pharmacies.

8.3 NSW Ambulance and patient transport

It is anticipated that the NSW Ambulance workload will increase during a pandemic. This will require enhanced triaging of all patients to ensure NSW Ambulance is able to maintain core service delivery to emergency cases. NSW Ambulance is also responsible for providing coordination and communication processes across the service during emergency or campaign type operations. This includes close liaison with the NSW Health Non-Emergency Patient Transport (NEPT) Hub for the expected increase in non-emergency patient transports. Specific command and control operational arrangements are detailed in NSW Ambulance operational plans.

The State HSFAC may request support from the State Emergency Operations Controller for moving large numbers of people to alternate accommodation (e.g. relocating people from the airport that have been exposed to the virus during a flight). NSW Ambulance personnel may be best placed to assist with moving smaller groups of people.

HealthShare NSW is responsible for ensuring pandemic readiness for all Greater Metropolitan NEPT services; including business continuity and surge staff planning. Operational interagency liaison will occur between NSW Ambulance and HealthShare NSW and frontline supervisors during a pandemic.

8.4 Mental health services

Mental health services need to continue to provide core services (e.g. inpatient acute care, rehabilitation and emergency psychiatric services) during a pandemic as well as providing extra support services for mental health workers, other healthcare workers and members of the broader community. Mental health NGOs, GPs, peak bodies and consumer and carer organisations will be key stakeholders in planning and preparedness.

Individuals may develop short or long-term mental health concerns as a result of community anxiety, prolonged isolation or other significant changes to daily life experienced during a pandemic. The particular mental health needs of specific populations must also be considered. It will be important to ensure clear, consistent and timely public communication is produced and disseminated to reduce anxiety.

The psychological issues for healthcare workers in a pandemic will be significant, requiring clear, consistent and frequent communication to reduce community anxiety associated with exposure in the workplace. Many patients with mental health concerns are managed by clinicians in primary care. Early communication between the local LHD and GPs will be important to ensure smooth continuity of care.

The NSW Health Mental Health Line will be briefed on the pandemic and will be the main point of contact for those wishing to access or consult with mental health services. MoH may also activate the Mental Health Disaster Help Line if a specific service is required or if there are large numbers of people seeking assistance.

In order to continue to provide core mental health services to patients, alternative delivery mechanisms may be needed, including telephone or internet consultations and/or alternative access points for medication monitoring. Any decision regarding reduction of services would need to be made in consultation with the Mental Health Controller following full consideration of risk factors and the level of support available in the community.

The MoH Mental Health and Drug & Alcohol Office and LHD Mental Health Directors remain actively involved in pandemic planning to ensure mental health services are incorporated into LHD planning (e.g. developing protocols for the treatment of acutely mentally ill patients with pandemic influenza).

8.5 Correctional and detention facilities in NSW

Corrective Services and Juvenile Justice NSW (as part of the Department of Justice NSW) are responsible for the operational management of services and programs to manage adult and juvenile offenders respectively in corrective facilities or in the community in NSW. The Justice Health and Forensic Mental Health Network (JH&FMHN) as a state-wide specialty NSW Health network, maintains guidelines on supporting the health of adult and juvenile offenders during an influenza pandemic in NSW.

Correctional facilities present unique challenges in relation to social distancing and mitigating the impact of a pandemic. A range of strategies including screening prior to transport, isolation and quarantine are implemented by the JH&FMHN in consultation with Corrective Services NSW, Juvenile Justice NSW, the Department of Justice and NSW Police. JH&FMHN health facility centres, while not linked to specific hospitals, may also serve as PACs in consultation with the relevant LHD.

Immigration detention facilities are the responsibility of the Australian Government; however some detention facilities are contractually operated and managed by private providers. In the event of an influenza pandemic affecting detainees within NSW immigration detention facilities, NSW Health would collaborate with the Commonwealth to implement a range of strategies to support the health of detainees, such as case and contact follow-up, management and treatment.

8.6 Schools and children's services

The NSW Department of Education is responsible for early childhood centres, public primary and secondary schools as well as some adult tertiary education centres such as campuses of TAFE NSW.

During a pandemic, early childhood centres and schools may be a focus of social distancing measures (during the *Standby* and/or *Initial action stage*) to reduce the community-level impact of pandemic influenza, as children typically have higher infection rates, shed virus longer than adults and may be less capable of maintaining high levels of infection control (e.g. adequate hand washing).

It is important to note that school closures have only been shown to be moderately effective at reducing transmission rates and the timing and duration of closures would need to be carefully considered (see *AHMPPI*). Therefore a range of measures designed to help reduce social mixing of students in order to reduce transmission of the pandemic virus may be considered by MoH (e.g. cancellation of extra-curricular or after-school activities).

MoH would liaise closely with the NSW Department of Education, the Catholic Education Commission of NSW and the Association of Independent Schools of NSW to ensure the agreed implementation of any social distancing measures in early childhood centres and/or schools was timely, appropriate and communicated to relevant services and families in NSW.

8.7 Residential care facilities

People living in residential care facilities represent a potentially vulnerable population to the pandemic virus due to a variety of factors such as older age, disability, chronic illness and close living arrangements.

Most residential aged care services are the responsibility of the Australian Department of Social Services (DSS). However MoH and LHDs work closely with DSS and non-governmental organisations (e.g. Aged and Community Services NSW and ACT), facility managers and private providers in NSW on a regular basis to help protect the public health of residents through investigation and control of any infectious disease outbreaks.

All residential care facilities in NSW are encouraged to have plans in place for an influenza pandemic. CDNA maintains guidelines on the *Prevention and management of influenza outbreaks in residential care facilities*. Seasonal influenza outbreaks represent an opportunity for residential care facilities to test any plans, revise arrangements with health partners and incorporate any lessons learnt.

During a pandemic, MoH would work closely with the Commonwealth to ensure communications to residential care facilities in NSW regarding response strategies were coordinated in a timely and appropriate manner.

9 AT-RISK GROUPS

The *AHMPPI* acknowledges that some population groups will be at risk of severe morbidity or mortality from a pandemic virus. Depending on the clinical epidemiology of the pandemic virus, at-risk groups may include traditional seasonal influenza at-risk groups as listed in the *Australian Immunisation Handbook* , including infants, older people, people with chronic conditions, pregnant women and Aboriginal people.

Other population groups may also be at increased risk of influenza complications during an influenza pandemic because their health needs may not be met by traditional or mainstream health services, or they may have difficulty accessing health services and emergency resources. This includes some people from culturally and linguistically diverse backgrounds, including refugees, and the homeless.

LHDs need to consider how to identify and support at-risk populations in their district to ensure timely and appropriate information and healthcare is given during a pandemic. This will include appropriate models of care for ensuring that at-risk groups can access anti-viral medication and/or vaccination during a pandemic. Engaging and building relationships with local GPs, multicultural health networks, community and other care providers will be important in preparing to support the health needs of at-risk groups during a pandemic.

9.1 People with chronic diseases

During a pandemic, MoH would work with the ACI, NSW Pharmacy Guild and LHDs/SHNs to ensure people with chronic conditions are adequately supported in the community to manage their conditions. Public messaging may be used to encourage people with chronic conditions to maintain their treatment and seek advice for exacerbations.

The NSW Chronic Disease Management Program (CDMP) is a free service delivered by LHDs which targets NSW adults who have difficulty managing their condition and are at risk of hospitalization. The CDMP model supports care coordination and integration across the primary health care sector. LHDs should work with local GPs and other community providers (e.g. pharmacies) to develop effective business continuity and workforce surge plans that explore the best use of the CDMP and/or alternative models of care that support people with chronic conditions in the community.

9.2 People from culturally and linguistically diverse (CALD) backgrounds

During a pandemic, MoH would leverage off existing relationships with the NSW Multicultural Health Communication Service, NSW Refugee Health Service and the NSW Healthcare Interpreters Service to ensure the health needs of people from CALD backgrounds are supported. These services provide established pathways of communicating with multicultural families, children and young people, older people and people living in rural areas.

Strategies to support culturally appropriate communication with CALD groups during a pandemic are outlined in the *Communications* section of this plan. MoH would also work with the NSW Multicultural Health Communication Service and NSW Refugee Health Service to ensure that other not-for-profit organisations (e.g. Ethnic Community Council) and ethnic medical associations (e.g. Australian Chinese and Vietnamese Medical Associations) are briefed on the key pandemic response strategies over time so that support services could be provided if appropriate. The NSW Community Relations Council can provide links with community leaders in different CALD groups across NSW if appropriate.

LHDs/SHNs should ensure district level pandemic plans incorporate profiling, mobilisation and health services appropriate for CALD groups during a pandemic. Partnership arrangements in the delivery of health services for CALD groups during a pandemic should also be outlined, such as non-governmental organisations, primary health networks and community outreach services.

It will be important to ensure CALD groups are aware of strategies that will help them mitigate any risk of contracting or transmitting pandemic influenza within their community, such as infection control practices and social distancing measures, and how to access locally appropriate health services for prevention or management of pandemic influenza (e.g. PACs and pandemic vaccination clinics). This might include promotion and use of multilingual resources, local interpreter services, bi-lingual GPs and local refugee health services (including paediatric clinics and refugee health nurses where available).

9.3 Other at-risk groups

Depending on the clinical epidemiology of the pandemic virus, other groups including infants, the elderly and pregnant women might also be at increased risk of severe morbidity and mortality.

Strategies to support the health needs of infants and the elderly in regards to outbreaks of pandemic influenza in early childhood centres and residential facilities are outlined in the *Healthcare delivery – community* section of this plan.

10 ABORIGINAL PEOPLE

Aboriginal communities are a particular focus for pandemic planning as they are characterised by having higher numbers of at-risk individuals (i.e. people at higher risk of severe complications from influenza infections) than the general community.

NSW Health also recognises the importance of embedding the needs and interests of Aboriginal people in the development, implementation and evaluation of all NSW Health initiatives, as described in the *Aboriginal Health Statement and Impact Guidelines* (PD2007_082). Consistent with the principle of working in partnerships, adequate and appropriate pandemic planning for Aboriginal communities will only be achieved through effective partnership arrangements.

There are a number of barriers for Aboriginal people to access mainstream health services, such as availability, location, cost and continuity of care. For a range of reasons there may be potential for wide-spread reluctance of Aboriginal people to present to EDs, PACs and other mainstream health services during a pandemic.

LHDs must ensure that appropriate services are available to mitigate the impact of pandemic influenza in Aboriginal communities.

MoH works with the Aboriginal Health & Medical Research Council (AH&MRC) and LHDs to determine the most appropriate service delivery role for Aboriginal health services during a pandemic. Aboriginal Community Controlled Health Services (ACCHS) should be engaged through established partnership arrangements at a district level. Collaborative planning arrangements with non-ACCHS providers of health and health-related services for Aboriginal people should also be developed and implemented.

PHUs and LHD Directors/Managers of Aboriginal Health can facilitate partnerships with ACCHSs for advice on pandemic planning and its cultural appropriateness for Aboriginal people and communities. The MoH Centre for Aboriginal Health is available as another source of advice on Aboriginal health policy and programs at the state level. Due to the strength of kinship and family relationships, LHDs also need to work with Aboriginal health services and community representatives to develop and promote appropriate social distancing methods.

MoH maintains detailed guidance on how these partnership arrangements with ACCHS and Aboriginal communities in NSW should work in regards to planning for and responding to a pandemic.

11 SURVEILLANCE AND MONITORING

CDNA is responsible for determining any national changes in the case definition of the pandemic virus to enable accurate identification of cases and contacts. The Chief Health Officer will advise LHDs, GPs and community pharmacies and other partner agencies of changes to the case definition. LHDs are responsible for informing health facilities as well as private hospitals and Aboriginal health services (in collaboration with the Centre for Aboriginal Health) within their district of changes.

MoH will be primarily responsible for conducting and coordinating surveillance data collection and timely reporting of data to DoH on behalf of NSW Health. DoH will facilitate development of data transfer protocols for this process and will feed back information and analyses to jurisdictions via CDNA and AHPPC. MoH will inform LHDs of any changes to surveillance arrangements as the pandemic progresses.

LHDs are responsible for conducting and coordinating the early and enhanced data collection on cases and contacts during the pandemic. This enhanced data collection is to be undertaken in parallel with the core responsibilities of LHDs during the pandemic, including the appropriate assessment, treatment and management of cases and contacts. Surveillance data will be a key component of health situation reports and reporting through any emergency operation centres established at state and LHD levels.

Surveillance arrangements

During the early response stage (i.e. *Initial action* stage*)*, detailed data on individual confirmed cases and household contacts will be needed to inform the national and state response to the pandemic as described in the AHMPPI.

Intelligence gathering within Australia will be less important if there is high quality surveillance information available characterising the severity and transmissibility of the pandemic strain from the studies carried out overseas prior to the arrival of the pandemic virus into Australia.

As the pandemic progresses and community transmission becomes established (i.e. *Targeted action* stage) it will be less important and less feasible to identify and follow-up each new case and their contacts. Surveillance activities will then focus on monitoring the impact of the pandemic on the community in general and on the health system in particular.

As the pandemic response transitions to the *Stand down* and *Recovery* stages, the new virus may remain circulating in the population and potentially become a new seasonal influenza virus. It will be important to continue to monitor the pandemic virus for a second wave of infection and/or for antiviral resistance using routine surveillance systems.

11.2 Surveillance systems and data

Wherever possible, existing routine surveillance systems will be used during the pandemic. This approach aligns with the *AHMPPI* and the Population Health Surveillance Strategy NSW 2011 to 2020. Routine surveillance for human influenza occurs year-round in NSW but increases during the winter influenza season.

The following systems may be utilised during a pandemic:

- ***Virological surveillance*** – identifying and monitoring virus types and strains over time. Laboratories across NSW notify confirmed cases of influenza to PHUs. In addition, several public and private laboratories contribute a proportion of virological samples sent each year to the World Health Organization Collaborating Centre (WHO CC) for Reference and Research on Influenza (Melbourne) for monitoring antigenic changes in the influenza virus.
- ***Syndromic surveillance*** – monitoring and detecting any increased presentations for ILI in emergency departments or in the community through general practice. Current examples include the Public Health Real-time Emergency Department Surveillance System (PHREDSS) and eGPS, a program to monitor ILI consultations in sentinel GP practices.
- ***Clinical surveillance in hospitals*** – for monitoring hospitalisations or ICU admissions related to severe respiratory disease for adults or children. Current examples include FluCAN (the Influenza Complications Alert Network) and the Australian Paediatric Surveillance Unit.
- ***Case and outbreak notification*** - PHUs receive influenza notifications from laboratories and reports of outbreaks of ILI in institutions such as residential aged care facilities. Notification data are managed with the state-wide Notifiable Conditions Incident Management System (NCIMS).
- ***Mortality surveillance*** - Death registration data from the NSW Registry of Births, Deaths and Marriages are reviewed for deaths attributable to pneumonia and influenza on a weekly basis. Statistical estimates are then produced to predict the number of influenza-related deaths against a baseline estimate of deaths occurring each year.

- ***Initial action stage / First Few 100 surveillance*** – for a limited period at the start of pandemic, LHDs may be required to assist with the national effort to actively follow-up suspected and confirmed cases of pandemic influenza and their household contacts to examine transmissibility of the pandemic virus, the severity of infections and the groups at risk of severe disease. This enhanced data will be managed in NCIMS and shared with the National Notifiable Diseases Surveillance System (NNDSS) under existing arrangements.
- ***Health facility impact monitoring*** – data on the capacity of healthcare services to manage demand (e.g. ED presentations/admissions and bed/ventilation capacity). The Patient Flow Portal currently managed by MoH provides data on bed capacity and patient flow/transfers at the health facility level. Impacts on other areas such as on ED performance, surgical waiting lists, and staff absenteeism will also need to be monitored.
- ***Detailed clinical surveillance in intensive care units*** – for monitoring severity and clinical outcomes of patients admitted to ICU with suspected or confirmed influenza and/or viral pneumonia.
- ***Vaccine distribution and monitoring data*** – if and when a pandemic vaccine becomes available the current vaccine distribution and monitoring system may need to be enhanced to monitor the distribution and uptake of pandemic vaccines.
- ***Adverse event following immunisation (AEFI) surveillance*** – the existing AEFI system will be utilised by DoH and MoH to monitor adverse events associated with any new pandemic vaccine, particularly adverse events that may not have been detected in pre-licensure vaccine trials.

In addition, other surveillance data may need to be collected depending on the severity of the pandemic and the response strategies utilised in NSW, including:

- International border monitoring (if implemented)
- Workforce absenteeism monitoring.

During the pandemic, routine and enhanced data collection may also need to be supported by additional targeted research studies. These studies are likely to be coordinated at a national level. Pandemic research conducted in NSW will be subject to the capacity and interest of different agencies in NSW, including universities, research institutes, LHDs and other Health agencies.

11.3 International border surveillance

The Australian Government is responsible for developing and implementing policies relating to international border control activities. Roles and responsibilities relating to airports are outlined in the *National Pandemic Influenza Airport Border Operations Plan* (FLUBORDERPLAN).

The suite of border measures that the Australian Government may consider during a pandemic are outlined in the *AHMPPI*. The Australian Government has broad quarantine powers supported by legislation, as listed in Appendix 3.

MoH would respond to requests from the Australian Government via AHPPC to provide assistance with international border control and related risk management activities and the implementation of any measures in NSW. MoH would notify LHD Chief Executives of any border assistance required.

MoH routinely works with relevant LHDs to support Biosecurity Officers (Australian Department of Agriculture and Water Resources) with their border health screening work at international points of entry (airports and seaports) as needed, including providing training and assessing referrals.

MoH supports South East Sydney LHD to conduct the Airports and Seaports Human Biosecurity Program with a focus on cruise ships and Sydney International Airport. South East Sydney LHD would likely take a lead role in supporting border agencies at Sydney International Airport if additional border surveillance activities were recommended.

12 LABORATORY

At the national level, PHLN provides expertise and national guidelines for public health labs involved in microbiological testing.

NSW Health Pathology has primary responsibility for maintaining appropriate provision of laboratory services across NSW during a health emergency, including a pandemic. NSW Health Pathology response plans should be referred to for more detail on laboratory roles and responsibilities.

Supporting NSW guidelines for a laboratory response to an emergency may also be developed to help prepare public and private laboratories to respond to a health emergency such as an influenza pandemic.

12.1 Operational aspects of the laboratory response

In order to have an adequate state-wide capacity to detect novel pandemic viruses in humans, certain laboratories have the capability and capacity to develop tests for novel viruses with pandemic potential.

Diagnostic laboratories face a risk of high demand for diagnostic tests throughout the pandemic, and may also have to deal with increased staff absences. Laboratories should regularly review business continuity plans in order to ensure their capability and capacity to respond to a pandemic.

- During the *Initial action* stage of the pandemic (i.e. before the pandemic virus becomes widespread in NSW), the emphasis of laboratory testing will be on early, accurate diagnosis of all cases to identify and determine the spread of the virus across NSW, and to inform case and contact management.
- During the *Targeted action* stage (i.e. as the pandemic becomes more widespread), the pre-test probability of the pandemic virus being the cause of the illness becomes high. Clinicians will need to be advised to restrict testing to cases where the result will directly impact on clinical management.
- Experience from the pandemic in 2009 suggests that there may be particularly high demand on laboratory capacity when there is widespread influenza activity in the community, even following advice to clinicians. Some screening of test requests may be required to prioritise testing.
- During the later stages of a pandemic, testing should focus on cases admitted to hospital, particularly those in at-risk groups, where the outcome affects clinical management of the patient. Testing may also be used to monitor for strain drift and antiviral resistance.

Serological testing using a specific test for the pandemic virus may be useful for retrospective diagnosis, particularly for severely ill patients for whom specimens were not collected or were negative for the virus. Serological studies may be considered to inform a more robust estimate of the prevalence of infection, and assist in formulation of vaccine strategy.

13 ANTIVIRAL MEDICATIONS

Antiviral medication may be administered to cases to reduce the severity and duration of infection and to shorten the period when the patient is infectious. The medication is most effective if taken within 48 hours of symptom onset. Antiviral medications can be used for treatment of cases, and for both pre-exposure and post-exposure prophylaxis.

During a pandemic, antiviral medications, including those held within the National and NSW stockpiles, will be prioritised for treatment.

Widespread use of antiviral medications as prophylaxis (either pre-exposure or post-exposure) is not recommended as this may deplete a critical treatment resource. The limited use of anti-influenza medication as prophylaxis may be recommended by AHPPC for certain priority groups, such as at-risk contacts or healthcare workers treating pandemic influenza patients during a particularly severe pandemic.

MoH in consultation with LHDs, ACI and other clinical care networks will make decisions around prioritisation of antiviral medications for prophylaxis in NSW based on national recommendations.

Access to antiviral medication for young children pre-prepared as a suspension (i.e. in liquid form) is likely to be limited. If required, hospital pharmacies and some community pharmacies in NSW will be able to compound oral antiviral medication suspension. MoH would work with the peak pharmacy bodies and LHDs/SHNs to ensure access and timely distribution of this medication during a pandemic.

Recommendations for the use of antivirals in NSW will depend on the epidemiological and virological characteristics of the virus (e.g. severity, transmissibility, antiviral resistance, and antiviral efficacy), pre-existing immunity in the community, vaccine availability and logistical constraints.

MoH will provide LHDs, community pharmacies and primary health care providers with clear and timely guidance on antiviral medication use (e.g. agreed target groups, indications for use, dosage, precautions, storage, transport and disposal) as early as possible during the pandemic response. Clinicians can search the NSW Health website for more information on these medications if needed.

The *State-wide Standing Order for Supply or Administration of Medication for Public Health Response* policy (PD2013_035) outlines the arrangements for NSW Health registered nurses to administer and/or supply antiviral medication to cases and contacts for the purpose of treatment or prophylaxis in the community, such as at PACs, residential aged care facilities, or schools.

14 VACCINATION

Vaccination against a novel pandemic virus is a key response activity outlined in the AHMPPI. As soon as a pandemic virus is identified, work begins to produce a customised pandemic vaccine. Due to the lead-time required to manufacture a new vaccine, it may take many months after the emergence of a pandemic before there is enough vaccine for the Australian population.

In addition to customised pandemic vaccines, candidate pandemic vaccines may be available from DoH. Candidate vaccine seed strains have been developed for the avian-origin and swine-origin influenza virus sub-types. The effectiveness of these vaccines will depend upon the match between the seed strain and influenza strain causing the pandemic.

The use of candidate vaccines will depend on many factors, including early virological data, timing and spread of infection in Australia, availability of vaccine and predicted impact of the pandemic. It might be decided these vaccines would be prioritised for at-risk groups and/or healthcare workers during the initial action response stage of the pandemic.

The principles of vaccine prioritisation for the states and territory jurisdictions will be discussed collaboratively through the AHPPC. DoH will coordinate distribution of pandemic vaccines to states and territories. MoH will coordinate the distribution of vaccine to nominated vaccine dispensers (e.g. LHDs/SHNs, GPs) in NSW.

The national pandemic vaccine distribution strategy will be influenced by the amount of vaccine available and the stage of the pandemic when it becomes available. If the vaccine only becomes available after the first wave of pandemic has passed then there will be a preference for using existing vaccine delivery systems, particularly involving general practice.

If an initial supply of a pandemic vaccine becomes available during a pandemic and is recommended to be distributed as part of the outbreak response then this likely to be most effectively delivered through LHDs and SHNs.

LHDs /SHNs are responsible for developing strategies to provide pandemic vaccination to the public within their district in the outbreak setting, in addition to their usual staff vaccination programmes.

Provision of both candidate and pandemic-specific vaccines can be via several models coordinated by LHDs/SHNs depending on the severity of the pandemic virus and vaccine supply. MoH maintains guidelines for LHDs/SHNs regarding the establishment and operation of vaccination clinics during a pandemic.

LHDs/SHNs will be asked to plan for two vaccination scenarios according to MoH guidelines: (i) vaccination of priority groups with a candidate or pandemic-specific vaccine, (ii) mass vaccination for the wider LHD population with a pandemic specific vaccine. It will also be important that LHDs/SHNs consider the needs of at-risk groups in their population when planning vaccination clinics according to these scenarios

LHDs/SHNs should collaborate with local health service and community providers to plan for appropriate models of pandemic vaccine delivery that meet the needs of their population in accordance with MoH guidelines. This may include vaccination through general practice clinics, community centres (e.g. schools or sporting clubs) or through Aboriginal Community Controlled Health Services (ACCHS).

LHDs/SHNs will need to plan for appropriate vaccine clinic locations that allow for adequate crowd control, patient flow and space to facilitate patient assessment, vaccination and observation. LHDs/SHNs will also need to consider staffing arrangements to ensure adequate numbers of immunisers are available to participate in vaccination clinics.

Staff at general practices and community health centres – including GPs, practice nurses and nurse practitioners – represent a skilled workforce capable of supporting pandemic vaccine delivery and administration. LHDs/SHNs should work with primary health networks in their district to plan for inclusion of these staff in the delivery of vaccination clinics as appropriate. Community pharmacists registered in NSW to administer influenza vaccines may also be utilised.

A pandemic influenza vaccination campaign may overlap with the annual seasonal influenza campaign. MoH will provide any specific state-wide instructions about coordinating both vaccination campaigns simultaneously.

15 NATIONAL AND STATE MEDICAL STOCKPILES

Medical stockpiles are strategic reserves of medicine and equipment designed to allow rapid access to standardised items that may not be available in a timely manner through routine supply channels due to increased national or international demand.

The Australian Government is responsible for maintaining the National Medical Stockpile (NMS) and for developing related deployment plans for these items to states and territories. The Chief Health Officer is able to request deployments from the NMS. If national demand is significant, requests may need to be prioritised across the states and territory jurisdictions.

MoH maintains the State Medical Stockpile (SMS) of essential supplies, such as PPE and antiviral medications, for NSW and is responsible for developing deployment plans for these items to LHDs.

HealthShare NSW is responsible for routine procurement of goods and services for LHDs in NSW. During a pandemic, warehousing and distribution of health supplies and uptake of essential items will be monitored by HealthShare NSW. When essential items (e.g. PPE) are no longer available through routine procurement channels, MoH will provide advice to LHDs regarding requesting SMS items.

LHDs are responsible for planning local distribution of resources provided to LHD facilities. In some situations, MoH may ask LHDs to help distribute goods to other healthcare facilities within their area.

APPENDIX 1: ACRONYMS AND ABBREVIATIONS

ACI	Agency for Clinical Innovation
AH&MRC	Aboriginal Health & Medical Research Council
AHMPPI	Australian Health Management Plan for Pandemic Influenza
AHPPC	Australian Health Protection Principal Committee
CALD	Culturally and linguistically diverse
CDNA	Communicable Diseases Network Australia
CE	Chief Executive
DoH	Department of Health (Commonwealth)
EDs	Emergency departments
EMPLAN	NSW State Emergency Management Plan
GP	General practice
HEMU	Health Emergency Management Unit
HSFAC	Health Services Functional Area Coordinator
HPNSW	Health Protection NSW
ICU	Intensive care unit
ILI	Influenza-like illness
JH&FMH	Justice Health and Forensic Mental Health
LHD	Local health district
MoH	NSW Ministry of Health
NAPHIP	National Action Plan for Human Influenza Pandemic
NCIMS	Notifiable Conditions Incident Management System
NHEMRN	National Health Emergency Media Response Network
NMS	National Medical Stockpile
PHLN	Public Health Laboratory Network
PHREDSS	Public Health Real-time Emergency Department Surveillance System
PHU	Public health unit
PIFAC	Public Information Functional Area Coordinator
PPE	Personal protective equipment
SERM Act	State Emergency Rescue Management Act
SCHN	Sydney Children's Hospitals Network
SHN	Specialty health network
SMS	State Medical Stockpile
WHO	World Health Organization
WHOCC	WHO Collaborating Centre for Reference and Research on Influenza

APPENDIX 2: GLOSSARY

AIIMS	Australasian Inter-Service Incident Management System provides an emergency management structure that enables seamless integration of activities and resources of amongst and between agencies when applied to an emergency.
Antiviral medications	Antiviral medications decrease the severity and duration of influenza infections, and reduce the risk of illness in exposed individuals.
Combat agency	The agency identified in *EMPLAN* as the agency primarily responsible for controlling the response to a particular emergency (source: *SERM Act*).
Candidate pandemic vaccine	A vaccine based on a strain of influenza virus considered to have pandemic potential. This vaccine may provide partial protection if it develops into a pandemic strain that is easily transmissible between humans (source: *AHMPPI, 2014)*
Customised pandemic vaccine	A customised pandemic vaccine is a vaccine tailored to a specific pandemic virus strain. It cannot be developed until the next pandemic virus emerges (source: *AHMPPI 2014*).
Health services (NSW)	Health services refer to any medical, hospital, ambulance, paramedical, community health or environmental health service or any other service relating to the maintenance or improvement of the health, or restoration to health, of persons or the prevention of disease in or injury to persons in NSW(source: *Health Administration Act, 1982* No 135, pg. 2).

	This definition specifically refers to the administration of NSW Health services (see below).
First Few 100	FF100 is a surveillance protocol developed by the Australian Government for collection of detailed epidemiological and clinical data on the first few hundred confirmed cases (& their household contacts) of pandemic influenza (source: *AHMPPI 2014).*
NCIMS	Notifiable Conditions Incident Management System – routine database for recording and collecting epidemiological data on cases of notifiable diseases in NSW.
NSW Health	The expression "NSW Health" may be used to describe the Ministry and any other body and organisation under the control and direction of the Minister or the Health Secretary. This includes local health districts, pillars, shared services and other affiliated health agencies, such as NSW Ambulance, HealthShare NSW, Health Infrastructure, NSW Health Pathology, eHealth and St Vincent's Health network.
NHEMRN	National Health Emergency Media Response Network – national peak committee (including jurisdictional health department communications teams) responsible for coordinating the development and dissemination of national communications during a pandemic. (source: *AHMPPI, 2014*).
Pandemic	A pandemic is an epidemic on a global scale. Only Type A influenza viruses have been known to cause influenza pandemics (source: *AHMPPI*, 2014).
Pandemic assessment centres (PACs)	PACs (formerly known as *flu clinics*) are specifically planned facilities that will be needed during a pandemic for medical assessment and management of people with suspected pandemic influenza (source: *AHMPPI 2014*).
Post-exposure prophylaxis	A dose/s of a drug (usually antibiotic or antiviral) given immediately after exposure to disease and before onset of illness (source: *AHMPPI,* 2014).
Pre-exposure prophylaxis	A dose/s of a drug (usually antibiotic or antiviral) given before exposure to a disease, to protect the person from being infected (source: *AHMPPI, 2014*).
Quarantine	The limitation of freedom of movement for a period of time of well persons who are likely to have been exposed to the virus to prevent their contact with people who have not been exposed (source: *AHMPPI, 2014*).
Sub plan	A sub plan is an action plan for a specific hazard, critical task or special event. It is prepared when the management arrangements necessary to deal with the effects of the hazard, or critical task or special events differ from the general coordination arrangements set out in the main or supporting plan for the area (source: *NSW EMPLAN*).
Surge capacity	Health service's to expand beyond normal capacity to meet an increased demand for clinical care (source: *UK DH, Managing Demand and Capacity guidance, 2009*)

APPENDIX 3: LEGAL FRAMEWORK

There are several key pieces of legislation supporting the NSW response to a pandemic.

Australian Government legislation

The Quarantine Act 1908

This Act aims to prevent the introduction of specified diseases into Australia and prevent the spread of such diseases within Australia.

The Biosecurity Act 2015

The new Biosecurity Act will commence on 16 June 2016, replacing the Quarantine Act 1908. Just as with the Quarantine Act, the biosecurity legislation will be co-administered by the Ministers responsible for Agriculture and Health.

National Health Security Act 2007

This Act provides for the exchange of public health surveillance information between the Australian Government and the states and territories, and, where relevant, the WHO.

NSW legislation

State Emergency Rescue and Management Act 1989 (as amended)

This Act details the emergency management framework in NSW.

Public Health Act 2010 and Regulation 2012

This Act outlines public health management in NSW, including notifiable diseases and infectious disease emergencies.

Health Administration Act 1982

This Act establishes the Health Administration Corporation and outlines the functions of the NSW Minister of Health and Health Secretary.

Health Records and Information Privacy Act 2002 (as amended)

This Act governs the management of health information in the NSW public and private sectors.

Health Services Act 1997 (as amended)

This Act outlines the structure of the NSW public health system.

Local Government Act 1993 (as amended)

This Act governs the functions (including regulatory functions) of local councils in NSW.

Poisons and Therapeutic Goods Act 1966 (as amended)

This Act lists poisons and drugs of addiction and states that Australian Government therapeutic goods laws apply in NSW.

Poisons and Therapeutic Goods Regulation 2008 (as amended)

This Regulation supports the *Poisons and Therapeutic Goods Act 1966* and authorises the Health Secretary with powers for emergency medication supply.

Protection of the Environment Operations Act 1997 (as amended)

This Act is the key piece of environment protection legislation administered by the Environment Protection Authority and allows the Government to set out explicit protection of the environment policies.

Work Health and Safety Act 2011 (as amended)

This Act aims to protect workers and other persons against harm to their health, safety and welfare through the elimination or minimisation of risks arising from workplace practices.

APPENDIX 4: ASSOCIATED POLICIES AND GUIDELINES

International plans

World Health Organization's Global Influenza Programme

National plans

Australian Health Management Plan for Pandemic Influenza (AHMPPI)

Australian Immunisation Handbook

National Action Plan for Human Influenza Pandemic (NAPHIP)

National Pandemic Influenza Airport Border Operations Plan (FLUBORDERPLAN)

Sector-specific guidance

Australasian College of Emergency Medicine – *Management of Severe Influenza, Pandemic Influenza and Emerging Respiratory Illnesses in Australasian Emergency Departments*

Communicable Diseases Network Australia – *Influenza infection: national guidelines for public health units*

Communicable Diseases Network Australia – *A practical guide to assist in the prevention and management of influenza outbreaks in residential care facilities*

National Health and Medical Research Council (2010) *Australian Guidelines for the Prevention and Control of Infection in Healthcare*

Royal Australian College of General Practitioners – *Managing Pandemic Influenza in General Practice*

Royal Australian College of General Practitioners – *Pandemic flu kit – implementation guide*

Royal Australian College of General Practitioners – *Infection prevention and control standards*

NSW whole of government guidelines and policies

Memorandum of Understanding between NSW Government and Unions NSW in relation to an influenza pandemic

New South Wales State Emergency Management Plan (EMPLAN)

NSW Human Influenza Pandemic Plan

NSW Health guidelines and policies

(Check NSW Health website for most recent versions)

Aboriginal health impact statement and guidelines (PD2007_082)

Child Wellbeing and Child Protection Policies and Procedures for NSW Health (*PD2013_007*)

Emergency Management Arrangements for NSW Health (PD2012_067)

Environmental cleaning policy (PD2012_061)

Infection control policy (PD2007_036) *[or most current version]*

Influenza pandemic – providing critical care (PD2010_028)

Influenza – Minimising transmission of influenza in healthcare facilities: 2010 influenza season (GL2010_006)

Leave matters for the NSW Health service (PD2014_029)

Notification of infectious diseases under the Public Health Act 2010 (IB2013_010)

NSW HEALTHPLAN (PD2014_012)

NSW Hospital in the Home (HITH) guideline (GL2013_006)

Occupational assessment, screening and vaccination against specified infectious diseases (PD2011_005)

Public Health Workforce Surge Guidelines (GL2014_003)

Public Health Emergency Response Preparedness Minimum Standards (PD2013_039)

Public Health Field Response Guidelines (GL2014_001)

State-wide Standing Orders for the Supply or Administration of Medication for Public Health Response (*PD2013_035*)

APPENDIX 5: AUSTRALIAN PANDEMIC RESPONSE STAGES

Stage	Sub-stage	Key national-level response strategies
Preparedness* No novel strain detected (or emerging strain under initial investigation)		• Establish pre-agreed arrangements by developing and maintaining plans; • Research pandemic specific influenza management strategies; • Ensure resources are available and ready for rapid response; and • Monitor the emergence of diseases with pandemic potential, and investigate outbreaks if they occur.
Response	**Standby** Sustained community person to person transmission overseas	• Prepare to commence enhanced arrangements; • Identify and characterise the nature of the disease (commenced in Preparedness); and • Communications measures to raise awareness and confirm governance arrangements.
	Action Cases detected in Australia Sporadic cases and/or outbreaks occurring in the community Widespread person to person transmission in community	Action is divided into two groups of activities: Initial (when information about the disease is scarce) • Prepare and support health system needs; • Manage initial cases; • Identify and characterise the nature of the disease within the Australian context; • Provide information to support best practice health care and to empower the community and responders to manage their own risk of exposure; and • Support effective governance. Targeted (when enough is known about the disease to tailor measures to specific needs.) • Support and maintain quality care; • Ensure a proportionate response; • Communications to engage, empower and build confidence in the community; and • Provide a coordinated and consistent approach.
	Stand down Virus no longer presents a major public health threat	• Support and maintain quality care; • Cease activities that are no longer needed, and transition activities to seasonal or interim arrangements; • Monitor for a second wave of the outbreak; • Monitor for the development of antiviral resistance; • Communications activities to support the return from pandemic to normal business services; and • Evaluate systems and revise plans and procedures.

Source: Australian Health Management Plan for Pandemic Influenza 2014

* The Prevention stage, although not detailed here, represents an ongoing stage of alertness and preparation for the next pandemic. This includes close collaboration between the human and animal health sectors to monitor viruses with pandemic potential and regular exercising of existing response arrangements.

APPENDIX 6: NSW RESPONSE ACTIVITIES BY PANDEMIC STAGE

PREVENTION
• Monitor for emergence of potential pandemic pathogens • Contribute to regional and global influenza surveillance • Contribute to research on pandemic influenza mitigation strategies • Monitor emerging evidence on influenza treatment and influenza outbreak control measures
PREPAREDNESS
• Promote respiratory etiquette and hand hygiene practices to the general public, particularly in relation to annual influenza season messaging • Promote infection prevention and control practices with healthcare workers, and maintain high levels of infection control for usual respiratory pathogens • Develop, test, revise and exercise pandemic plans for the health sector and across government • Ensure the State Medical Stockpile (SMS) is maintained • Support the development and maintenance of a health workforce with skills necessary for rapid deployment during a pandemic • Support NSW Health agencies to develop operational plans • Engage with primary care providers (especially GPs), the community pharmacy sector and other stakeholders • Optimise hospital performance during peak seasonal influenza activity
RESPONSE **Standby -** *Sustained community person-to-person transmission of a novel virus overseas*
• Initiate emergency management arrangements as required • Check stockpiles, pre-deploy essential items and plan use of resources and medical stockpile items (e.g. PPE, antivirals and vaccines, and resources to support their administration) • Enhance surveillance activities that enable early characterisation of disease • Commence communications to mobilise health services, emergency responders and to inform the public about the pandemic and key response strategies • Awareness campaigns developed to reflect the age and cultures of at-risk groups • Consider appropriate telephony surge options for the NSW Health service, including the identification and training of additional communications staff • Review and consider appropriateness of social distancing measures • Ensure laboratory capability/capacity, including specimen collection and transport are ready • Review support arrangements for home isolation of cases and home quarantine of contacts • Prepare primary and secondary care services for anticipated surge in patients (e.g. use of triage protocols, plans for cohorting and using infection control protocols and resources)
RESPONSE **Initial action -** *initial cases detected in Australia. Intelligence about the disease is scarce*
• Provide clinical management and public health guidelines to support health system response • Provide information through the PIC and SEMC to support the whole-of-government response • Contribute to border control measures as appropriate • Support the implementation of the enhanced surveillance arrangements in LHDs for early characterisation of the pandemic virus (e.g. First Few 100 surveillance studies) • Provide antiviral medication for cases (treatment) and/or contacts (prophylaxis) as appropriate • Monitor workforce surge requirements and consider deployments of staff across LHDs and seek inter-jurisdictional support where necessary

- Communicate with the public and healthcare workers to inform them of early response and actions that can help mitigate risk of exposure
- Develop targeted messaging and education for sectors directly affected by pandemic response measures (e.g. schools, public transport)
- Support effective governance arrangements with NSW Health agencies and other sectors/networks
- Support the implementation of candidate vaccine programs in LHDs if appropriate
- Consider implementation of a range of social distancing measures
- Implement appropriate NSW Health telephony surge options
- Isolate early cases and contacts in healthcare settings or in the community
- Implement strategies that support the health of at-risk groups in the community
- Prepare and/or deploy alternative models of care in the LHDs
- Focus laboratory testing resources on early and accurate diagnosis of cases

RESPONSE
Targeted action – *widespread activity in the community. Response measures tailored to specific needs based on available intelligence.*

- Support and maintain quality of care across health services (e.g. implement triaging protocols for EDs and ICUs, re-enforcing infection control measures)
- Provide antiviral medication for cases (treatment) as appropriate
- Support the implementation and management of whole of hospital initiatives, including alternative models of care, where appropriate and feasible
- Support the implementation of vaccination clinics in LHDs as appropriate for pandemic vaccines
- Focus surveillance activity on collecting core data from routine established systems, including health system performance data
- Communicate with the public and healthcare workers to help them understand changes in the pandemic response and actions that will help mitigate risk of exposure
- Implement strategies that continue to support the health of at-risk groups in the community
- Monitor and support health workforce surge requirements to maintain healthcare services
- Continue to promote infection control measures for health care workers and public
- Prioritise influenza diagnostic testing for patients where results will affect clinical management.

RESPONSE
Stand down – *manage the withdrawal of response strategies and transition to inter-pandemic arrangements*

- Consider additional support for maintenance of services in areas disproportionately affected
- Determine whether to cease enhanced activities and health response measures
- Continue to ensure that core data is collected from routine surveillance systems - including monitoring for second wave and/or antiviral resistance
- Ensure communication activities support return to normal business
- Plan evaluation and/or pandemic review exercises where relevant

RECOVERY
Support the return to 'normal business' and recovery activity in the community

- Contribute to community recovery (via State Emergency Recovery Controller if activated)
- Ensure surge and support staff recruited to work during the pandemic response are briefed and supported to return to their normal duties across NSW Health and partner agencies
- Conduct debrief and evaluation activity to inform future plans and policies
- Consider preparations for a subsequent pandemic wave

APPENDIX 7: PANDEMIC ROLES AND RESPONSIBILITIES

Agency or organisation	Responsible for coordinating aspects of pandemic planning and response at the state level, including but not limited to:
Ministry of Health	
Population and Public Health Division and Health Protection NSW	• Coordinating surveillance and monitoring activity, including early enhanced case finding and contact tracing in the *Initial action* stage • Developing and implementing isolation and quarantine guidelines • Developing public health communication resources in collaboration with the Strategic Relations and Communications Branch (SR&CB) • Health service planning for at-risk groups and Aboriginal peoples • Implementing international border measures in consultation with the State Pandemic Management Team and relevant LHDs • Deploying and assisting in the delivery of pandemic vaccine programs • Providing guidance and support to laboratories • Managing stockpile strategy • Managing antiviral and vaccine distribution • Developing policies to support operational management • Developing and running exercises with relevant stakeholders to test and improve operational plans for the pandemic response • Ensuring state-wide coordination of the public health response through the Public Health Controller
System Purchasing and Performance Division	• Monitoring and reporting on the impact of the pandemic on health system performance • Coordinating with LHDs on the management of emergency departments and other pandemic-related services • Coordinating the sharing of key learnings between LHDs and troubleshooting resource sharing and optimal resource allocation • Monitoring the impact of the pandemic on elective surgery • Providing expert advice on patient flow and emergency departments for public hospitals across NSW in conjunction with the ACI
Governance, Workforce and Corporate Division	• Supporting communications with the private healthcare sector (e.g. private hospitals) in collaboration with LHDs and MoH • Providing advice on the supply and administration of pharmaceuticals, and supporting links and communications with the NSW Pharmacy Guild, NSW Therapeutic Advisory Committee and hospital pharmacies • Providing legal advice regarding emergency legislation and the healthcare response • Developing pandemic-related workforce planning strategies and initiatives, including occupational health and safety policies for NSW Health agencies • Liaison with unions and other workforce groups • Managing Ministerial/Parliamentary requirements • Implementing communication strategies and resources to help keep healthcare workers informed about the pandemic • Developing and distributing state-wide health communication resources in collaboration with Population and Public Health Division • Supporting development of public awareness/notice campaigns and resources during the pandemic in collaboration with the Public Affairs Unit

Strategy and Resources Division	• Providing support, where required, for negotiating inter-government or cross-jurisdictional assistance • Assisting in the identification of and supporting liaison with primary health networks and groups • Supporting the following technical areas including preparing guidance, monitoring and communicating with networks and providing spokespeople: paediatrics, family and maternal health, aged care, disability, mental health & drug and alcohol • Supporting close liaison between the Chief Paediatrician/Paediatric Controller, the LHDs and MoH Population and Public Health Division • Supporting the Mental Health Controller
Public Affairs Unit	• Liaising with the Public Information Functional Area Coordinator • Managing the response to all press enquiries • Preparing press releases • Preparing spokespeople for media appearances • Acting as the focal point for liaison with National Health Emergency Media Response Network
NSW Health agencies	
Clinical Excellence Commission	• Providing infection control and patient safety advice and expertise to MoH • Developing state-wide strategies and resources (including training modules to rapidly up-skill staff) to maintain high levels of compliance with infection control and patient safety recommendations • Monitoring of and communicating with relevant networks • Monitoring and responding to potential quality and safety issues
Agency for Clinical Innovation	• Maintaining links with key clinical networks and providing clinical expertise on patient care • Developing targeted communication for specific medical specialities • Serving as primary point of contact with and providing secretariat support to clinical networks, including identifying emerging issues with networks • Maintaining close liaison with the Medical Controller
Health Education and Training Institute	• Coordinating the development of state-wide education and training packages in agreement with LHDs and MoH • Providing advice on the suitability of current online training resources (e.g. infection control) and the options for “just-in-time” training for surge staff prior to the pandemic
Bureau of Health Information	• Redeploying surge staff during a pandemic (e.g. biostatistical and research staff) where possible • Considering additional targeted research studies in NSW
HealthShare NSW	• Ensuring the supply and delivery of food, hotel, linen and cleaning services are maintained during a pandemic for LHDs, including the public hospital system and PACs • Coordinating state-wide procurement of clinical supplies including pharmaceuticals, consumables and equipment • Monitoring and reporting on system usage of items in short supply • Identifying and providing medical and disability equipment support to people in the community during a pandemic (e.g. home oxygen) • Considering appropriate use of the Greater Metropolitan Non-Emergency Patient Transport services to support the pandemic • Supporting the HealthShare NSW Controller

E-Health	• Maintaining strategies and procedures that both minimise state-wide information communication technology (ICT) service failure and allow for effective support for increases in clinical demand for ICT services during a pandemic
Local health districts (LHDs) / specialty health networks (SHNs)[1]	• Preparing and maintaining arrangements for surge staff capacity across all NSW Health employment categories • Operating and/or deploying surveillance systems for pandemic data collection and reporting as appropriate (e.g. FF100 surveillance studies) • Implementing models of care that allow for delivery of antivirals and vaccines • Supporting and maintaining quality of care across health services and implementing infection control measures as appropriate • Ensuring cleaning and waste management services are appropriate for pandemic influenza • Preparing and implementing arrangements with the Aboriginal Community Controlled Health Services and other key partners that provide health support for at-risk groups in the population • Undertaking engagement and seeking agreement with local government councils on possible support roles during a pandemic (e.g. recruitment of staff to support surge strategies and assist with delivering pandemic vaccination clinics) • Coordinating targeted local communication and supporting communication of state-wide messages • Coordinating consistent content of local health facility pandemic plans
NSW Health Pathology	• Communicating with public and private laboratories across the state regarding pandemic response arrangements, including testing capability/capacity, specimen collection and transport, supplies of reagents and consumables and timely reporting of results to clients • Supporting public reference laboratories with resources for surge response • Ensuring reference centres provide support to other laboratories for acquisition of pandemic-specific testing capacity • Considering, in conjunction with Health partners, prioritisation/suspension of non-emergency testing and outsourcing to an alternative provider based on clinical advice and technical and workforce constraints • Liaising with interstate laboratories for local testing close to state borders • Supporting the Pathology Controller and close liaison with the Public Health Controller
NSW Ambulance	• Ensuring pandemic readiness for all ambulance services across NSW (e.g. business continuity and surge staff planning) • Supporting the Ambulance Controller and close liaison between the Public Health and Medical Controllers during a pandemic response • Coordinating aeromedical services during the pandemic • Responsible through the Ambulance Controller for coordination of patient transport as defined in *NSW HEALTHPLAN*

1 For the purposes of this document when referring to LHDs we also include SHNs (i.e. Justice Health and Forensic Mental Health Network and the Sydney Children's Hospitals Network). However, there is recognition that the implementation of some emergency response activities may differ between LHDs and these two health entities due to a focus on providing healthcare for target at-risk groups within specific correctional or hospital settings respectively and with a lack of field deployment.

APPENDIX 8: CHECKLIST FOR LHD/SHN PANDEMIC PLAN

LHD Pandemic Plan				
Item	**Details**	**Completed**	**In Progress**	**Not Started**
Requirements of the plan	Currency - plan last revised (specify date)	…/…/…..	☐	☐
	Hierarchy - notes how the plan inter-relates to other relevant facility and LHD plans	☐	☐	☐
	Consistency – note how the plan relates to the LHD, state and national pandemic plans	☐	☐	☐
	Management by objectives – notes the objectives of the response at the district level	☐	☐	☐
	Roles and responsibilities – notes responsibilities of all stakeholders at the district level	☐	☐	☐
	Stages – outlines response activities at each stage of the pandemic response (i.e. prevention, preparedness, response, recovery)	☐	☐	☐
	Testing or exercises – outlines how and when (frequency) the plan and key response activities would be exercised	☐	☐	☐
Communication	Details networks for local dissemination of MoH information	☐	☐	☐
	Details how LHDs will communicate with private healthcare providers and other health partners in their district	☐	☐	☐
Surveillance and monitoring	Details arrangements for collection of enhanced data & follow up of first few cases and contacts of pandemic	☐	☐	☐
	Details arrangements for collection of key epidemiological and clinical data throughout the pandemic as agreed at the national and state level	☐	☐	☐
Laboratory arrangements	Identifies the process for the urgent transfer of clinical specimens to a reference laboratory	☐	☐	☐
Medical stockpiles	Describes arrangements to order, store and distribute national and/or state medical stockpile items locally within the district	☐	☐	☐
Mitigation of transmission	Includes reference to relevant national or state infection control guidelines, and/or gives specific instructions on how to implement these guidelines locally within the district	☐	☐	☐
	Details how local support will be provided to people in home isolation and quarantine (particularly early in the pandemic)	☐	☐	☐
Antiviral medications	Identifies how antiviral agents will be distributed and administered to patients according to MoH policy	☐	☐	☐
Vaccination	Details how vaccination clinics would be set up and operated with appropriate resources and staff	☐	☐	☐
Clinical management	Includes reference to guidelines or protocols for management of pandemic patients in health care facilities	☐	☐	☐

11. INFECTIOUS DISEASES, IMMUNISATION AND RELATED MATTERS 11.85

Clinical Management (ctd)	Includes reference to guidelines for the isolation / cohorting of large number of pandemic patients	☐	☐	☐
	Describes strategies to manage additional demand for clinical services at both the facility and LHD level	☐	☐	☐
Healthcare delivery-facilities	Includes plans for the screening and triage of pandemic patients through emergency departments	☐	☐	☐
	Includes reference to guidelines for the management of patients in critical care units (adults and children)	☐	☐	☐
	Includes detail on how pandemic and non-pandemic patients would be managed in facilities	☐	☐	☐
	Includes detail on the establishment, staffing, and resources required to operate a PAC	☐	☐	☐
	Considers alternative models of care for rural and remote healthcare providers	☐	☐	☐
Healthcare delivery - community	Plan specifically details the role of GPs, community pharmacies and primary health care networks	☐	☐	☐
	Plan considers how support might be provided to immigration detention facilities or other residential institutions for controlling outbreaks	☐	☐	☐
	Plan considers how support might be provided to local schools or early childhood centres for controlling outbreaks	☐	☐	☐
	Plan considers the role of community health providers in the maintenance of core mental health services	☐	☐	☐
Aboriginal people	Identifies way to engage and partner with Aboriginal Community Controlled Health Services in pandemic planning and response	☐	☐	☐
	Identifies way to provide appropriate models of care for Aboriginal peoples during a pandemic	☐	☐	☐
At-risk groups	Identifies ways to support the health needs of at-risk groups, such as people with chronic diseases and CALD groups during a pandemic.	☐	☐	☐

INFECTION PREVENTION AND CONTROL POLICY IN HEALTHCARE SETTINGS (PD2023_025)

PD2023_025 replaced PD2017_013

POLICY STATEMENT

Effective infection prevention and control is central for reducing the burden of healthcare associated infections and providing a safe working environment within the healthcare settings. All health workers must comply with infection prevention and control requirements to prevent, identify, manage, and control healthcare associated infections.

SUMMARY OF POLICY REQUIREMENTS

This Policy Directive outlines the mandatory infection prevention and control requirements for NSW Health Organisations including inpatient, outpatient, outreach.

All NSW Health Organisations must implement the requirements that are set out in this Policy Directive, including:

- clinical governance oversight of infection prevention and control program
- legal and legislative framework
- requirements for the infection prevention and control program.

Local infection prevention and control documents are to align with the principles outlined in this Policy Directive and are consistent with the principles and practice outlined within the following NSW Health publications:

- Infection Prevention and Control Practice Handbook
- COVID-19 Infection Prevention and Control Manual
- Respiratory Protection Program Manual
- NSW Health Policy Directive Cleaning of the Healthcare Environment (PD2023_018).

The full Infection Prevention and Control in Healthcare Settings policy is available at:

https://www1.health.nsw.gov.au/pds/Pages/doc.aspx?dn=PD2023_025

COMMUNITY SHARPS DISPOSAL BY AREA HEALTH SERVICES (PD2008_004)

PD2008_004 rescinds PD2005_262.

The Policy Directive should be read in conjunction with:
PD2017_013, Infection Prevention and Control Policy
PD2017_026, Clinical and Related Waste Management for Health Services
GL2017_024, Needle and Syringe Program

INTRODUCTION

The purpose of the Policy Directive is to clarify services to be provided at public hospitals for the disposal of used needles, syringes, and other community sharps resulting from the self-management of medical conditions by members of the public. The Policy Directive applies specifically to public hospitals controlled by an Area Health Service. Similar services must be provided at Area Health Service facilities authorised as outlets of the NSW Needle and Syringe Program regardless of whether the person requesting the disposal service is a client of the Needle and Syringe Program.

"Community sharps" are sharps that have been generated by non-clinical activities. This category includes any instruments or medical devices that have sharp points or edges capable of cutting, piercing or penetrating the skin (for example needles, syringes with needles or lancets), that are designed for such a purpose, and that have the potential to cause injury or infection. In practice the items for which disposal is most commonly requested are syringes, insulin pen needles and lancets used by people in the self-management of diabetes and other medical conditions. However, other items of a similar nature are within the scope of the Policy Directive, including syringes used by injecting drug users.

Ambulatory care in a community setting has become increasingly accepted as a preferred management approach for people with chronic disorders. As a consequence, the disposal of sharps generated in the self-management of these conditions has moved from the healthcare facility clinical waste stream into local communities where domestic waste and recycling services are not designed to accept them.

The inappropriate disposal of community sharps can have a significant impact on workplace health and safety in many non-clinical occupations, particularly in local government and the waste and recycling industries. In many areas of NSW the options available for the disposal of community sharps by people with diabetes and other medical conditions requiring self-injection do not meet current principles and practices for infection control.

While the peer reviewed literature indicates that the potential for transmission of a blood borne virus from an injury involving a community sharp is extremely low, sharps injuries also expose the recipient to the emotional trauma associated with the possibility of disease transmission. Media reporting of these incidents can encourage the perception that harm minimisation initiatives like the Needle and Syringe Program are responsible for all adverse events involving community sharps.

NSW Health works with a range of partner organisations to improve the management of community sharps. Initiatives include publication of *Community Sharps Management Guidelines for NSW Councils*, and development of an information and resource website at http://www.communitysharps.org.au A copy of the Guidelines can be downloaded from the website. The Guidelines promote the concept of "shared responsibility" for the safe management and disposal of community sharps by major stakeholders involved in the life cycle of this equipment, including Area Health Services.

ROLE OF AREA HEALTH SERVICES

It has been NSW Health policy since 1 October 2002 that a community sharps disposal service must be provided at all public hospitals and authorised outlets of the Needle and Syringe Program, with the cost to be met from existing Area Health Service budgets. A shared responsibility approach to community sharps management requires that all Area Health Services provide appropriate services to manage the environmental impact of

community sharps, including their ultimate disposal. Many public hospitals have well-established procedures in place to accept community sharps from the public for disposal at no charge. Such a service may represent the only disposal option consistent with current infection control principles and practices available in those locations where the local council has not yet implemented community sharps disposal arrangements.

Area Health Services have discretion to determine the most appropriate and cost-effective service in each case. To minimise the risk of occupational exposure of hospital staff to community sharps during disposal, one preferred model is to provide a secure disposal bin capable of accepting the most commonly used sizes of sharps containers in a readily accessible part of the hospital grounds. This model removes the necessity for hospital staff to handle sharps containers, allows direct and confidential disposal by community members, and enables 24-hour access. It also avoids any inconvenience to members of the public if a designated staff member is not available to assist them with disposal. While there is no regulation or standard in NSW that applies to the design and construction of community sharps bins, *Community Sharps Management Guidelines for NSW Councils* (page 40) provides design criteria for large public place disposal bins to address duty of care and occupational health and safety considerations.

There is no legislative or other requirement in NSW that individuals use a sharps container that conforms to an Australian Standard for the storage, transport or disposal of community sharps. To stipulate the use of such containers for community sharps disposal at public hospitals may act as a significant disincentive to community members to follow safe disposal practice and potentially places other members of the community at risk of injury from inappropriate disposal. A well-designed public hospital disposal service for community sharps that does not require staff involvement in the disposal process will address occupational health and safety risks potentially associated with this practice and will avoid the need to stipulate that only sharps containers that conform to an Australian Standard will be accepted for disposal.

It should be noted that there is no requirement to provide a replacement sharps container to members of the public who choose to use the disposal service.

MINIMUM SERVICE REQUIREMENTS

The minimum requirements for a community sharps disposal service at a public hospital or authorised outlet of the Needle and Syringe Program are as follows:

1. There must be no charge to access the disposal service.
2. There must be reasonable access at public hospitals in regard to the location of the disposal service and times when the service is available. Consideration should be given to ensuring that short-term parking is provided in close proximity to the disposal point at hospitals where traffic is heavy and/or parking facilities are limited.
3. Persons requesting a disposal service must not be required to provide information or documentation of a personal or medical nature.
4. The service must adequately address the occupational health and safety of staff and contractors, and public safety considerations.
5. Persons who are not clients of the Needle and Syringe Program may choose to attend a needle and syringe service, drug and alcohol service or similarly identified facility in order to obtain a disposal service but must not be required to do so.

An Area Health Service is not required to provide a disposal service for commercial generators of clinical waste/sharps waste, or local government authorities, but at its discretion the Area Health Service may agree to do so under such conditions as it considers appropriate.

Once community sharps have been accepted or aggregated at a public hospital or authorised outlet of the Needle and Syringe Program the needles, syringes, lancets and similar equipment are classified as clinical waste and must be managed in accordance with Policy Directive PD2005_132, *Waste Management Guidelines for Health Care Facilities*.

PROMOTION OF SAFE DISPOSAL

To encourage safe disposal behaviour, patients who generate community sharps should be provided with accurate and consistent information on the importance of appropriate disposal and the location of community sharps disposal facilities provided by the Area Health Service. Staff in contact with patients who generate community sharps should ensure that this information is provided at the commencement of treatment or service access, and is reinforced during subsequent contacts. Referral of patients to their local council for information on the location of other community sharps disposal facilities in their area is also appropriate.

To facilitate this process it is recommended that each Area Health Service establish a coordinating committee or working group consisting of representatives from services or programs that have contact with patients or clients who generate community sharps, or have responsibility for workplace safety or public health issues. Stakeholders with an involvement in community sharps management include diabetes educators, renal unit staff, community health nurses, infection control staff, Public Health Units, and the Needle and Syringe Program.

A useful model for this approach is the Safe Disposal Committee established by the HIV and Related Programs Unit at South Eastern Sydney Illawarra Area Health Service. This multi-disciplinary Committee has operated for a number of years and has collaborated with hospital administrators to facilitate the installation of public access community sharps bins at public hospitals. The Committee includes representatives from local councils and stakeholders such as Diabetes Australia-NSW as well as Area Health Service representatives and has been active in promoting the safe disposal of community sharps to Area Health Service staff and local communities.

Further advice on current service models and minimum standards of service provision can be obtained by contacting the Senior Project Officer, Community Sharps, Mr David Baker, by email at david.baker@hnehealth.nsw.gov.au

67(5/08)

COMMUNITY SHARPS MANAGEMENT (GL2017_023)

PURPOSE

The *Community Sharps Management Guidelines* have been developed to help NSW councils assess and manage risks and minimise harm associated with unsafe or inappropriate disposal of community sharps. Councils, Local Health Districts, government and some non-government organisations all have a role in providing an effective disposal infrastructure and in encouraging safe disposal.

These guidelines replace the *Community Sharps Management Guidelines for NSW Councils* (2004).

KEY PRINCIPLES

Sharps which are generated by community members through self-administered healthcare or recreation are called community sharps. This includes needles, syringes, lancets and prickers resulting from self-injection at private residences and self-injection in public places that are not placed in a designated sharps container provided by a business, commercial or community service activity.

Although no single strategy will be appropriate for all local government areas, the following general principles apply to all community sharps disposal services and infrastructure.

Public health - A focus on improving public health for the whole community.

Harm reduction - A focus on management activities that promote better health, social and economic outcomes for both the individual and the community.

Collaboration - Consultation with partners including all levels of government, local health and social services, business groups, waste management contractors, residents and other stakeholders .

301(20/12/17)

Capacity building - Providing appropriate resources and encouraging the community and other stakeholders to maintain sustainable local community sharps management activities.

USE OF THE GUIDELINE

These guidelines promote a shared responsibility model that encourages engagement by NSW councils of a range of stakeholders to coordinate and deliver a local community sharps management program. Potential partners include state government agencies, medical equipment manufacturers, waste and recycling contractors, local businesses, non-government organisations, and local/regional healthcare services.

To download the guidelines please go to
https://www1.health.nsw.gov.au/pds/Pages/doc.aspx?dn=GL2017_023

301(20/12/17)

NSW NEEDLE AND SYRINGE PROGRAM (GL2023_002)

GL2023_002 replaced GL2017_024.

GUIDELINE SUMMARY

The NSW Needle and Syringe Program is an evidence based public health program that aims to reduce the transmission of bloodborne viruses. It provides sterile injecting equipment, peer support and healthcare navigation to people who inject drugs.

KEY PRINCIPLES

The Guideline outlines Needle and Syringe Program approval and authorisation requirements, service models, operation requirements and workforce development opportunities. This Guideline is applicable to all services and agencies delivering the Needle and Syringe Program in NSW.

NSW Health recognises the important public health contribution made by the Needle and Syringe Program. The following supports the aim and objective of the Needle and Syringe Program:

- Distribution of sterile injecting equipment
- Distribution of condoms and lubricants
- Provision and promotion of safe disposal of used injecting equipment
- Development of a peer workforce
- Development and delivery of education and health promotion programs, including peer support programs
- Provision of information and patient referrals to other health and welfare services, including primary health care and psychosocial support
- Provision of take-home naloxone and other overdose prevention strategies
- Vaccinations
- Hepatitis C (HCV), Hepatitis B (HBV) and Human Immunodeficiency Virus (HIV) testing
- Contribution to blood borne virus and other research and evaluation activities
- Provision of brief interventions

These activities aim to address barriers to accessing sterile injecting equipment, increase health education and reduce the experiences of stigma and discrimination faced by people who inject drugs.

The NSW Needle and Syringe Program guidelines are available at:
https://www1.health.nsw.gov.au/pds/Pages/doc.aspx?dn=GL2023_002

345(18/01/23)

MANAGEMENT OF PEOPLE WITH HIV WHO RISK INFECTING OTHERS
(PD2019_004)

PD2019_004 rescinds PD2009_023

PURPOSE

This Policy Directive sets out roles, responsibilities and communication pathways for service providers that manage people with HIV who risk infecting others. It provides a management framework that recognises education, support and access to HIV antiretroviral treatment as effective and sustainable responses. The policy also gives directions on how to escalate responses when required.

MANDATORY REQUIREMENTS

- Management of HIV transmission risk behaviours must be consistent with the NSW *Public Health Act 2010*, *NSW Public Health Regulation 2012,* and *Public Health Amendment (Review) Act 2017.*
- Where a person presents with behaviours that risk HIV transmission, professionals and health entities must deliver services consistent with the roles and responsibilities set out in section 2 and the management framework in section 4 of this policy.
- Referrals to Police must be directed through the Ministry of Health on advice from the Panel for management of people with HIV who risk infecting others (the Panel) or the Panel Chair (section 6).
- Communication with other jurisdictions on public health matters about a person with HIV must be via the Chief Health Officer (CHO).

IMPLEMENTATION

Clinicians are responsible for:

Diagnosing clinicians are responsible for ensuring that their patients with HIV have access to the NSW HIV support program and five key support services, including:

- Treatment
- Psychosocial support
- Counselling on prevention of infection to others
- Support for partner notification
- Linkage to services including specialist and community services.

Local Health Districts (LHDs) are responsible for:

- Assigning a point of contact for people under management level 1 or above who can coordinate appropriate services and resources available within the LHD
- Implementing an effective work health and safety management system for staff that seek out a client in the community in unknown environments. This must be in line with the policy directives on Work Health and Safety: Better Practice Procedures and Preventing and Managing Violence in the NSW Health Workplace – A Zero Tolerance Approach.

The LHD point of contact is responsible for:

- Identifying a clinical case coordinator where complex issues present
- Seeking advice from the Panel Chair and where the Panel's advice is sought:
    - submitting reports as requested
    - ensuring that an appropriate LHD representative is available to present on the case at Panel meetings
    - implementing the Panel's recommendations.
- Monitoring and ensuring the person's ongoing engagement in care (including referral to other LHDs and coordination of referral to other jurisdiction when required)
- Implementing public health orders
- Acting as the point of contact for the Panel and the Ministry staff.

CPH, NSW Ministry of Health and Health Protection NSW are responsible for:

- Providing secretariat support to the Panel and coordinating communication between the Panel and the CHO. The Panel secretariat is responsible for:
    - seeking reports from the clinician or other service provider responsible prior to the Panel meetings
    - providing Panel meeting minutes to the CHO
    - communicating all recommendations to the LHD and preparing and sending a letter from the CHO to the LHD Chief Executive (CE) in a timely way.
- Referring HIV transmission risk issues brought by the LHD to the attention of the Ministry to the Chair and ensuring formal feedback is provided to the LHD in a timely and supportive way
- Obtaining and communicating advice from Legal and Legislative Services Branch as required
- Collaborating and partnering with HIV organisations, state-wide services and government departments to activate State-wide resources to ensure transmission risk behaviours of a person with HIV are minimised
- Managing notifications of patients with HIV infection and referrals to the HSP.

The Panel is responsible for:
Providing expert advice (through collaboration with LHDs) to clinicians, LHDs and the CHO on strategies to minimise transmission risks.

Panel Chair is responsible for:

- Providing advice and other responses to queries raised on public health risk concerns
- Referring cases to the full Panel where additional advice is needed
- Raising urgent or complex cases about alleged risks with the CHO via the Director, Population Health Strategy & Performance, CPH or their delegate.

Management of people with HIV who risk infecting others – Procedures

1 BACKGROUND

This Policy Directive provides a health system framework for managing people with HIV who risk infecting others.

Under the NSW *Public Health Act 2010*, people with a sexually transmissible infection (STI) (including HIV) are required to take reasonable precautions against transmitting their infection to others. Reasonable precautions against the spread of HIV through sexual activities are:

- Having a suppressed HIV viral load (less than 200 copies/mL), usually resulting from being on antiretroviral therapy (ART) ; or
- Using a condom; or
- Seeking and receiving confirmation from a sexual partner that they are taking HIV pre-exposure prophylaxis (PrEP).

ART is readily available to people with HIV in NSW.

HIV can also be transmitted by sharing drug injecting equipment (contaminated needles, syringes and other injecting equipment, and drug solutions). HIV transmission among injecting drug users can be prevented by never sharing injecting equipment. Though rare in NSW, HIV can also be transmitted from women with HIV to their unborn infants during pregnancy.

There are occasions where a person aware of their HIV infection fails to take precautions against transmitting HIV to others. Reasons for this vary, but generally include contributing factors like substance use and/or misuse, mental health issues, intellectual/cognitive impairment, and psychosocial vulnerabilities (like homelessness and/or social isolation).

In most cases, Local Health Districts (LHDs) can address these contributing factors through holistic and multidisciplinary case management. Case management can include providing access to counselling, education, housing providers, and disability pensions. Supportive measures (for example shopping vouchers) can also be used to encourage a person to initiate and adhere to ART. NSW Health funds a range of services that the LHDs can access to fund appropriate supportive measures. These services and their contact details can be found in Section 7.

As HIV is a chronic illness, preventing transmission may require practices that must be maintained over a life time of the person with HIV. Directive strategies are difficult to sustain and may result in negative outcomes like mistrust of health workers.

1.1 Public health orders

The NSW *Public Health Act 2010* has mechanisms to direct a person's behaviours under certain circumstances using a public health order. A public health order may require a person to be tested, undergo treatment or be detained. Only in rare circumstances, and typically after exhausting other options, public health orders can be used to detain or require a person to take specific actions.

Further information on public health orders is in Section 4.3.

1.2 Public health risks

A person with HIV may pose public health risk if they engage in behaviours that do not consider HIV infection implications for others. It is unlikely that a single risk incident (for example, failing to adhere to ART during a short, exceptional circumstance) would be considered a public health risk. Single risk incident should be managed at a local level (see Section 4.1).

To assess whether there is a public health risk, the following needs to be considered:

- Whether the person's risk behaviour is current and likely to continue (risk behaviour may include: having a viral load of more than 200 copies/mL, or engaging in condomless sex or having sex with a partner not on PrEP and/or engaging in unsafe injecting practices
- The person's understanding of their HIV status and how their behaviour risks transmission of HIV to others
- Whether the person understands how they can prevent transmitting HIV
- Whether the person has access to reasonable precautions like access to ART, condoms and sterile needles and syringes
- The person's adherence to ART, engagement in care (including regular monitoring of HIV viral load)
- The person's cooperation and engagement with services in managing their transmission risk.

ROLES AND RESPONSIBILITIES

Person with HIV

A person with HIV is ultimately responsible for managing HIV transmission risks. If a person with HIV injects drugs, they are ultimately responsible for safe injecting practices.

There has been widespread education and information publicly available about HIV prevention through safe sex and injecting practices for many years.

If a person with HIV is known to be placing others at risk of infection, then collaborative efforts by health and other services (including Housing, Family and Community Services and non-government organisations) to support HIV treatment initiation and adherence may help address the risk of transmission.

Clinicians

Diagnosing clinicians (both specialists and general practitioners) are responsible for ensuring that their patients with HIV have access to the NSW HIV support program and five key support services, including:

1. Treatment
2. Psychosocial support
3. Counselling on prevention of infection to others
4. Support for partner notification
5. Linkage to services including specialist and community services.

This includes:

- Advising the person on their obligation under Section 79 of the NSW *Public Health Act 2010* to take reasonable precautions against spreading their HIV infection
- Monitoring engagement of the person with HIV with health services and following up where the person fails to engage or disengages from care
- Referring patients with complex care needs to specialist assessment and support, e.g., HIV community teams, AIDS Dementia and HIV Psychiatry Service (Adahps), NSW Partner Notification Service, and alcohol and mental health services (in accordance with the management framework (Section 4 of this Policy Directive)
- Referring patients to the Chair (for cases involving concerns about HIV transmission risks).

Local Health Districts

Local Health Districts (LHDs) are responsible for:

- Assigning a point of contact for people under management Level 1 or above (see Section 4) who can coordinate services and resources that are available and appropriate within the LHD for people who risk infecting others with HIV. The point of contact should be a senior health professional in the LHD who can liaise with the NSW Ministry of Health (the Ministry) and other service providers.

The LHD point of contact is responsible for:

- Identifying a clinical case coordinator where complex issues present
- Seeking advice from the Chair of the Panel for Management of People Who Risk Infecting Others (the Panel). The Panel consists of experts appointed by the Ministry to advise on complex HIV risk management issues (see Section 2.6 of this Policy Directive)
- Where the Panel's advice is sought:
    - submitting reports as requested
    - ensuring that an appropriate LHD representative (e.g. a clinical case coordinator or case coordinator) is available to present on the case at Panel meetings
    - implementing the Panel's recommendations.
- Monitoring and ensuring the person's ongoing engagement in care and
    - where the person relocates to another LHD, referring and ensuring linkage to a relevant service
    - consistent with National Guidelines for the Management of People with HIV Who Place Others at Risk, informing the Centre for Population Health (CPH, at the Ministry) if certain people under management relocate to another state or territory, to coordinate a formal communication from the Chief Health Officer (CHO) to another jurisdiction.
- Implementing an effective work health and safety management system for staff that seek out a client in the community in unknown environments. This must be in line with the Policy Directives on Work Health and Safety: Better Practice Procedures and Preventing and Managing Violence in the NSW Health Workplace – A Zero Tolerance Approach
- Implementing public health orders
- Acting as the point of contact for the Panel and the Ministry staff to liaise with about a person with HIV with risk behaviours in their LHD
- Following up on actions relevant to the LHD from Panel's recommendations (including following up on the implementation of the public health order).

At any stage, the LHD can contact the Chair for advice about management of a patient with HIV who may risk infecting others.

Centre for Population Health, NSW Ministry of Health and Health Protection NSW

The CPH and Health Protection NSW are responsible for:

- Providing secretariat support to the Panel and coordinating communication between the Panel and the CHO. The Panel secretariat is responsible for:
    - seeking reports from the clinician or other service provider responsible prior to the Panel meetings
    - providing Panel meeting minutes to the CHO. The minutes will include the Panel Chair's (the Chair) advice on the referrals received between regular Panel meetings and the Panel's deliberations and advice on cases under assessment or management
    - communicating all recommendations to the LHD and preparing and sending a letter from the CHO to the LHD Chief Executive (CE) in a timely way. This includes communicating key recommendations to the LHD point of contact informally prior to the letter from the CHO to the LHD CE.
- Referring HIV transmission risk issues brought by the LHD to the attention of the Ministry to the Chair and ensuring formal feedback is provided to the LHD in a timely and supportive way
- Obtaining and communicating advice from Legal and Legislative Services Branch as required
- Collaborating and partnering with other agencies to activate State-wide resources (e.g. from other NSW State agencies) to ensure transmission risk behaviours of a person with HIV are minimised
- Managing notifications of patients with HIV infection and referrals to the NSW HIV Support Program.

Panel for the management of people with HIV who risk infecting others

The Panel is responsible for:

- Providing expert advice (through collaboration with LHDs) to clinicians, LHDs and the CHO on strategies to minimise transmission risks. The Panel's membership and Terms of Reference are in Appendix 1.

Panel Chair

The Chair is appointed by the CHO and is responsible for:

- Providing advice and other responses to queries raised on public health risk concerns
- Referring cases to the full Panel where additional advice is needed
- Raising urgent or complex cases about alleged risks with the CHO via the Director, Population Health Strategy & Performance, CPH or their delegate.

The Chair's contact details are available at Appendix 1.

PRIVACY AND CONFIDENTIALITY

Information about a person's HIV status, testing or treatment is 'health information', and is regulated by the NSW *Health Records and Information Privacy Act 2002* and the NSW *Public Health Act 2010.*

LHDs, the Ministry, Health Protection NSW and all other service providers involved in the care of a person with HIV are responsible for maintaining the person's confidentiality and privacy.

Medical practitioners must not include a patient's name or address in a notification to the Secretary of the Ministry under Sections 54 or 55 of the NSW *Public Health Act 2010,* if the information relates to a person's HIV status. Under Section 56, a person who, in the course of providing a service, acquires information that another person has HIV, has been or is to be, or is required to be tested for HIV, must take all reasonable steps to prevent disclosure of that information. However, information about a person's HIV status may be disclosed:

- When the person consents to disclosure, or
- To a person involved in providing care, treatment or counselling to the person concerned, or
- To the Secretary of the Ministry, if a person has reasonable grounds to suspect that failure to disclose the information would likely present a risk to public health, or
- In connection with administration of the NSW *Public Health Act 2010* or the regulations, or
- For the purposes of legal proceedings arising from the NSW *Public Health Act 2010* or the regulations, including any report of those proceedings, or
- In accordance with a requirement imposed under the NSW *Ombudsman Act 1974,* or
- In circumstances prescribed by the regulations

Maximum penalty for breach of Section 56 is 100 penalty units or imprisonment for 6 months, or both.

LHDs should put in place reasonable measures to ensure that information about a person's HIV status is only disclosed in line with the above.

It is recommended that precautions be taken to ensure the person's identity remains confidential to services directly involved in the patient's management. Correspondence with services involved in the person's management should refer to the person using an alias or anonymous reference. If de-identifying using a 2x2 name of the patient, it should be first two letters of the last name, followed by first two letters of the first name, all capital letters. A person's name must be fully de-identified when there are only two letters in the person's names. De-identifying the person in correspondence relating to the person's management is important to guard against unintended disclosure to unauthorised third parties, e.g. as a result of accidentally misdirected emails, unauthorised access to emails, loss of files etc.

HIV information should not be disclosed to police except in response to a warrant or subpoena (noting that, if information has been provided to the Secretary of the Ministry under Part 4 or 5 of the NSW *Public Health Act 2010*, the Secretary of the Ministry cannot be compelled to disclose the information). If police request information about a person's HIV status or medical history in the context of an investigation of an allegation of intentional transmission of HIV, advice should be sought from the Ministry (CPH and Legal Branch).

Patient consent is required if a medical practitioner wishes to disclose a HIV positive patient's identity to the patient's sexual partner(s) or drug use contact(s). A signed consent is advisable in these circumstances. This does not limit the patient's attending medical practitioners' ability (in accordance with clause 39B of the *Public Health Regulation 2012)* to inform sexual partner(s) or drug contact(s) that they may be at risk of contracting HIV, without disclosing the HIV positive patient's identity. See Section 4.1.3.

For further information on privacy, see: Privacy Manual for Health Information at http://www.health.nsw.gov.au/policies/manuals/Pages/privacy-manual-for-health-information.aspx

THE MANAGEMENT FRAMEWORK

The management framework for people with HIV who risk infecting others includes following levels:

Management level	Summary of case management
Local management	The client is managed by the treating clinician(s) who can obtain advice from the Chair as required.
Level 1 supported management	The client is managed by the treating clinician(s) with support from the Panel. The client may be issued with a letter of warning.
Level 2 public health order	The client is managed by the treating clinician(s) with support from the Panel. An authorised medical practitioner has issued the client with a public health order, placing conditions about their behaviour, treatment, health care, and/or supervision or requiring the client to be detained.

Each level is discussed in detail below.

Initial steps: counselling, education and support

The clinician is primarily responsible for a person's HIV health care. The clinician is responsible to provide (or refer) a person with HIV to support and counselling at the time of diagnosis. This includes counselling on public health responsibilities and safe sex and injecting practices.

If a person is alleged to be behaving in a way that endangers, or is likely to endanger public health, as a first step, the clinician should clarify the person's understanding of their public health responsibilities and provide counselling and education to support behavioural change.

In some cases, the clinician may refer the patient to an experienced sexual health/HIV counsellor for regular and intensive counselling.

The involvement of other service providers may also assist. Where possible and appropriate, a community organisation with peer group involvement or relevant cultural knowledge and/or translator services should be involved to advise or support appropriate behaviour by the person.

If the behaviours or other issues presenting are likely to result in management challenges, the clinician should refer the case to the Chair.

The Chair is responsible to advise and support the clinician to effectively manage risks. The clinician will need to create a supportive environment where health promoting messages are clearly and frequently reiterated and the consequences of behaviours that place others at risk are spelt out. The means of prevention (including for instance, condoms, sterile needles and syringes and information) should be readily and easily accessible, along with access to regular health checks, testing and ART. Where a patient does not have a sustained undetectable viral load, the clinician should regularly discuss the risk to new partners, their access to PrEP (long term) or post-exposure prohylaxis (short term) and any contacts that need follow up because of their HIV infection risk.

Case conferencing

A case conference is often useful in developing a comprehensive care plan for the person. The complex needs often arise from cognitive/behavioural and/or mental health issues.

Case conference should involve all local services engaged in the care of the person. Services that should be included are:

- Adahps or other outreach teams (depending on the person's place of residence) – to assess and manage the person's risk behaviours
- Where possible, the Public Health Unit/Sexual Health Service (as nominated by the LHD) – to facilitate the involvement of service directors in the case conference, particularly when underlying problems, such as drug, alcohol and mental health issues contribute to the risk behaviours
- Aboriginal health worker or Multicultural HIV and Hepatitis Service (MHAHS) to advise when cultural issues are present and consideration should be given to getting interpreter services when language barriers present.

This case conference should not replace case conferences which occur in the context of good multidisciplinary clinical care for patients with chronic illnesses. The purpose of this case conference is to discuss issues relevant to the HIV risk and risk management.

Contact tracing or partner notification

The diagnosing clinician (or a delegate under their direction) must ensure that contact tracing (also known as partner notification) of sexual and/or needle sharing partners is conducted in accordance with appropriate ethical and legal standards.

Further guidance on contact tracing can be found on https://stipu.nsw.gov.au/wp-content/uploads/GP-Contact-Tracing-Tool.pdf. Local sexual health services or the NSW Sexual Health InfoLink (SHIL) can also provide further guidance on partner notification. The NSW Sexual Health InfoLink can be contacted on 1800 451 624.

Seeking advice from the Chair

At any stage, LHDs and service providers can contact the Chair where there are complexities or the person of concern has risk behaviour despite LHD and/or clinician having given advice or taken other steps . The Chair can provide direct advice to the LHD, or may choose to seek advice from the Panel.

The Chair will consider a range of matters including the public health risk, credibility of the information, the person's competence or co-morbidities, steps taken by the local clinician/local service, involvement of appropriate services, and the likelihood that local actions may succeed.

Level 1: Supported management

Cases concerning current or ongoing HIV transmission risks can be referred to the Chair for advice.

If the Chair considers on the basis of the information available, that the person may need management with support from the Panel, then a meeting of the Panel will be convened to discuss the case.

As the Panel has an advisory role, even though a case may be accepted under Panel management, the LHD remains responsible for public health and clinical care/case management functions. This includes where cases are complex or need longer term management strategies.

The LHD point of contact and the CPH will support effective communication between the LHD and the Panel.

Letter of warning

The Panel may recommend sending a letter of warning to the person of concern.

The letter of warning's purpose is to ensure that the person is aware of their responsibilities and to prompt a change in risk behaviours. It will also outline the person's public health responsibility to take reasonable precautions, options for preventing HIV transmission, and other expectations that the person should respond to (e.g. participating in counselling, attending HIV clinical services).

The clinician, Clinical Nurse Consultant, or the Public Health Unit must deliver the letter of warning in person, with discussion to ensure that the person understands the content of the letter. If appropriate and necessary, an Aboriginal health worker or MHAHS should be involved to overcome language barriers.

The directions in the letter of warning remain valid for two years from its issue unless revoked earlier. The Panel must consider at its meeting whether the person is complying with the directions in the letter of warning and whether further actions are required.

Before a letter of warning can be issued, there needs to be evidence of the person knowingly placing another at risk of infection. The evidence may include detectable viral load, lack of engagement with services, and/or psychosocial factors (e.g. sex work, homelessness, mental health issues) that may instigate risk taking behaviours.

Panel's ongoing assessment

The Panel will consider the follow up reports on the person's management at each of its regular meetings.

Officers of the Ministry's Legal and Regulatory Services can provide advice on these issues. Approaches to Legal and Regulatory Services should be made via the CPH.

Discharge from supported management

The Panel can decide to either continue to monitor the person's management or discharge them from Panel support, depending on:

- Whether actions recommended by the Panel were implemented
- The effectiveness of the actions implemented
- Whether the risk behaviours have stopped or have been reasonably managed
- Whether there is continuing information or evidence that the person is endangering others
- An assessment of the likelihood that the person will continue to present transmission risks.

CPH will communicate the discharge of the person from the Panel support to the LHD point of contact in a timely manner.

Level 2: Public health order

A public health order under the NSW *Public Health Act 2010* should be considered on a case-by-case basis. It should only be considered when such an order is judged the most effective way to prevent risk to public health, and where all other management options have been unsuccessful.

Where the Panel recommends that a public health order is issued, the Chair should verbally advise the CHO without delay, in consultation with the CPH, Health Protection NSW and Legal Branch. The LHD point of contact and Public Health Unit Director or delegate should meet to provide advice on public health orders if required.

A public health order can be modified on the subsequent recommendation of the Panel.

A public health order may require the person to do one or more of the following:

a) To refrain from specified conduct
b) To undergo specified treatment (including ARTs)
c) To undergo counselling by one or more specified persons or by one or more persons belonging to a specified class of persons
d) To submit to the supervision of one or more specified persons or of one or more persons belonging to a specified class of persons
e) To undergo specified treatment at a specified place.

A public health order may also require a person with HIV to be detained at a specified place for the duration of the public health order, and specify what the person is required to do during the detention. A public health order detaining a person on the basis that their HIV status and sexual activity presents a genuine risk to public health expires automatically at the end of 3-business days after the person is served with the order. The 3-day detention period can possibly be extended if an application is made to the NSW Civil and Administrative Tribunal (NCAT) to extend the detention period, and the person under the order is served with copies of the application to NCAT. NCAT will then be required to hold a hearing into the reasons for the detention, and has the power to confirm the public health order, vary the public health order and confirm it as varied or revoke the order under Section 64 of the NSW *Public Health Act 2010*.

Making the public health order

Authorised medical practitioners may make public health orders under Section 62 of the NSW *Public Health Act 2010.* Authorised medical practitioners are: the CHO or a registered medical practitioner authorised by the Secretary of the Ministry to exercise the functions of an authorised medical practitioner under Division 4 of the NSW *Public Health Act 2010.*

An authorised medical practitioner must take into account the principle that restriction of the liberty of the person should be imposed only if such restriction is the most effective way to prevent a real risk to the public. An authorised medical practitioner may issue a public health order if satisfied on reasonable grounds that a person:

- Has HIV; and
- Is behaving in a way that poses a risk to public health (e.g. has a detectable viral load and engages in condomless sex or has sex with a partner not on PrEP, and/or engages in unsafe injecting practices).

The public health order should specify what the person with HIV is required to do and the duration of the order.

The LHD point of contact has responsibility for implementing a public health order and advising the CHO that it has been served to the person.

Key decisions and record of decisions

The Chair must record the advice provided to LHDs, clinicians and others in a file note, and report to the Panel on advice provided to LHDs, clinicians and others at the Panel meetings.

The Chair is responsible for ensuring that the rationale, decisions and recommendations are made both at the Panel meeting and outside the meetings. The recording of these will normally be made by the Panel secretariat in the form of confidential minutes, which are reviewed and approved by the Chair.

Accurate record keeping is required in all instances.

CUSTODIAL SETTINGS

If a person under the Panel's management is remanded in custody by NSW police (while awaiting a court hearing or following a court sentencing), the Panel will consider whether they remain under the management or be discharged, on a case by case basis.

Corrective Services NSW is responsible for securing the person and the Justice & Forensic Mental Health Network (JH&FMHN) is responsible for the healthcare of the person.

The Panel may provide advice to JH&FMHN having consideration for:

- The inmate's confidentiality, legal and safety issues
- The level of negotiation required with the JH&FMHN, Corrective Services NSW and/or Juvenile Justice NSW.

Where an inmate has been known to the Panel, it is important to ensure planning occurs prior to their release from the prison. JH&FMHN, in conjunction with the CPH must inform the LHD where the person is likely to live after release. JH&FMHN and the LHD should follow a discharge plan to ensure that the person is not lost to care. The inmate should be managed under the Persons in Custody HIV Referral Project, a joint initiative between Adahps, JH&FMN and the HIV community teams that connect inmates who are HIV positive to an appropriate service in the area where they will live on release.

REFERRAL TO NSW POLICE

Intentionally or recklessly infecting a person with HIV is a serious criminal offence under the NSW *Crimes Act 1900*.

The LHD should contact the CPH through the Panel secretariat:

- Immediately where there are clear grounds for a charge involving intentionally causing serious bodily harm
- After further examination and/or management strategies, of unwillingness to alter behaviour that may recklessly or negligently endanger or cause serious harm.

Any concerns or evidence of this type of behaviour (e.g. through partner notification) or of breaches of a public health order should be referred to the Ministry for consideration and appropriate action. This includes possible referral to the NSW Police Force, which must be done by the Ministry on advice from the Panel or the Chair. Charges for intentionally infecting others with HIV trigger Level 1 management under the Panel.

Members of the public, who believe they may have been intentionally or recklessly infected with HIV, may choose to report to the police directly.

USEFUL CONTACTS

Panel Chair
The Chair of the Panel is the Director of Sydney Sexual Health Centre. The Sydney Sexual Health Centre can be contacted on 9382 7440.

In the event of absence of the Chair, contact the head of Sexually Transmissible Infections Programs Unit (STIPU), Sydney Sexual Health Centre.

Panel Secretariat
For information on Panel referrals and advice on this Policy Directive contact: MOH-BBVSTI@health.nsw.gov.au or 9391 9214.

Sexual Health Clinics

A list of Sexual Health Clinics and their contact details can be found on http://www.health.nsw.gov.au/sexualhealth/Pages/default.aspx or call the NSW.

NSW Sexual Health InfoLink (SHIL)

For guidance on partner notification, contact SHIL on 1800 451 624.

The HIV Support Program (HSP) and 5 key support services

Any doctor can self-request support from the HSP. Contact the NSW Health Communicable Disease Branch on 02 9391 9195 and ask to speak with an HIV Surveillance Officer. HSP coordinators strive to contact diagnosing doctors before the doctor gives an HIV diagnosis to a patient but this is not always possible.

Support services

- **Aboriginal Health & Medical Research Council –** Council to represent, support and advocate for Aboriginal communities on Aboriginal health.
  Contact: 02 9212 4777, ahmrc@ahmrc.org.au, http://www.ahmrc.org.au/

- **ACON –** Provides peer focused support to end HIV transmission among gay and homosexually active men and promotes lifelong health of lesbian, gay, bisexual, transgender and intersex (LGBTI) people.
  Contact: 02 9206 2000, acon@acon.org.au, https://www.acon.org.au/

- **Bobby Goldsmith Foundation (BGF) –** Provides a range of support and interventions that address key determinants of poor health outcomes for people living with HIV. BGF provides direct financial and practical assistance, emotional support, financial counselling, housing, study and employment support to the most vulnerable and disadvantaged people living with HIV.
  Contact: 02 9283 8666

- **Multicultural HIV and Hepatitis Service (MHAHS) –** Organisation working with culturally and linguistically diverse (CALD) communities in NSW to improve health and wellbeing in relation to HIV, hepatitis B and hepatitis C.
  Contact: 02 9515 1234, info@mhahs.org.au, http://mhahs.org.au/index.php/en/

- **NSW Users and AIDS Association (NUAA) –** A community-based organisation governed, staffed and led by people with lived experience of drug use that provides education, practical support, information and advocacy to users of illicit drugs, their friends, and allies.
  Contact: 02 8354 7300, nuaa@nuaa.org.au, https://nuaa.org.au/

- **Positive Life NSW –** Promotes a positive image of people living with and affected by HIV with the aim of eliminating prejudice, isolation, stigma and discrimination.
  Contact: 02 9206 2177, contact@positivelife.org.au, www.positivelife.org.au

- **PozHet –** Organisation located and managed day-to-day through the Community HIV Service in the Sydney LHD to promote the health and wellbeing of heterosexual people with HIV, their partners and family across NSW through community education, peer support and linkage to health and social services.
  Contact: 1800 812 404, pozhet@pozhet.org.au, https://pozhet.org.au/

- **Sex Workers Outreach Project (SWOP) –** A peer education sex worker organisation focused on HIV, STI and hepatitis C prevention, education and health promotion for sex workers in NSW.
  Contact: 02 9206 2166, swopconnect@swop.org.au, https://swop.org.au/

Organisations to support management of people with HIV related cognitive impairment, multiple comorbidities and complex psychosocial issues

- **Adahps** – AIDS Dementia and HIV Psychiatry Services is a specialist state-wide tertiary outreach service for people with HIV related cognitive impairment, multiple comorbidities and complex psychosocial issues.
  Contact: 02 9382 8600, adahps@health.nsw.gov.au,www.health.nsw.gov.au/adahps

- **South East Sydney LHD Community HIV Outreach Team –** A multidisciplinary team including nurses, dieticians, social workers and an occupational therapist that provides health care services for people living with, or closely affected by HIV across the South East Sydney LHD and Illawarra Shoalhaven LHD.

  Contact: 02 9382 8666, SESLHD-HIVCommunityTeam@health.nsw.gov.au,
  http://www.seslhd.health.nsw.gov.au/HIV_Outreach_Team/aboutus.asp

- **South Western Sydney LHD HIV Outreach Team –** Provides multidisciplinary care for people living with HIV in the South-Western Sydney LHD. The team includes specialist physicians, psychiatrist, and health professionals in the areas of nursing, social work, and dietetics.
  Contact: 02 8738 8372, www.swslhd.health.nsw.gov.au/liverpool/immunology/HIV_AIDS.html

- **Sydney LHD Community HIV Service (Positive Central) –** Provides specialist allied health case management support for people with HIV, including occupational therapy, social work, physiotherapy and dietetics.
  Contact: 02 9395 0444, www.slhd.nsw.gov.au/communityhealth/HIVCommunity/services.html

APPENDIX: PANEL TERMS OF REFERENCE

The role of the Panel

The Panel provides expert advice to the CHO, LHDs, and specialist clinicians on managing people who risk transmitting HIV to others.

The person's LHD of residence is responsible for coordinating management strategies recommended by the Panel.

Panel membership

Permanent members of the Panel include:

- Chair, an individual with extensive experience in the clinical management of HIV and sexually transmissible infections
- A professional with expertise in the management of people with HIV and complex needs
- A representative of HIV community organisations
- A nominee of the NSW Public Health Directors network
- A professional ethicist.

The Director, Health Protection NSW or their nominee and Director Population Health Strategy & Performance, CPH or their nominee also hold Panel membership. Their role is to advise on NSW health policy, the relevant legislation and service options that may assist in resolving risks and in implementing the Panel's recommendations.

The CHO appoints Panel members and the Chair.

Panel membership is reviewed every two years.

The Chair and all participants in Panel meetings are indemnified by the NSW Treasury Managed Fund in relation to advice provided in the course of the work of the Panel.

The Panel secretariat is an officer nominated by the Executive Director, CPH.

Standards of conduct and conflicts of interest
Panel members must conduct themselves in a professional manner and abide by the NSW Health Code of Conduct while performing duties as part of the Panel.

Members must not disclose official information or documents acquired as a result of their membership, other than as required by law, or when the member has been given proper authority to do so.

Members must declare any actual or perceived conflicts of interest to the Committee Chair as they become known to the member. Conflicts of interests reported by members will be managed in accordance with Conflicts of Interest policy.

Context for the Panel
The Panel supports a well-established framework for managing people with HIV whose behaviours present a public health risk. The framework is based on the principle that most people with HIV are motivated to avoid infecting others and will respond to counselling, education, and access to resources for the prevention of transmission, and services supporting the specific needs of individuals.

The framework allows for a variety of management strategies proportionate to the risk of transmission. Less restrictive strategies will generally be the most sustainable and effective in the long term. To date, application of the framework has effectively stabilised behaviours, therefore averting the need for public health orders in most cases.

Panel Meetings
The Panel meets at least every four months, with additional meetings as needed. Panel members are expected to attend Panel meetings with teleconferencing reserved for exceptional circumstances.

At a minimum, the Panel will receive a report from the Chair on the activities and queries she received since the previous meeting, as well as the advice she provided and reports on progress of those being managed by LHDs with advice from the Panel.

Where the Chair initially assesses a new case as being likely to require intensive management, the person's clinician or referring LHD officer will complete an initial report and will present the case when initially discussed by the Panel. Where a case is under Levels 1 or 2 Panel Management, the LHD will nominate a case coordinator. The case coordinator will ensure that official reports are updated and submitted to the Panel when requested by the Secretariat.

The Chair will invite the clinician or case coordinator to Panel meetings to present on the case. The Chair may invite additional experts to contribute to the Panel's deliberations. Where a case remains under Level 1 management because of pending legal issues and there is no identified risk of transmission the clinician/case coordinator may not need to participate.

The Secretariat is responsible for coordinating the submission of Panel reports and maintaining minutes of the meeting. Minutes will be reviewed and approved by the Chair.

CPH will provide a summary of agreed actions to Panel members immediately after meetings, communicate about relevant actions that need follow up, and monitor implementation of the actions between meetings.

HIV, HEPATITIS B AND HEPATITIS C – MANAGEMENT OF HEALTH CARE WORKERS POTENTIALLY EXPOSED (PD2017_010)

PD2017_010 rescinds PD2017_009, PD2005_311

PURPOSE

Human immunodeficiency virus (HIV), hepatitis B and hepatitis C may be transmitted by significant percutaneous or mucosal exposure to infective blood or other infective body substances. Occupational exposure is defined as an incident that occurs during the course of a person's employment and involves direct contact with blood or other body substances. Such exposures may put the person at risk of acquiring a blood borne virus infection. The purpose of this Policy Directive is to assist Health Services to appropriately assess and manage a health care worker following an occupational exposure in order to prevent disease transmission.

MANDATORY REQUIREMENTS

All health facilities within the NSW public health system are required to implement this Policy Directive. It is also recommended that licensed private health care facilities have regard to this Policy Directive.

Facilities must ensure that:

- An efficient local system is established for reporting and managing potential exposures of HCWs (including non-LHD, non-hospital based health staff or volunteers) to blood borne viruses
- HCWs (including non-LHD, non-hospital based health staff or volunteers) and source patients have access to blood borne virus testing, as appropriate, following an occupational exposure
- Confidentiality is maintained for all testing and reporting relating to occupational exposures
- All staff are aware of whom to contact for advice regarding occupational exposures
- Expert advice is available to all HCWs (including non-LHD, non-hospital based health staff or volunteers) 24 hours a day following a potential BBV occupational exposure to enable rapid assessment and, if needed, timely administration of prophylaxis
- All occupational exposures are reported to SafeWork NSW as required under the *Work Health and Safety Act* (s35 and 36) and *Work Health and Safety Regulation* (cl699) (Refer to SafeWork NSW Factsheet http://www.safework.nsw.gov.au/media/publications/health-and-safety/when-to-notify-blood,-body-fluid-and-needlestick-exposure-incidents)
- HCWs are able to obtain the support to which they are entitled, including access to an Employee Assistance Program or workers compensation if appropriate as documented in NSW Policy Directive *Employee Assistance Program* (PD2016_045)
- The local Public Health Unit is notified in the rare event that hepatitis B or hepatitis C is transmitted from a patient to a health care worker.

Health care workers must ensure that:

- All exposures to blood and body substances are reported as per local protocols.

IMPLEMENTATION

Sections 2 to 5 describe the procedures to be followed by health care workers and health facilities in the event that a health care worker is potentially exposed to a blood borne virus following an occupational exposure.

1. BACKGROUND

1.1 About this document

Human immunodeficiency virus (HIV), hepatitis B and hepatitis C may be transmitted by significant percutaneous or mucosal exposure to infective blood or other infective body substances. Occupational exposure is defined as an incident that occurs during the course of a person's employment and involves direct contact with blood or other body substances. Such exposures may put the person at risk of acquiring a blood borne virus infection.

Adherence to infection prevention and control practices as outlined in the current version of the NSW *Infection Control Policy* remains the first line of protection for health care workers (HCWs) against occupational exposure to HIV, hepatitis B and hepatitis C. The policy and guidelines for the NSW Health Service on prevention of sharps injuries are documented in the NSW Policy Directive *Sharps Injuries – Prevention in the NSW Public Health System* (PD2007_052). The current version of the NSW Policy Directive *Occupational Assessment, Screening and Vaccination Against Specified Infectious Diseases* mandates that health staff directly involved in patient care and/or the handling of human tissue, blood or body fluids complete the full course of hepatitis B vaccination and provide their post vaccination serology result.

This policy directive outlines the procedures that should be followed in the event of an occupational exposure including:

- The immediate care to be taken by the exposed HCW
- An assessment of the risk of blood borne virus transmission
- Management of the exposed HCW including blood borne virus testing and post exposure prophylaxis.

1.2 Key abbreviations and definitions

Appropriately skilled officer – means a medical practitioner or nurse with expertise in the assessment of the risk of blood borne virus transmission and the management of the exposed HCW following an occupational exposure

anti-HBs – antibody to hepatitis B surface antigen

BBV – blood borne virus. Refers to HIV, hepatitis B and hepatitis C viruses.

HBV – hepatitis B virus

HBIG – hepatitis B immunoglobulin

HBsAg – hepatitis B surface antigen

HCW – health care worker. Refers to all persons working in healthcare settings who have the potential for exposure to infectious/potentially infectious body fluids. This also includes non-LHD, non-hospital based health staff and volunteers.

HCV – hepatitis C virus

HIV – human immunodeficiency virus

PCR – polymerase chain reaction

PEP – post exposure prophylaxis

Source - person from whom blood or body fluids originated

Window period – refers to the time after a person has been exposed and is the maximum time it takes for a test to give an accurate result

Legal and legislative framework

Health Services have obligations under the *Work Health and Safety Act* 2011 (NSW) and the *Public Health Act* 2010 (NSW) and their associated regulations.

2 IMMEDIATE CARE OF THE EXPOSED HEALTH CARE WORKER

After exposure to blood or other body substances the exposed HCW should as soon as possible do the following:

- Wash the exposure site with soap and water
- Undertake appropriate care of any wound(s)
- If eyes are contaminated then rinse them, while they are open, gently but thoroughly with water or normal saline
- If blood or other body substances get in the mouth, spit them out and rinse the mouth with water several times
- If clothing is contaminated remove clothing and shower if necessary
- Inform their line manager so they can immediately be relieved from duty and notify the appropriately skilled officer who is designated to conduct an urgent risk assessment on potentially exposed staff (as per local reporting procedures) to ensure that necessary further action is undertaken.

Sections 2 to 5 outline the procedures to be followed by health care workers and health facilities following an occupational exposure. Refer to Appendix A for a summary of these procedures and Appendix B for a summary of recommended laboratory testing.

RISK ASSESSMENT OF THE EXPOSURE

In the event of an occupational exposure, appropriately skilled officer/s should conduct a risk assessment immediately. The first step in the risk assessment is to establish the type of injury (see Table 1). Following this, consideration should be given to the body fluid involved (see Table 2).

Table 1: Risk of transmission of blood borne viruses from an infectious bodily fluid, by injury type (based on UK guidelines[1])

Level of risk	Injury type
Higher risk injury	• Deep percutaneous injury • Visible blood on sharps • Needle used on source's blood vessels
Lower risk injury	• Superficial injury, exposure through broken skin, mucosal exposure (usually splashes to eye or mouth) • Old discarded sharps • No visible blood on sharps • Needle not used on blood vessels e.g. suturing, subcutaneous injection needles
Injury with no risk	• Skin not breached • Contact of body fluid with intact skin • Needle (or other sharp object) not used on a patient before injury

Table 2: Body fluids and risk for blood borne virus transmission (based on UK guidelines[1])

Level of risk	Body fluid
Infectious (good evidence of BBV transmission following occupational exposure)	• Blood • Visibly bloody body fluids
Potentially infectious (risk of BBV transmission following occupational exposure unknown)	(In alphabetical order): • Amniotic fluid • Cerebrospinal fluid • Human breast milk • Pericardial fluid • Peritoneal fluid • Pleural fluid • Saliva in association with dentistry (likely to be contaminated with blood even when not visibly so) • Semen • Synovial fluid • Tissue fluid from burns or skin lesions • Vaginal secretions
Not infectious (unless visibly blood stained)	• Nasal secretions • Saliva (non-dentistry associated) • Sputum • Stool • Sweat • Tears • Urine • Vomit

Where the exposed HCW is uncertain about actions to be taken, the Blood and Body Fluid Exposure Phoneline (formerly the NSW Needlestick Hotline) may assist. The Blood and Body Fluid Exposure Phoneline is an information, support and referral service for NSW based health care workers who sustain needlestick injuries and other blood/body fluid exposures during the course of their work. The line is answered by an on-call nurse 7 days a week from 7am to 11pm and can be contacted on free call 1800 804 823 within NSW. The Exposure Phoneline is not a reporting or surveillance service.

4 MANAGEMENT OF EXPOSURES WITH NO RISK OF BLOOD BORNE VIRUS TRANSMISSION

Occupational exposures are not considered to have the potential for blood borne virus transmission if **either** the injury is classified as no risk (Table 1) **or** the body fluid is not infectious (Table 2). For such exposures, no further action with respect to the health worker is required other than an opportunistic assessment of his/her protection against hepatitis B in accordance with the current NSW Policy Directive *Occupational assessment, screening and vaccination against specified infectious diseases*. Post exposure prophylaxis (PEP) is not indicated and testing of the source patient is not required. Such workers should be advised that the potential side effects and toxicity of taking HIV PEP outweigh the negligible risk of transmission posed by this exposure regardless of the HIV status of the source patient. No HCV or HIV testing of the exposed HCW is required.

A risk assessment of the incident should be conducted and local documentation procedures should be followed after each potential exposure.

MANAGEMENT OF EXPOSURES WITH POTENTIAL FOR BLOOD BORNE VIRUS TRANSMISSION

An occupational exposure has the potential for blood borne virus (BBV) transmission if the injury carries a risk (see table 1) **and** the body fluid is infectious/potentially infectious (see table 2). Following all such exposures a risk assessment of the incident should be conducted.

Post exposure prophylaxis

Post exposure prophylaxis (PEP) is available following exposure to HIV and hepatitis B. It is recommended for all higher risk injuries involving an infectious/potentially infectious body fluid. It should be considered for lower risk injuries involving an infectious/potentially infectious body fluid (see Tables 1 and 2).

Greater efficacy is achieved the earlier prophylaxis is administered (ideally within 1-2 hours of exposure). The initiation of PEP should not be delayed while awaiting laboratory testing of either the source patient or the health care worker. The continuation of PEP should be reconsidered once laboratory results become available. Further information on PEP is found in section 5.2.3 (for HIV) and 5.2.4 (for HBV). Prophylaxis can be commenced up to 72 hours post exposure.

Risk assessment of the source patient

Following occupational exposures that carry a risk of BBV transmission, officer/s conducting the risk assessment should seek information on the BBV status of the source patient as soon as is practicable.

If the blood borne virus status of the source patient at the time of the incident is unknown, the staff conducting the risk assessment should arrange for the source patient to be tested as soon as practicable for HIV, HBV and HCV infection (refer to Table 3). Results of source testing will better inform the exposed HCW about the risk of transmission and where PEP has been initiated, inform the need for continuation. Informed consent for testing must be obtained from the source patient. The exposed HCW should not approach the source patient for consent. If the patient does not provide consent, testing cannot occur. Consent should also be sought for the results of testing to be provided to the exposed HCW.

Occupational exposures occurring during autopsies should be managed as set out in section 5.2.2.

Note that testing of the source patient for HBV infection is not required if the exposed HCW has previous documented evidence of immunity to hepatitis B (anti-HBs level ≥10 mIU/mL at any time or HBcAb positive). Viral load should be measured for source patients who are known, or discovered, to be infected with HIV, HCV or HBV. The source should be offered immediate referral to a specialist service if a previously undiagnosed blood borne virus is detected.

Table 3: Recommended testing of source patient [#]

- Combined HIV antigen and antibody immunoassay (fourth generation HIV test)
- Hepatitis B surface antigen (not required if HCW has hepatitis B immunity)
- Hepatitis C antibody*

[#] Viral load should be measured for source patients who are known, or discovered, to be infected with HIV, HCV or HBV

*Consider qualitative hepatitis C RNA testing if individual is at risk of hepatitis C infection as may be antibody negative in acute infection and remain negative for up to 12 months if immunocompromised.

Source potentially in the window period

If the source patient tests negative for BBV infection but reports a recent (within previous three months for HIV or six months for HBV and HCV) risk behaviour that places them at high risk for infection, he/she should be advised to seek medical attention if they develop signs and/or symptoms of primary infection. For their own health benefit, they should also be advised to undergo testing for that BBV six weeks and 12 weeks after the exposure. If the source is at risk of a recent hepatitis B or C infection final tests should be done at 24 weeks after exposure.

Follow up and documentation of source testing is not required by staff managing the occupational exposure as it will not influence the care of the exposed HCW (due to timing of results). Until such time as infection can be excluded in the source, the exposed HCW should be managed as for exposure to a positive source.

The risk assessment of the source patient is outlined in Table 4.

Table 4: Risk assessment of source patient (based on UK guidelines[1])

Level of risk	Source
Higher risk source	• Known to be infected with one or more blood borne viruses (viral load and treatment status unknown) • Known to have a detectable viral load for one or more blood viruses • Unknown viral load but known to have advanced or untreated blood borne infection • Blood borne virus status unknown and known risk factors*
Lower risk source	• Infected with a blood borne virus but known to have a fully supressed viral load • Unknown viral load but receiving long term antiviral treatment for blood borne virus with good adherence and known to be stable • Blood tests at/near to the time of the incident were negative for all three blood borne viruses but source reports ongoing risk factors for blood borne viruses • Blood borne virus status unknown but had no known risk factors for such viruses
Source with minimal or no risk	• Recent blood test that was negative for all three blood borne viruses and no recent risk behaviours reported

* Example of risk factor may include intravenous drug use, men who have sex with men, origin or unprotected sexual intercourse with a sexual partner from high prevalence area for either HIV infection, or hepatitis B or hepatitis C.

Source negative for HIV, HBV and HCV

In the event that the source undergoes testing and is found to be negative for HIV, HBV and HCV and does not report recent behaviour that may place them at risk of a blood borne virus then no further action is required. PEP, if commenced, should be discontinued. If there is reason to suspect the self-reported risk history of the source may unreliable or incomplete, the exposed HCW should be managed as per exposure to a positive source (refer to sections 5.2.3 to 5.2.5).

Source with unknown infectious status and source unable to be tested

If the status of the source is not known then the risk of the source being positive for HIV, HBV and HCV must be assessed from the available information relating to risk factors known to be associated with BBVs (e.g. intravenous drug use, male homosexual sex and origin or sexual partner from a high prevalence area). If there is a risk of the source being infected with HIV, HBV or HCV then the exposed HCW should be managed as per exposure to a positive source (refer to sections 5.2.3 to 5.2.5).

Source positive or potentially positive for HIV

Risk of HIV transmission from positive source patient

The overall risk of acquiring HIV infection following occupational exposure to HIV is low. The average risk of HIV transmission (without prophylaxis) after a percutaneous exposure to HIV infected blood has been estimated to be 0.3% (95% confidence interval (CI): 0.2-0.5%). [2] The risk of seroconversion following mucous membrane exposure is estimated to be 0.09% (95 % CI: 0.006%-0.5%) and the risk following non-intact skin exposure is estimated to be even lower. [2]

A case control study conducted by the US Centers for Disease Control and Prevention showed that significant risk factors for HIV infection were deep injury (odds ratio (OR) = 15, 95% CI: 6.0-41), injury with a device that was visibly contaminated with the source patient's blood (OR= 6.2, 95% CI: 2.2-21), a procedure involving a needle placed in the source patient's artery or vein (OR =4.3, 95% CI 1.7-12), and exposure to a source patient who died of the acquired immunodeficiency syndrome within two months afterward (OR=5.6; 95 %CI: 2.0-16)[3].

There have been no confirmed cases of HIV infection in a HCW following an occupational exposure in NSW since 1994 and nationally since 2002. Only one confirmed case of occupational HIV acquisition (involving a laboratory technician working with a live HIV culture) has been reported in the US since 1999[4]. There has only been one other case report of occupational HIV transmission in the developed world published since 2005. In this instance, a nurse acquired HIV following a needle stick injury from a patient (not previously known to have HIV) with a high viral load[5]. Due to delayed reporting of the incident, PEP was not given. Table 5 shows a summary of the occupational exposure registry reviews published in the international literature since 2005.

Table 5: Evidence of HIV transmission following occupational exposure

Country	Time period	No. of HCW exposures to HIV	No. HIV sero-conversions (rate)	Notes
Australia[6]	2000-2003	13	0 (0%)	Includes percutaneous and mucous membrane exposures. All given PEP
Brazil[7]	1997-2009	80	0 (0%)	Includes only percutaneous injuries. No information provided on PEP
Denmark[8]	1999–2012	276	0 (0%)	Includes percutaneous and mucous membrane exposures. All given PEP
Germany[9]	2010-2012	51	0 (0%)	Includes only percutaneous injuries. PEP (3 drugs, mean time to start 75 mins > exposure) given to 35/51 and for other 16 cases the source patient was known to have a viral load <20 copies/mL at time of incident.
Netherlands[10]	2003-2010	60	0 (0%)	Includes only percutaneous injuries. No information provided on PEP
Thailand[11]	1996–2014	84	0 (0%)	Includes percutaneous, mucous membrane and non-intact skin exposures. All offered PEP, completed in 62/84 instances.
United Kingdom[12]	2004-2013	1478	0 (0%)	Includes percutaneous, mucous membrane and non-intact skin exposures. 1135 (77%) given PEP.

Post exposure prophylaxis (PEP)

Based on evidence from animal models and what is known about primary HIV infection, there is a window of opportunity following exposure to HIV, during which antiviral medication may prevent infection. However, the evidence for efficacy of PEP in preventing HIV acquisition is limited[13,14]. A small US case-control study of HIV seroconversion in HCWs after percutaneous exposure published in 1997 provided the first evidence in humans that PEP seemed to be protective against infection[3]. This study found that zidovudine PEP was associated with an 81% reduction in the odds of infection after adjustment for relevant exposure risk factors. There have been 24 reports of PEP failure following occupational needle stick exposures in the literature[15]. In over three quarters of these instances, zidovudine only was used; only six instances of PEP failure in the context of occupational needle stick injury have been reported with multi-drug regimens with three of these occurring after 1999. Factors that may have contributed to the failure of the combination drug PEP include drug resistance (in 3 cases the HCW was found to be infected with a strain resistant to the PEP regimen), exposure to a high HIV viral load and delayed initiation of PEP.

Multi-drug regimens are now prescribed to prevent HIV infection following exposure. However, there is no definitive evidence to support a two versus a three-drug regimen. Instead, the additional benefit of a third drug must be weighed against the cost and potential harms.

While newer HIV antiretrovirals are less toxic and better tolerated than the older HIV drugs, adverse effects still occur. In addition, serious drug interactions can occur when antiretroviral agents are used with certain other drugs. More commonly reported side effects include nausea, vomiting, diarrhoea and fatigue. Rare, but important side effects of tenofovir include acute renal failure and proximal renal tubolopathy (Fanconi's syndrome). There is a small risk of rhabdomyolysis with raltegravir.

The need for HIV PEP depends on an assessment of the risk of transmission and consideration of the potential adverse effects. Where possible, information concerning the source's stage of HIV infection, viral load, resistance testing and history of therapy and medication adherence should be ascertained so that the most appropriate therapy and counselling can be offered. While the evidence supports a significantly lower risk of HIV transmission following sexual exposure to a source with an undetectable viral load, such evidence does not exist for occupational exposures. While it is assumed there is also an extremely low risk of HIV transmission, it is still reasonable for a healthcare worker who has had a higher risk exposure to a source who is HIV positive but with an undetectable viral load to complete the course of PEP. The recommended PEP regimen is outlined in Table 6. Refer to Appendix C for the antiretroviral drug regimens recommend by the Australasian Society of HIV Medicine.

Table 6: PEP recommendations following occupational exposure to HIV positive source

Injury type	Source viral load known to be undetectable	Source not on treatment or on treatment with detectable or unknown viral load
Needlestick injury or other sharps exposure	Consider 2 drugs	3 drugs
Mucous membrane or non-intact skin exposure	Consider 2 drugs	Consider 3 drugs

Any medical officer can prescribe a PEP starter pack (lasting 3 to 7 days). The recommended course of PEP is 28 days. A prescription for the remainder of the PEP course must be obtained from a clinician experienced in the administration of drugs for the treatment of HIV.

Where there is a risk that a woman may be pregnant, undertake a serum beta HCG urgently. If possible, contact an HIV experienced Infectious Disease or Sexual Health Physician before starting HIV prophylaxis for a woman who is pregnant or at risk of pregnancy. Where it is not immediately possible and the risk of contracting HIV appears to outweigh any potential risk for the pregnancy commence prophylaxis and advise making an appointment with an HIV experienced physician for the next working day. Truvada® and Combivir® are category B3 drugs which means that there is limited data relating to safety in pregnancy but no human evidence of harm.

Exposed HCW testing recommendations

It is recommended that 4th generation HIV antibody/antigen testing be conducted at 6 weeks. A negative test at 6 weeks is likely to exclude infection but the exposed HCW should be retested at 12 weeks to definitively exclude infection. HIV viral load tests have the capacity to detect early HIV infection before antibody development and should be considered following higher risk exposures to a higher risk source. Longer follow up with additional testing may also be indicated in complex cases (e.g. possibility of coinfection) as directed by an expert clinician.

Advice for the exposed HCW during follow up period

During the follow up period the exposed HCW should be advised:

- Not to donate plasma, blood, body tissue, breast milk or sperm
- To protect sexual partners by adopting safe sexual practices (use of condoms)
- To seek expert medical advice regarding pregnancy and/or breastfeeding
- To seek medical attention about any acute illness (i.e. fever, rash, myalgia, fatigue, malaise, lymphadenopathy, anorexia).

Modification to work practices (including avoidance of exposure prone procedures) is not required on the basis of an occupational HIV exposure.

Source positive or potentially positive for HBV

Susceptibility of the exposed HCW to HBV infection

In accordance with the current NSW Policy Directive *Occupational Assessment, Screening and Vaccination Against Specified Infectious Diseases* all staff who have direct contact with patients, deceased persons, blood, body substances or infectious material or surfaces/equipment that might contain these must complete a full course of hepatitis B vaccination and/or provide serological evidence of protection.

If the exposed HCW has a documented protective response (anti-HBs level ≥10 mIU/mL) at any time following completion of the vaccination course, then he/she is considered immune to hepatitis B and no further action (i.e. testing of the source patient or post exposure prophylaxis) is required regardless of the exposure. If the response to previous vaccination is unknown, the anti-HBs level of the exposed HCW should be determined as quickly as possible. If immunity status cannot be determined quickly then the HCW should be managed as a susceptible person until such time that evidence of immunity is available.

The following provisions relate only to those who are presumed susceptible to HBV infection (those with anti-HBs level <10 mIU/mL and who are hepatitis core antibody negative).

Risk of HBV transmission from positive source patient

The probability of infection following exposure to a susceptible person depends on a number of factors including the volume and infectiousness of the body fluids and the route of the exposure. Occupational HBV transmission primarily occurs via percutaneous and mucosal exposure to blood. Of viral parameters, the risk of infection best correlates with viral load (HBV DNA) rather than hepatitis B serology. The presence of hepatitis B e antigen (HBeAg) is a surrogate marker for high viral load.

In studies of hepatitis B susceptible HCWs who sustained injuries from needles contaminated with blood containing HBV, the risk for developing clinical hepatitis if the blood was both HBsAg-positive and HBeAg-positive was 22%–31%, and the risk for developing serologic evidence of HBV infection was 37%–62%. By comparison, the risk for developing clinical hepatitis from a needle contaminated with HBsAg-positive, HBeAg-negative blood was 1%–6%, and the risk for developing serologic evidence of HBV infection was 23%-37%.[17]

Post exposure prophylaxis (PEP)

Where indicated (see Section 5.1) HBV post exposure prophylaxis with hepatitis B immunoglobulin and vaccine should be offered to non-immune and non-infected individuals in accordance with the recommendations in the current edition of the Australian Immunisation Handbook (refer to Appendix D). Requests for hepatitis B immunoglobulin should be directed to the local hospital blood bank.

Source testing recommendations

If a source is known or found to be HBsAg positive, then HBeAg and quantitative HBV DNA testing of the source patient should be performed, with the consent of the source, so that the exposed HCW can be counselled appropriately about the risk of transmission.

Exposed HCW testing recommendations

The exposed susceptible HCW should undergo HBsAg testing at 6 weeks, 12 weeks and 24 weeks. In the rare event that an exposed HCW is newly diagnosed with HBV infection, the local Public Health Unit should be notified. Post-vaccination serological testing is recommended 4 to 8 weeks after completion of the vaccination course.

Advice for the exposed HCW during follow up period

During the follow up period the exposed HCW should be advised:

- Not to donate plasma, blood, body tissue, breast milk or sperm
- To seek medical attention if they develop signs and/or symptoms of acute hepatitis (i.e. anorexia, vague abdominal discomfort, nausea and vomiting, fatigue and/or jaundice)

The exposed HCW is not required to modify sexual practices provided that HBV PEP has been administered on time. Ideally the HCW should refrain from becoming pregnant until completion of the vaccination course. There are no restrictions regarding breastfeeding. Modifications to work practices (including avoidance of exposure prone procedures) are not required on the basis of an occupational HBV exposure.

Source positive or potentially positive for HCV

Risk of HCV transmission from positive source patient

Overall, the risk of HCV transmission following an occupational exposure is low. The probability of infection following exposure depends on a number of factors including the volume and infectiousness of the body fluids and the route of the exposure. The average incidence of anti-HCV seroconversion after accidental percutaneous exposure from a HCV-positive source is estimated at 1.8% (range 0-7%)[20]. The risk of transmission increases significantly if the source has a high viral load. A review of the recent published evidence of HCV transmission following occupational exposures is summarised in Table 7.

A case control study on the risk factors for HCV transmission in HCW based on UK data collected from 1997 to 2007, found that all HCV seroconversions followed percutaneous injuries[21]. As had been previously shown[22], the depth of injury was significantly associated with seroconversion and the majority of exposures involved hollow bore needles from a vein or artery contaminated with blood or blood stained fluid. Transmission rarely occurs from mucous membrane exposures to infective blood and there are only two published reports to date of HCV transmission to a HCW via non-intact skin exposure[23,24].

Post exposure prophylaxis (PEP)

Currently, there is no vaccination or post exposure prophylaxis that is effective in the prevention of hepatitis C transmission. However, treatment of acute hepatitis C infection is now highly effective. Early identification of infection is necessary to enable prompt referral and treatment.

Table 7: Evidence of HCV transmission following occupational exposures

Country	Time period	Number of exposures involving HCW and HCV positive source	Number of HCV seroconversions	Rate
Australia[6]	2000-2003	64 #	0	0%
Austria[21]	1995-2009	150*	0	0%
Brazil[7]	1997-2009	38#	2	5%
Denmark[22]	2003-2012	62	0	0%
Germany[9]	2010-2012	44*	1	2.3%
Italy[23]	2004-2006	26	0	0%
Korea[24]	2004 -2008	327	3	0.9%
Netherlands[10]	2003-2010	53	1	1.9%
United Kingdom[12]	2004-2013	2566	9	0.4%

*All percutaneous injuries with source known to be HCV PCR positive
#All percutaneous injuries involving large bore catheter needles

Source testing recommendations

If the source is known or found to be HCV antibody positive, then quantitative hepatitis C RNA testing of the source patient should be performed with the consent of the source, so that the exposed HCW can be counselled appropriately about the risk of transmission.

Exposed HCW testing recommendations

The exposed HCW should undergo qualitative HCV PCR testing at 6 weeks and HCV antibody testing at 6 weeks and 12 weeks. If results are negative at that time the HCW can be advised that the risk of transmission is negligible but an antibody test at 24 weeks post exposure should still be undertaken to confirm that transmission has not occurred. Given its low specificity, liver function testing is not recommended. In the rare event that an exposed HCW is newly diagnosed with HCV infection, the local PHU should be notified.

Advice for the exposed HCW during follow up period

During the follow up period the exposed HCW should be advised:

- not to donate plasma, blood, body tissue or sperm
- to seek medical attention if they develop signs and/or symptoms of acute hepatitis (i.e. anorexia, vague abdominal discomfort, nausea and vomiting, fatigue and/or jaundice)

The exposed HCW is not required to modify sexual practices. In most circumstances the HCW should refrain from becoming pregnant until HCV infection is excluded. There are no restrictions regarding breastfeeding. Modifications to work practices (including avoidance of exposure prone procedures) are not required on the basis of an occupational HCV exposure.

Testing of the exposed HCW

The exposed HCW should have baseline testing for HIV, HBV and HCV infections as detailed in Table 8. If the exposed HCW is known to be infected with one or more of these BBVs, then baseline testing for those BBVs is not required. Note that a HCW with previous HCV infection who has been successfully treated or who has cleared the virus spontaneously remains susceptible to HCV re-infection.

Informed consent must be obtained before testing can proceed. The exposed HCW needs to be informed that baseline testing:

- Determines whether they were infected before the exposure and can be done up to a few days after the exposure (there is no need for after-hours testing)
- Does not have to be done at the workplace. The HCW can seek testing at their GP or other offsite service but the reason for the test (i.e. following occupational exposure) should be documented.
- Although not urgent, is important in case of a worker's compensation claim in the rare event of seroconversion

If the HCW is not immune and not previously vaccinated against HBV, or not currently infected with HBV, then he/she should be vaccinated as outlined in The Australian Immunisation Handbook and in accordance with the current NSW Policy Directive *Occupational assessment, screening and vaccination against specified infectious diseases*.

The HCW should be offered immediate referral to a specialist service if a previously undiagnosed blood borne virus is detected. Refer to current version of the NSW Policy Directive *HIV, Hepatitis B or Hepatitis C – Health Care Workers Infected*. Immediate consultation with a HIV specialist is required in the event that the exposed HCW who had commenced HIV PEP is found to be HIV positive on baseline testing.

All occupational exposure incidents should be documented according to local procedures.

Table 8: Baseline testing of the HCW

HCW hepatitis B status unknown	HCW previously shown to be hepatitis B immune
• Hepatitis B surface antigen, hepatitis B surface antibody, hepatitis B core antibody • Combined HIV antigen and antibody immunoassay (fourth generation HIV test) • Hepatitis C antibody	• Combined HIV antigen and antibody immunoassay (fourth generation HIV test) • Hepatitis C antibody

Special situation: when a patient is exposed to the blood or body fluids of a HCW

In some instances, when a HCW is exposed to potentially infectious fluids from a patient, there is also exposure of the patient to the HCW's blood. For example, this might occur if the HCW experiences a used sharps injury and blood from the sharps injury comes into contact with the patient's open wound or mucous membrane. In this situation, in addition to the risk of BBV transmission to the HCW, there is also a potential risk of BBV transmission from the HCW to the patient. In such circumstances, the HCW should be managed as per Sections 2 to 5 as a potential source for the patient. The patient and their treating medical team must be informed of the incident as soon as possible after the exposure. Injuries to patients must be reported in the Incident Information Management System.

The Australian National Guidelines for the Management of Health Care Workers Known to be infected with Blood Borne Viruses minimize the risk that a patient will be exposed to the blood of an infected health care worker. In the event of an occupational exposure incident involving a HCW known to be infected with a BBV, refer to the NSW Policy Directive, *HIV, Hepatitis B or Hepatitis C – Health Care Workers Infected*.

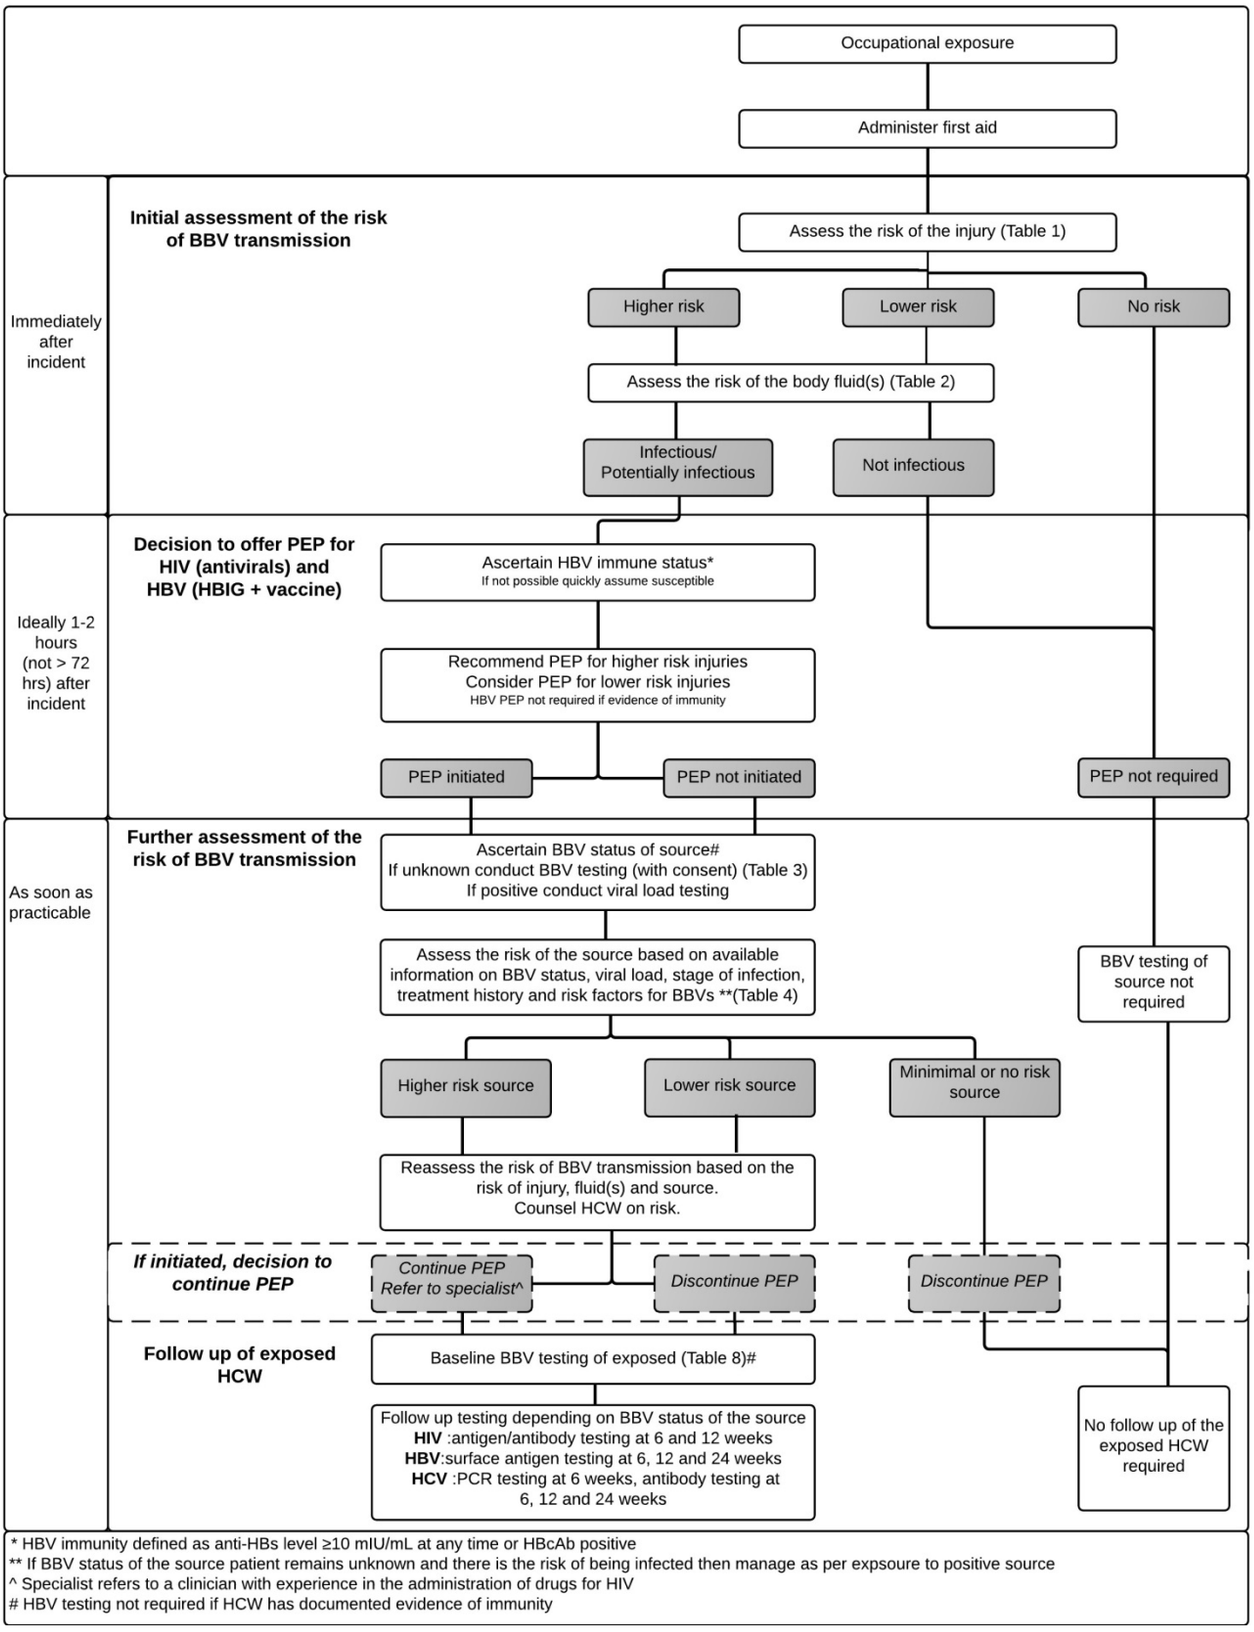
APPENDIX A: MANAGEMENT OF THE EXPOSED HCW FOLLOWING AN OCCUPATIONAL EXPOSURE



* HBV immunity defined as anti-HBs level ≥10 mIU/mL at any time or HBcAb positive
** If BBV status of the source patient remains unknown and there is the risk of being infected then manage as per expsoure to positive source
^ Specialist refers to a clinician with experience in the administration of drugs for HIV
# HBV testing not required if HCW has documented evidence of immunity

APPENDIX B: RECOMMENDED LABORATORY TESTING FOR THE EXPOSED HCW

BBV status of the source patient[#]	Time (in weeks) following BBV exposure		
	6 weeks	12 weeks	24 weeks
HIV positive	Combined HIV antigen and antibody (fourth generation HIV immunoassay)	Combined HIV antigen and antibody (fourth generation HIV immunoassay)	
HBV positive*	Hepatitis B surface antigen	Hepatitis B surface antigen	Hepatitis B surface antigen
HCV positive	Hepatitis C antibody, qualitative HCV PCR	Hepatitis C antibody	Hepatitis C antibody

[#] If BBV testing of the source patient at the time of the incident is negative but there is the possibility of being in the window period or BBV status of the source is unknown and there is a risk of being infected then follow up as per positive source.

* If the HCW is immune (i.e. anti-HBs level ≥10 mIU/mL or HBcAb positive) no further HBV testing is required regardless of the exposure or status of the source patient.

APPENDIX C: HIV PEP RECOMMENDATIONS

HIV PEP starter packs may very between facilities. The Australasian Society for HIV Medicine *(ASHM*) recommendations are provided here.

Recommendations for PEP following occupational exposure to HIV1

2-drug regimens*
Tenofovir 300mg with lamivudine 300mg (daily) *(TGA approved generic lamivudine may be used to reduce cost) OR Tenofovir disoproxil fumarate/emtricitabine 300mg/200mg (daily)

*Zidovudine, in combination with lamivudine, can be used in two-drug PEP combinations. The benefits of cheaper zidovudine cost are offset by the need for a twice-daily treatment regimen, higher incidences of gastrointestinal side effects, myalgia and headaches in comparison to the recommended regimens.

3-drug regimens
The preferred 2 drug-regimen PLUS dolutegravir 50mg (daily) OR raltegravir 400mg (bd) OR rilpivirine 25mg (daily with food)

Note: Refer to *Post Exposure Prophylaxis after Non-Occupational and Occupational Exposures: Australian National Guidelines 2nd Edition* for cautions in relation to specific antiretroviral medications

APPENDIX D HEPATITIS B PEP RECOMMENDATIONS

Management of non-immune HCWs following occupational exposure to a positive/likely positive HBsAg source2

Type of exposure	**Hepatitis B Immunoglobulin**	**Vaccine**
Percutaneous, ocular or mucous membrane	Single dose of 400IU by IM injection within 72 hours of exposure	1ml recombinant antigen by IM injection within 7 days* of exposure, repeated at 1 month and again 6 months post first dose

*The 1st dose can be given at the same time as HBIG, but should be administered at a separate site. Administration as soon as possible after exposure is preferred.

2 Taken from the Australian Immunisation Handbook, 10th Edition

MANAGEMENT OF HEALTH CARE WORKERS WITH A BLOOD BORNE VIRUS AND THOSE DOINGPERFORM EXPOSURE PRONE PROCEDURES

(PD2019_026)

PD2019_026 rescinds PD2005_162

PURPOSE

This Policy Directive prescribes how the *Australian national guidelines for the management of healthcare workers living with blood borne viruses and healthcare workers who perform exposure prone procedures at risk of exposure to blood borne viruses 2018* (the National Guidelines) are to be implemented within NSW Health Organisations and Affiliated Health Organisations.

The objective of implementation of the National Guidelines is to ensure: patients are protected from acquiring a blood borne virus infection from a health care worker (HCW) during an exposure prone procedure (EPP); and, in the event that a HCW with a blood borne virus (BBV) infection may have exposed a patient to a BBV during an EPP, that patient notification and lookback are based on expert advice.

Adherence to this Policy will assist to fulfil the requirements of NSW Health under the National Guidelines.

MANDATORY REQUIREMENTS

All NSW Health local health districts and networks are required to implement this Policy Directive.

Local health districts and networks must establish an incident management team to undertake a risk assessment in all instances where a HCW with a blood borne virus has performed EPPs outside the criteria in the National Guidelines. Where the risk assessment suggests a potential risk of BBV transmission the incident must be referred to the NSW Health Blood Borne Viruses Advisory Panel (BBVAP). Where the HCW is knowingly non-compliant with the National Guidelines, then must be reported to the Australian Health Practitioner Regulation Agency (AHPRA) (section 2.1).

Health care facilities must specify a person to whom a HCW who performs EPPs should notify in the event that the HCW is diagnosed with a BBV infection. Health care facilities must protect the confidentiality and privacy of HCWs with a BBV infection, and support these HCWs in the workplace setting (section 2.2).

Local health district public health units must on receipt of a notification of a HCW who has performed EPPs while infectious with a BBV, provide this information to the designated person in the health facility in which the HCW works. Public health units must complete a risk assessment on any reports of a newly acquired BBV in an individual with a history of an EPP and no known risk factors for infection acquisition, and refer any cases where there is a potential risk of BBV transmission to the BBVAP (section 2.3).

HCWs must be aware whether procedures they perform are classified as exposure prone (section 2.4).

HCWs who perform EPPs are required to comply with the National Guidelines for BBV testing and annual declaration of compliance to AHPRA (section 2.5).

HCWs who are newly diagnosed with a BBV and who perform EPPs must cease EPPs immediately and inform the person identified in their health care facility. HCWs infected with a BBV who perform EPPs must comply with the National Guidelines in order to return to EPP work and must remain compliant when performing EPPs. They must immediately report all incidents of patient exposure to their blood to the identified person in their health facility (section 2.6).

Student HCWs in a discipline that undertakes EPPs must undergo BBV testing within 12 months prior to commencement of study. They must submit a form declaring that they have undergone BBV testing and meet the requirements of this policy directive to NSW Health before their first clinical placement, and notify the person identified in the health facility when newly diagnosed with a BBV if EPPs are to be undertaken during the placement (section 2.9).

IMPLEMENTATION

Health facilities are responsible for promoting awareness of the National Guidelines amongst their employees who perform EPPs.

Section 2 describes the responsibilities of NSW Health employers and HCWs employed in the implementation of the National Guidelines within NSW Health and in the investigation and follow up of incidents where the public may have been put at risk of BBV acquisition via an infected HCW.

Responsibilities under the National Guidelines apply to clinicians who diagnose and/or manage a HCW with a BBV infection, irrespective of whether they work for NSW Health or in the private sector. These include reporting to NSW Health where there is a potential public health risk that has not been reported to NSW Health by the infected HCW.

Management of health care workers with a blood borne virus and those doing exposure prone procedures

1 BACKGROUND

About this document

NSW Health has a duty of care to provide a workplace environment that is as safe as possible for both patients and health care workers (HCWs) by eliminating health and safety risks so far as is reasonably practicable, and if it is not reasonably practicable to do so, to minimise those risks.

Adherence to standard precautions as outlined in the current NSW *Health Infection Prevention and Control Policy* ensures that the majority of procedures in health care settings pose minimal risk of transmission of a blood borne virus (BBV) from an infected health care worker to a patient. However, while the risk is very low, there are certain procedures during which it is possible for human immunodeficiency virus (HIV), hepatitis B and/or hepatitis C to be transmitted to a patient. Such procedures are referred to as exposure prone procedures (EPPs). During EPPs it is possible that an injury to the HCW could unknowingly result in the worker's blood contaminating the patient's open tissues.

Conversely, when performing EPPs, HCWs are also at risk of being exposed to the blood of patients and so may unknowingly acquire a BBV from an infected patient. NSW Health Policy Directive PD2017_010 *HIV, Hepatitis B and Hepatitis C – Management of Health Care Workers Potentially Exposed* assists health services to appropriately assess and manage a HCW following a known occupational exposure in order to prevent BBV acquisition.

The *Australian national guidelines for the management of healthcare workers living with blood borne viruses and healthcare workers who perform exposure prone procedures at risk of exposure to blood borne viruses 2018* (the National Guidelines) were developed by the Communicable Diseases Network of Australia and endorsed by the Australian Health Ministers' Advisory Council in June 2018.

Registered HCWs in professions which perform EPPs must declare whether they are complying with the National Guidelines at the time of their health practitioner registration and annually at registration renewal, including that they are compliant with the testing requirements in the National Guidelines.

NSW Health policy is to follow the National Guidelines, and this Policy Directive outlines the implementation of the National Guidelines within NSW Health services. It should be read in conjunction with the National Guidelines.

Key definitions

Must - indicates a mandatory action that must be complied with.

Should - indicates a recommended action that should be followed unless there are sound reasons for taking a different course of action.

Healthcare worker - persons, including students and voluntary workers who undertake procedures in public and/or private healthcare settings that normally involve patient care and/or contact with blood or other body fluids.

Infected healthcare worker - a HCW with a confirmed infection of one or more BBV

Blood borne virus – refers to HIV, hepatitis B and hepatitis C viruses.

Student – refers to a person enrolled at a university or other educational institution

Exposure prone procedures – are procedures where there is a risk of injury to the HCW resulting in exposure of the patient's open tissues to the blood of the HCW. These procedures include those where the HCW's hands (whether gloved or not) may be in contact with sharp instruments, needle tips or sharp tissues (spicules of bone or teeth) inside a patient's open body cavity, wound or confined anatomical space where the hands or fingertips may not be completely visible at all times. Examples of EPPs are at Appendix 1 of the National Guidelines and included in Appendix 3 of this document.

Blood Borne Virus Advisory Panel - NSW Health Blood Borne Viruses Advisory Panel provides expert advice to the NSW Chief Health Officer on the assessment of potential public health risks related to transmission of blood borne viruses.

Legal and legislative framework

Health services have a duty of care to their patients and obligations under the *Work Health & Safety Act 2011* (NSW), the *Public Health Act* 2010 (NSW) and their associated regulations and the *Health Records and Information Privacy Act* 2002 (HRIP Act). Consideration must be also given to the requirements of Part 4A of the *Anti-Discrimination Act 1977 (NSW)* which deals with discrimination on the ground of disability and the *Disability Discrimination Act 1992* (Cth).

Registered medical practitioners have a responsibility to protect public health by complying with the Medical Board of Australia's *Guidelines for Mandatory Notifications* and *Good Medical Practice: A Code of Conduct for Doctors in Australia*.

REQUIREMENTS UNDER THIS POLICY DIRECTIVE

The following sections describe the obligations for individuals and the procedures to be followed by health facilities, medical practitioners and educational institutions in fulfilling the requirements of this Policy Directive.

2.1 Local Health District Directors of Clinical Governance

Response when an infected HCW has performed EPPs outside the criteria for the specific BBV regarding care, treatment, monitoring and viral load as stipulated in the National Guidelines

The Director of Clinical Governance must:

- Establish an incident management team to collect relevant information and undertake a preliminary assessment of any risk of BBV transmission to patients. The team should include:
  - the head of infection prevention and control unit at the health facility;
  - the local public health unit;
  - the designated person from the health facility (refer to 2.2 below;)
  - a clinician with expertise in the relevant area; and
  - other members as appropriate (e.g. Staff Health, laboratory staff, other clinicians).
- Refer, via the public health unit, to the NSW Health Blood Borne Viruses Advisory Panel (BBVAP) any incident where the preliminary risk assessment suggests a potential risk of

BBV transmission in the health care setting

- Ensure any instances where a HCW has been diagnosed with a BBV and is non-compliant with the National Guidelines are reported to the Australian Health Practitioner Regulatory Authority (AHPRA) as this is placing the public at risk of substantial harm and therefore meets the criteria for mandatory reporting under the National Law (for further information see the Mandatory notifications guidelines for registered health practitioners 2014).

2.2 Health facilities

Management of an infected HCW

The health facility must:

- Promote awareness of the National Guidelines amongst their employees who perform EPPs (for example at orientation and infection control training).
- For students in disciplines that undertakes EPPs, verify each student's declaration form (Attachment 1) indicating that they are aware of and comply with the requirements of this PD and enter the information into ClinConnect1.
- Ensure that confidentiality of an infected HCW's BBV status is maintained as far as possible, even if the HCW has died or ceased practice.
- Ensure the rights of the infected HCW as employees are safeguarded.
- Ensure infected HCWs have access to appropriate expert medical advice as required (noting that some HCWs will seek expert medical advice outside NSW Health).
- Support an infected HCW to return to work in accordance with the NSW Policy Directive *Injury Management and Return to Work* (PD 2013_006) and the current Public Service Commission's document Procedures for Managing Non-Work Related Injuries or Health Conditions.
- Provide an environment in which HCWs living with a BBV know their privacy and confidentiality will be respected and maintained.

Response when a HCW has performed EPPs outside the criteria in the National Guidelines

The health facility must have local procedures in place to be followed in the event that a HCW who performs EPPs is newly diagnosed with a blood borne virus (BBV), or if a HCW with a BBV inadvertently exposes a person to their blood or performs EPPs outside the criteria in the National Guidelines. These procedures must:

- Specify who the HCW should notify (the designated person); this person should have an understanding of the principles underpinning this policy directive including confidentiality requirements, and have the authority to relieve the HCW of their EPP duties and appoint another HCW to fulfil these duties without breaching the HCW's confidentiality (e.g. Director of Medical Services or Director of Nursing).
- Direct that the incident be reported in a de-identified manner to the local health district Director of Clinical Governance.
- Direct that the incident be notified in a de-identified manner on the Incident Information Management System (IIMS).
- Indicate that the local health district, via the local public health unit, will liaise with Health Protection NSW and refer the incident in a de-identified manner to the Blood Borne Virus Advisory Panel (BBVAP) to seek advice on the need for patient notification and testing as appropriate.
- Ensure a system is in place for urgent BBV viral load testing of HCWs, if required, in the event of an incident in which another person is exposed to the blood/bodily fluids of an infected HCW (noting the facility may not be aware of the HCW's infection until such an

1 ClinConnect is a web-based application built to assist Districts Health Services (Local Health and Specialty Health Networks) and Education Providers manage all clinical placements in NSW Health facilities. It is used to book and manage placements in Nursing & Midwifery, Allied Health and Dental & Oral Health and used to record clinical placement activity for Medicine.

incident occurs and the HCW discloses their status).

Health facilities must also:

- Report, via the designated person, any instances where an infected HCW is knowingly non-compliant with the National Guidelines to the Australian Health Practitioner Regulatory Authority (AHPRA).
- Ensure that the confidentiality of the infected HCW is protected as far as possible.

2.3 Local Public Health Units must:

Response when a HCW has performed EPPs outside the criteria in the National Guidelines

On report that a HCW who performs EPPs is newly diagnosed with a BBV, or if a HCW with a BBV inadvertently exposes a person to their blood, or performs EPPs outside the criteria in the National Guidelines, the local public health unit must:

- Participate in the local health district incident management team to collect relevant information and undertake an initial assessment of the risk of BBV transmission to patients.
- In collaboration with Health Protection NSW, complete a detailed risk assessment on any reports of a newly acquired hepatitis B, hepatitis C or HIV infection in an individual with a history of an EPP and no known risk factors for infection acquisition.
- Refer via HPNSW to the BBVAP for advice on management of situations in which a preliminary assessment indicates a potential risk of BBV transmission in the health care setting.
- Receive and refer, as appropriate, reports where an infected HCW is knowingly non-compliant with the National Guidelines to the BBVAP for advice on the need for patient lookback.
- On receipt of a notification of a HCW who has performed EPPs while infectious with a BBV which indicates a serious threat to public health, and subject to s56 of the *Public Health Act 2010*, provide this information to the designated person (refer section 2.2) in the health facility in which the HCW works1.

2.4 Health care workers

Management of an infected HCW

All HCWs:

- Must be aware if any procedure that forms part of their (current or known future) duties is classified as an exposure prone procedure (EPP) according to the guidance in the National Guidelines.
- Should be aware of their BBV status, and if they have non-occupational risk factors associated with the acquisition of BBVs, they should have regular BBV testing2 according to standard guidelines (refer to national testing policies for HIV, hepatitis C virus (HCV) and hepatitis B virus (HBV)).
- If infected with a BBV and compliant with treatment and monitoring set out in the National Guidelines, may continue to provide clinical care to patients and are not required to disclose their status if their work does not involve EPPs except in the very unlikely event that a patient is exposed to the HCW's blood/bodily fluids.

1 Disclosure by an organisation of information that a HCW who has performed EPPs while infectious is permitted under the *Health Records and Information Privacy Act 2002* if disclosure is reasonably believed to be necessary to lessen or prevent a serious threat to public health or safety. In the case of HIV infection, disclosure of the identity of the HCW can only be made to the Secretary under section 56(4)(c) of the *Public Health Act 2010* (on the basis that failure to disclose the information about a HCW with HIV and un-suppressed viral load who undertakes EPPs is likely a risk to public health).

2 All laboratory testing referred to in this policy are to be conducted in a NATA/RCPA accredited laboratory

2.5 Health care workers who perform EPPs

Management of an infected HCW

HCWs who perform EPPs must:

- Be familiar with the National Guidelines.
- Take reasonable steps to know their BBV status and undergo testing for HIV, HCV and HBV at least once every three years as set out in the National Guidelines.
- Make a declaration to the Australian Health Practitioner Regulation Agency (AHPRA) at the time of annual registration renewal, stating that they are compliant with the National Guidelines.

2.6 Health care workers infected with HIV, hepatitis B and/or hepatitis C who perform EPPs

Response when a HCW has performed EPPs outside the criteria in the National Guidelines

HCWs infected with HIV, hepatitis B and/or hepatitis C who perform EPPs must:

- Cease performing EPPs immediately and inform the person identified in their health facility local procedures if they are newly diagnosed with a BBV
- Seek ongoing care from an appropriately skilled medical practitioner (see section 2.8).
- Meet the criteria for viral suppression outlined in the National Guidelines for initial clearance to perform EPP.
- If cleared for EPP work by their treating medical practitioner, meet the ongoing health monitoring requirements described in the National Guidelines in order to continue EPP work.
- Make a declaration to the Australian Health Practitioner Regulation Agency (AHPRA) at the time of annual registration renewal that they are compliant with the National Guidelines.
- Seek medical advice if they experience a change in health condition which may affect their ability to practice.
- Immediately report all incidents to the designated (refer section 2.2) person in their health facility where he/she is aware of accidentally exposing a patient to their blood or bodily fluids, regardless of the risk of transmission.

2.7 Clinicians who conduct BBV testing for health care workers

The diagnosing clinician must:

- Refer a HCW who performs EPPs who is newly diagnosed with a BBV to an appropriate treating medical practitioner (see section 2.8).
- Counsel the infected HCW to notify the designated person (refer section 2.2) in their workplace, as required by the National Guidelines, if it is possible that he/she performed any EPPs while infectious.

In the event that the diagnosing clinician is aware that the HCW does not notify their workplace that it is possible that the HCW performed EPPs while infectious and there is a serious threat to public health or safety the diagnosing clinician must notify the local public health unit1.

1 Disclosure by an organisation of information that a HCW who has performed EPPs while infectious is permitted under the *Health Records and Information Privacy Act 2002* if disclosure is reasonably believed to be necessary to lessen or prevent a serious threat to public health or safety. In the case of HIV infection, disclosure of the identity of the HCW can only be made to the Secretary under section 56(4)(c) of the *Public Health Act 2010* (on the basis that failure to disclose the information about a HCW with HIV and un-suppressed viral load who undertakes EPPs is likely a risk to public health).

2.8 Medical practitioners who provide expert clinical care to BBV infected health care workers and student HCWs who perform EPPs

The treating doctor for the infected HCW who performs EPPs must:

- Be familiar with the National Guidelines and aware of the requirements and necessary skill sets of treating medical practitioners set out in the National Guidelines.
- Provide formal advice to the HCW regarding personal care, health monitoring and work practices (including initial and ongoing clearance to perform EPPs).
- Ensure a HCW who is newly diagnosed with a BBV receives counselling regarding potential impacts on future career (advice may be sought from the relevant professional college as needed).
- Encourage BBV infected HCWs who perform EPPs to notify the health service of their BBV status.
- Ensure that the HCW has scheduled appointments of appropriate frequency to meet the required level of monitoring and actively follow up missed appointments.
- Report concerns regarding HCW compliance with professional standards and/or breaches in compliance with the National Guidelines to AHPRA, as appropriate.
- Ensure that concerns regarding actual or potential exposures constituting a serious public health risk are reported to the local public health unit in a timely manner to enable a risk assessment of BBV risk to patients to be undertaken.[5]

2.9 Student health care workers in a discipline that undertakes EPPs

Disciplines that may undertake EPPs include: medicine; midwifery; paramedicine; dentistry and oral health.

Student HCWs of a discipline that undertakes EPPs must:

- Undergo testing for BBVs at commencement of study or within the 12 months prior to commencement.
- Follow the same BBV testing requirements as health care workers who perform EPPs (refer to Section 3).
- Submit a form (Attachment 1) declaring that they have undergone BBV testing and meet the requirements of this Policy Directive to NSW Health as part of the verification process before their first clinical placement.
- Ensure they undergo regular testing as outlined in this Policy Directive and submit further declaration forms to NSW Health, via their education provider's partner local health district
- Notify the person identified in the health facility local procedures when newly diagnosed with a BBV if EPPs are to be undertaken during the placement.

The educational institution for students of a discipline that undertakes EPPs must:

- Inform all students of the requirements of this Policy Directive
- Ensure that all students in the relevant disciplines are aware of the requirement to undergo BBV testing and complete a form declaring that they have undergone BBV testing and meet the requirements of the Policy Directive.
- Inform students of the process to have their declaration form verified by NSW Health
- Inform students that those who are non-compliant will not be able to attend clinical placements

MANAGEMENT OF HCWs

BBV testing for health care workers who perform EPPs

HCW who perform EPPs must take reasonable steps to know their BBV status and should be tested for BBVs at least once every three years as outlined in the National Guidelines.

It is the responsibility of the HCW to arrange BBV testing. Following the demonstration of immunity to hepatitis B, further HBV testing is not required.

HCWs who are classified as hepatitis B vaccine non-responders can continue to perform EPPs but must be retested in accordance with the National Guidelines and should seek advice following an occupational exposure to the blood/bodily fluids of a patient.

HCW who perform EPPs must make a declaration to AHPRA when applying for renewal of registration that they are complying with, and have been tested in accordance with the National Guidelines. The results of BBV testing will not be declared to, or recorded by, AHPRA.

The procedures that health services should follow to prevent disease transmission following an occupational exposure to a BBV are outlined in the NSW Policy Directive *HIV, Hepatitis B and Hepatitis C—Management of Health Care Workers Potentially Exposed*.

Health care workers infected with BBVs who perform EPPs

HCWs who are infected with BBVs are permitted to perform EPP work providing he/she:

1. Is under the care of an expert in the treatment of their BBV who also has an understanding of the regulatory framework for HCWs infected with BBVs, including the National Guidelines and this Policy Directive

   AND

2. Meets the criteria for initial and ongoing health clearance set out for each BBV in the National Guidelines as assessed by the HCW's treating medical practitioner

Clearance to allow an infected HCW to perform EPPs

Initial and ongoing clearance to perform EPP work is provided by the treating medical practitioner to the health care worker if the treating practitioner is satisfied that the criteria are met as stipulated in the National Guidelines. Expert assistance is available from the BBVAP (via the Director Communicable Diseases Branch) if required.

Non-compliance by an infected HCW

In accordance with the mandatory reporting requirements under the National Law and the National Guidelines the treating medical practitioner must notify the HCW to AHPRA if the HCW is putting the public at risk. If required advice can be sought from the local public health unit.

The treating medical practitioner must also inform the local public health unit if a serious risk to public health is suspected so that the public health unit can undertake a risk assessment (refer to Section 4).

Support for an infected HCW

Providing the individual is complying with the National Guidelines there is no requirement for an infected HCW who is permitted to perform EPPs to inform a health facility of their BBV status at the commencement of employment; however this is encouraged to facilitate an immediate response to an incident in which a patient is exposed to their blood or other infected bodily fluid. Note that

disclosure of the HCW's BBV status to relevant health facility/LHD staff is required in the event of such an incident (refer to Section 4).

316(21/06/19)

Should a HCW disclose their BBV status to their health facility, this information must be treated confidentially and appropriate support and advice provided to the HCW as required.

NSW Health services are required to have occupational rehabilitation programs in place consistent with the NSW Directive *Injury Management and Return to Work* (PD2013_006) to manage employees with a work related blood borne virus infection. This includes, where relevant, making every effort to provide alternative suitable employment both within NSW Health, and if that is not possible, external to NSW Health. Where the HCW acquired the BBV infection outside of work, the obligations of all public health facility employers are outlined in the Public Service Commission's document *Procedures for Managing Non-Work Related Injuries or Health Conditions* and includes where relevant the investigation of alternative positions within NSW Health and other agencies.

Should the HCW be required to take time off from their work duties due to their infection, the relevant health profession board and the relevant specialist college can provide support and advice on retraining and supervision on their return to work.

INVESTIGATION AND RESPONSE WHEN A HCW HAS PERFORMED EPPs OUTSIDE THE CRITERIA IN THE NATIONAL GUIDELINES

Newly diagnosed HCW who has performed EPPs

In the event that a HCW who performs EPPs is newly diagnosed with a BBV he/she must stop all EPP work immediately and seek medical care from an appropriately skilled practitioner. At the time of diagnosis, the HCW must notify the designated person (section 2.2) identified in their health facility local procedures if it is possible that they have been performing EPPs while infectious. The relevant professional college can provide advice as to the classification of procedures. If required, the newly diagnosed HCW can discuss the need to inform the health facility/LHD with their diagnosing doctor or the local public health unit.

In the unlikely event that the newly diagnosed HCW has been involved in an incident in the previous 72 hours where it was recognised that another person was exposed to the HCW's bodily fluid, decisions regarding the use of post exposure prophylaxis for HIV and HBV for the exposed person(s) should be made locally based on a risk assessment of the nature of the exposure as outlined in the NSW Policy Directive 2017_010 *HIV, Hepatitis B and Hepatitis C—Management of Health Care Workers Potentially Exposed*.

The health facility, in collaboration with the local public health unit, will collect information regarding the infected HCW (including relevant surgical procedures performed, infection control practices, any known incidents where another person was exposed to the HCW's blood and health monitoring information) in order to make an assessment of the risk of BBV transmission in the health care setting. (Refer to Appendix 1 for guidance.) Where there is the potential for BBV transmission, the public health unit, in conjunction with Health Protection NSW will refer the case in a de-identified manner to the Blood Borne Virus Advisory Panel (BBVAP). The HCW should be informed that their de-identified health and health practice information will be provided to the BBVAP.

The BBVAP will review the risk assessment (refer to Appendix 2 for the terms of reference for the BBVAP). The Chief Health Officer, on advice from the BBVAP, will make decisions regarding the need for a lookback1 investigation to identify any patients who may have acquired a BBV from the HCW. The health facility should ensure that the infected HCW is informed of this process.

1 A lookback is defined as the process of identifying, tracing, recalling, counseling and testing patients or HCW who may have been exposed to an infection in the health care setting in the *NHMRC Australian Guidelines for the Prevention and Control of Infection in Healthcare 2010*.

BBV infected HCWs and lookback exercises

In the event that the Chief Health Officer, following receipt of advice from the BBVAP, requests that a lookback be undertaken, the infected HCW must be counselled by the health facility that relevant patients will be informed about a potential exposure to the blood of a HCW who is infected with a BBV in a non-identifying manner. In accordance with the *NSW Privacy Manual for Health Information*, only staff for whom it is considered necessary in order to carry out their work duties should be aware of the infected HCW's BBV status.

Disclosure of an individual HCW's BBV status to a patient is not necessary and the health facility has an obligation to ensure that confidentiality of an infected HCW's BBV status is maintained as far as possible even if the infected HCW has died, ceased practice or has been identified publicly.

Potential health care associated BBV transmission

All new HIV diagnoses are notified (using a name code) to Health Protection NSW which routinely collects risk factor information from the relevant clinician. Notifications of newly acquired hepatitis B and hepatitis C cases are routinely followed up for risk factor information by the local public health unit. If a patient presents with a newly acquired hepatitis B, hepatitis C or HIV infection after undergoing an EPP, and the origin of the infection is unclear, the local public health unit will complete a detailed risk assessment in conjunction with Health Protection NSW. Referral to the BBVAP for advice as to the appropriate public health action may occur depending on the outcome of the risk assessment.

Management of patients following exposure to blood/bodily fluids of an infected HCW

Infected HCWs who are performing EPPs as permitted within the National Guidelines, are required to report to the designated person (refer section 2.2) in their health facility any incidents in which a patient is known to have been accidentally exposed to their blood or bodily fluids.

In this situation, a detailed risk assessment should be done, in conjunction with the HCW's treating clinician and the local public health unit as outlined in the National Guidelines. This should include assessment of several factors including the most recent viral load of the HCW, the history of the HCW with a BBV including their adherence to treatment, the frequency and magnitude (if any) of fluctuations in their viral load and the presence of factors which might increase the HCW's viral load. If there is concern that the viral load of the HCW could be above the level stipulated in the National Guidelines, the health facility should arrange for the infected HCW to undergo urgent viral load testing. The local public health unit will work with the health facility to collect the information required for a detailed risk assessment and, in conjunction with Health Protection NSW urgently refer the matter to the BBVAP.

In consultation with the HCW's treating doctor, the BBVAP will make an assessment of the risk to the patient(s) based on the criteria outlined in the National Guidelines. Following the risk assessment, the BBVAP will make recommendations to the Chief Health Officer regarding the need for follow up of patient(s).

Where urgent decisions on the need for post exposure prophylaxis for HIV and HBV are required (potential patient exposures within the previous 72 hours), the facility should follow the risk assessment guidance in the NSW Policy Directive PD2017_010 *HIV, Hepatitis B and Hepatitis C, Management of Health Care Workers Potentially Exposed*

APPENDIX 1 Guide for assessing the risk of BBV transmission in the health care setting

When there is evidence that a HBeAg, HBV DNA, HCV PCR or HIV positive HCW has performed exposure prone procedure/s the following steps should be taken to determine if there is a risk of transmission from the infected HCW to others.

It should be noted that there are serious legal, human and financial implications of look-back exercises to identify and test patients on whom the infected health care worker performed invasive procedures. The health facility has an obligation to ensure that confidentiality of an infected HCW's BBV status is maintained as far as possible, even if the HCW has died or ceased practice.

The health facility should work with the local public health unit to collect the information required to determine if there is the potential for BBV transmission in the health care setting. This should be done in cooperation with the infected HCW and in a non-identifying manner.

Information required for a risk assessment includes:

- Relevant health monitoring information (such as viral load).
- The nature and history of the clinical practice of the HCW, including the type of procedural practice.
- Evidence of physical or mental impairment or behavior which could have affected the HCW's standard of practice.
- Evidence of poor infection prevention and control practice by the HCW or at the relevant health care setting during the time the HCW was likely infectious with the BBV (a formal infection control audit may be required).
- Known episodes of high risk exposure to a patient, for example sharps injuries (a review of previously reported occupational exposure incidents may be required) , and
- Any other relevant considerations.

The health facility, together with the local public health unit, will review this information and make an assessment of the potential for BBV transmission. Where there is a risk of transmission, the public health unit will refer the matter to the BBVAP for advice regarding a lookback. The health facility should inform the infected HCW that relevant de-identified information will be shared with the BBVAP for the purposes of determining if a lookback is required. The extent of any lookback will be decided by the BBVAP on a case-by-case basis using a risk-based approach.

APPENDIX 2 NSW Health Blood Borne Viruses Advisory Panel

Role of the Advisory Panel

The role of the NSW Health Blood Borne Viruses Advisory Panel (the Panel) is to provide expert advice to the NSW Chief Health Officer on the assessment of potential public health risks related to transmission of blood borne viruses. Its members come from a range of specialist fields to inform the response to a wide range of blood borne virus transmission health risks.

Purpose

The Panel will provide advice on the current scientific evidence on a range of issues related to the transmission of blood borne viruses and provide analysis of the potential public health risks.

Specifically the panel will:

- Provide advice regarding the implementation of the current version of the *Australian National Guidelines for the Management of Health Care Workers Known to be Infected with Blood-borne Viruses* (the National Guidelines).
- Undertake the function of the Expert Advisory Committee as defined in the National Guidelines, including providing advice on:
    a. the risk to patients; and
    b. the work practices of health care workers infected with a blood borne virus (BBV).
- Provide supplementary specialist occupational advice to physicians of health care workers infected with BBV, occupational physicians and professional bodies.
- Provide advice on the management, including the need for patient notification, of incidents involving:
    a. the investigation of potential BBV transmission in health care settings;
    b. inadequate reprocessing of instruments or equipment used in invasive procedures; and
    c. other incidents in health care settings where patients may have been exposed to a BBV.
- At the request of the Chief Health Officer, provide advice on other issues related to BBV transmission.

Governance

Chair

The Panel Chair is appointed by the NSW Chief Health Officer. The Deputy Chair is the Director of Health Protection NSW.

Code of conduct

Members will be required to agree to and sign a Declaration of Ethical Behaviour upon joining and membership renewal (every 2 years) and adhere to the NSW Health code of conduct as appropriate.

Confidentiality

Members will be required to sign a confidentiality agreement upon joining, and membership renewal (every 2 years). Information provided to members to inform their discussion is provided in confidence and is not to be disclosed to any third party.

Conflicts of interest

Members will be required to declare any potential conflicts of interest (real or perceived) upon joining. In addition conflicts of interest will be addressed as an agenda item at the commencement of each meeting, in light of the issues at hand, and recorded in the meeting minutes.

Decision making

The panel is an advisory body to the NSW Chief Health Officer. The panel will not be a decision making entity.

Membership

Membership will be by invitation of the NSW Chief Health Officer and will be reviewed every 2 years. Membership may include experts from within NSW Health, government agencies, academia, research organisations and industry.

Standing Panel members will include at least one:

- Infectious Diseases Physician
- Director, Health Protection NSW
- Virologist
- Occupational Health Physician
- Infection Control Practitioner
- Ethicist
- Public Health Unit Director
- Director, Communicable Diseases Branch

In addition, the Panel may also include ad hoc members from the following groups:

- A member of the professional group, relevant to the health care worker e.g. RoyalAustralasian College of Surgeons
- A health care worker advocate
- A hepatologist, immunologist or other appropriate medical expert

Nominated experts may be invited by the Chair of the Panel to be supplementary members of the Panel to attend meetings to provide specific advice in their areas of expertise on a needs basis for a period of up to 2 years, in conjunction with Panel membership review. Nominated experts will be asked to self-select a secondary contact for this purpose in the event that they are unable to attend a Panel meeting when required. These nominated members (and their secondary contacts) will be subject to the same code of conduct, confidentiality and conflict of interest requirements as other members.

Meeting frequency

The Panel will meet quarterly. Additional meetings will be arranged on a needs basis as issues arise (often on short notice). In these instances, the Panel may meet by teleconference to discuss specific blood borne virus related health risks or incidents.

Where practicable, advance notification and circulation of meeting papers and agenda will be carried out, however, due to the nature of the Panel and the potential urgency of issues to be addressed, meetings may be required to be carried out with less than 48 hours' notice.

Panel Structure

Where issues outside the scope of expertise of standing members arise, additional experts may be invited to participate in relevant meetings of the Panel.

Proxies

Due to the expertise based nature of the panel, proxies will not be accepted if a member is unable to attend a meeting.

Record of meetings

Minutes of the meetings will be prepared by the secretariat, and endorsed by the Panel Chair, prior to submission to the Chief Health Officer.

Referral of issues to the panel
Issues may be referred to the Panel by representatives of Local Health Districts, or by Health Protection NSW. All referrals are required to be submitted in the format of the pro forma referral brief.

A treating doctor may seek individual advice directly from the BBVAP on case management in relation to any aspect of this policy directive or the National Guidelines.

Remuneration

No sitting fees will be provided.

Secretariat

Secretariat support will be provided by Health Protection NSW via the Communicable Diseases Branch.

Terms of reference

The terms of reference will be reviewed every 2 years.

APPENDIX 3: Definitions and examples of EPPs
Non-exposure prone procedures (non-EPPs) are procedures where the hands and fingers of the HCW are visible and outside of the body at all times and procedures or internal examinations that do not involve possible injury to the HCW's hands by sharp instruments and/or tissues, provided routine infection prevention and control procedures are adhered to at all times.

Examples of non-EPPs include routine oral examination (gloved with mirror and/or tongue depressor); vaginal and rectal examinations (except where there is a possibility of pelvic fractures in trauma); insertion and maintenance of intravenous or central lines; incision of superficial abscesses and incision and drainage of superficial haematomas; percutaneous drainage of abscesses and haematoma under radiation or ultrasound guidance; minor suturing of uncomplicated skin lacerations; risk from handling sharps (such as handling needles and scalpels outside of a patient's body).

Exposure prone procedures (EPPs) are procedures where there is a risk of injury to the HCW resulting in exposure of the patient's open tissues to the blood of the HCW. These procedures include those where the HCW's hands (whether gloved or not) may be in contact with sharp instruments, needle tips or sharp tissues (spicules of bone or teeth) inside a patient's open body cavity, wound or confined anatomical space where the hands or fingertips may not be completely visible at all times. [5, 76].

Examples of EPPs include:

- **Cardiothoracic surgery:** generally all cardiothoracic procedures.
- **Dentistry:** including maxillofacial surgery and oral surgical procedures, including the extraction of teeth (but excluding extraction of highly mobile or exfoliating teeth), periodontal surgical procedures, endodontic surgical procedures, implant surgical procedures.
- **Gynaecological surgery:** including perineal surgery, trans-vaginal surgery, and open abdominal gynaecological surgery.
- **Neurosurgery:** that involves exposure to sharp bone fragments e.g. trauma and some spinal surgery.
- **Obstetric or midwifery procedures:** including caesarean birth, instrumental birth, infiltration of the perineum with local anaesthetic, episiotomy, repair of an episiotomy or perineal/vaginal tear, application of a fetal scalp electrode, and fetal blood sampling.

- **Open surgical procedures:** including open abdominal or thoracic general surgery, open abdominal or thoracic vascular surgery and open urological procedures.
- **Orthopaedic procedures:** including procedures involving the cutting or fixation of bones or the distant transfer of tissues from a second site (such as in a thumb reconstruction), and open surgical procedures where there is the possibility of bone fragments and/or bone spicules, mechanical drilling is involved, or the procedure involves deep tunneling using sharp instruments.
- **Otolaryngology, head and neck surgery:** in particular bony facial reconstructive surgery (elective or after trauma).
- **Plastic surgery:** where it involves extensive cosmetic procedures that involve bony reconstruction or free tissue transfer involving bone or in the thorax.
- **Trauma:** including open head injuries, facial and jaw fracture reductions, extensive soft tissue trauma, rectal examination in the presence of suspected pelvic fracture, deep suturing to arrest haemorrhage and internal cardiac massage.

Examples of procedures that are generally considered to be non-EPP but have the potential to escalate to open or trauma procedures that will require access to a colleague who can perform EPPs include:

- **Minimally invasive procedures:** including laparoscopy, endovascular procedures, thoracoscopic procedures, Natural Orifice Transluminal Endoscopic Surgery (NOTES), cystoscopic procedures, arthroscopic procedures, and robotic surgery.
- **Trauma/emergency situations:** there is the risk in trauma/emergency situations that a previously non-EPP may escalate (and quickly) into an EPP. This context must be considered for paramedics, emergency department staff, and HCWs who work in rural or remote areas.

These lists are intended as a guide only and do not cover all eventualities and must be interpreted with caution. Moreover, it is recognised that variations in practice may exist in Australia, and may change over time. It is therefore recommended that the over-arching EPP definition given is used as the primary guidance when deciding whether a particular practice/procedure is exposure prone or not. The relevant specialist college can provide more detailed information about what procedures are considered exposure prone in their specialities. The relevant specialist colleges may recommend a greater frequency of BBV testing for their speciality, particularly when high risk EPPs are commonly performed, and their contact details are provided in Appendix 2: Roles of the National Guidelines.

Attachment 1: Blood Borne Virus Student Declaration Form
All student health care workers of a discipline* that undertakes exposure prone procedures (EPPs) must complete this document prior to their first clinical placement, and again after repeat testing has been undertaken every three years. Students will only be permitted to attend clinical placements if they have submitted this form.

The educational provider must ensure that all student health care workers of a discipline* that undertakes EPPs have completed this form and submitted it for assessment by NSW Health.

Declaration	Initials
I have read and understand the requirements of the *Australian National Guidelines for the Management of Healthcare Workers Living with Blood Borne Viruses and Healthcare Workers who Perform Exposure Prone Procedures at Risk of Exposure to Blood Borne Viruses* and the NSW Health policy *Management of health care workers infected with HIV, Hepatitis B or Hepatitis C and health care workers who perform exposure prone procedures*.	
Select either A or B ☐ A: I have undergone testing for blood borne viruses** (BBVs) at commencement of study in Australia or within the 12 months prior to commencement. ☐ B: I have undergone a repeat test for BBVs within a three year period from the date of my last test. The date of my test was: _____	
I agree to the following: • be tested for Hepatitis B, Hepatitis C and HIV at least once every three years. • have appropriate and timely testing and follow up care after a potential occupational exposure associated with a risk of BBV acquisition. • have appropriate testing and follow up care after potential non-occupational exposure, with testing frequency related to risk factors for virus transmission. • notify the person identified in the health facility local procedures if I am newly diagnosed with a BBV and will refrain from performing EPPs until a risk management plan has been developed by the NSW Health agency during the placement. • cease performing all EPPs if diagnosed with a BBV until the criteria in the *National Guidelines* are met.	

Declaration: I _____ declare that I comply with the requirements of the *National Guidelines* and that the information provided is correct.

Full name:	*Date of Birth:*	*Student ID:*
Email:	*Education Provider:*	
Date:	*Signature:*	

***Disciplines that undertake exposure prone procedures** include: medicine; midwifery; paramedicine; dentistry and oral health.
****Relevant blood borne viruses** are Human Immunodeficiency Virus (HIV), Hepatitis B and Hepatitis C.

OCCUPATIONAL ASSESSMENT, SCREENING AND VACCINATION AGAINST SPECIFIED INFECTIOUS DISEASES (PD2023_022)

PD2023_022 replaced PD2022_030

POLICY STATEMENT

All NSW Health organisations must establish systems to ensure that all workers are appropriately assessed, screened and vaccinated to reduce the risk associated with vaccine-preventable diseases in accordance with the risk category of their position.

These diseases include SARS-CoV-2 (COVID-19), diphtheria, tetanus and pertussis, hepatitis B, measles, mumps, rubella, varicella, tuberculosis and influenza.

SUMMARY OF POLICY REQUIREMENTS

All workers must be assessed, screened and vaccinated as required by the risk category of their position before they commence employment/ engagement or attend clinical placements in NSW Health facilities.

Each NSW Health agency must ensure that resources and appropriately trained assessors are provided to conduct assessments of compliance.

All workers and new recruits are required to receive 2 doses of a Therapeutic Goods Administration approved or recognised COVID-19 vaccine to commence employment/ engagement or continue to work within a NSW Health service.

A worker and new recruit will be considered compliant if they have a medical contraindication to all available Therapeutic Goods Administration approved or recognised COVID-19 vaccines and provide medical contraindication evidence in line with the policy requirements.

In addition, all Category A workers and new recruits are required to receive one dose of the seasonal influenza vaccine annually to be considered compliant.

Category A workers and new recruits who are non-compliant with seasonal influenza vaccination or have a medical contraindication to influenza or COVID-19 vaccinations must comply with all other infection control risk reduction strategies as directed while working in a Category A position.

Category A workers and new recruits must have completed the Tuberculosis (TB) Assessment Tool and the follow-up required.

For new recruits, compliance with this Policy Directive is at the individual's own cost (except for chest x-ray and/ or TB clinical review where required). Workers employed in existing positions must be informed of the requirements of this Policy Directive and any assessments, screening and vaccinations required to meet compliance must be provided as required at no cost to the worker.

Workers and new recruits who have been granted temporary compliance for hepatitis B or tuberculosis must complete the Undertaking/Declaration Form and comply with the requirements within 6 months for hepatitis B compliance, or, in the case of tuberculosis temporary compliance, attend chest x-ray surveillance and clinical reviews as required by the tuberculosis service/ chest clinic until discharged.

Ongoing compliance includes a diphtheria, pertussis, and tetanus (dTpa) booster every 10 years.

All job advertisements must advise potential applicants of the requirements of this Policy Directive and new and existing position descriptions must include the designated risk category of the position.

All students must be advised of the requirements of this Policy Directive prior to and at enrolment/ commencement of the course.

Compliance details must be recorded in VaxLink or ClinConnect (students and facilitators).

The full version of the Occupational Assessment, Screening and Vaccination against specified Infectious Diseases Policy and Procedures is available at https://www1.health.nsw.gov.au/pds/Pages/doc.aspx?dn=PD2023_022

CREUTZFELD-JAKOB DISEASE RELATED INFORMATION SHARING
(PD2014_041)

PURPOSE

To facilitate patient and public health management of suspect cases of Creutzfeld-Jakob Disease (CJD) in NSW residents, a Deed between the Health Administration Corporation (for NSW Health) and the Florey Institute of Neurosciences and Mental Health (for the Australian National Creutzfeld-Jakob Disease Registry) has been endorsed for mutual sharing of information about suspect CJD cases in NSW.

This Policy Directive describes the information to be disclosed, and the disclosure procedure, for information to be provided from NSW Health to the Australian National Creutzfeld-Jakob Disease Registry.

MANDATORY REQUIREMENTS

NSW Health must notify suspected CJD cases and other variants of prion diseases, including variant CJD (vCJD), to the Australian National Creutzfeldt-Jakob Disease Registry (ANCJDR) for the purposes of national surveillance, exposure investigation, classification of the case, and to inform public health response.

IMPLEMENTATION

As required by the *Public Health Act 2010 (NSW*), doctors, hospitals and laboratories must notify suspected CJD cases and other variants of prion diseases, including variant CJD (vCJD), to the local public health unit, who will then inform the Australian National Creutzfeldt-Jakob Disease Registry (ANCJDR).

If the ANCJDR then requires additional information from a doctor, hospital or laboratory for a suspect CJD case in NSW, this must be provided.

The information to be disclosed, and the disclosure procedures for information to be provided by NSW Health and the Australian National Creutzfeld-Jakob Disease Registry (ANCJDR) are described in the following *CJD Related Information Sharing:Procedures, Section 2*.

1. BACKGROUND

1.1 About this document

Identification of suspect cases of Creutzfeld-Jakob Disease (CJD) is needed by public health to determine risks of transmission and to minimise these risks for public safety through infection control.

To facilitate patient and public health management of suspect cases of CJD in NSW residents, a Deed between NSW Health and the Australian National Creutzfeld-Jakob Disease Registry (ANCJDR) at the Florey Institute of Neurosciences and Mental Health (FNI) has been endorsed for mutual sharing of information about suspect CJD cases in NSW.

Under the *NSW Public Health Act 2010*, doctors, hospitals and laboratories must notify suspected CJD cases and other variants of prion diseases, including variant CJD (vCJD), to Health Protection NSW, who will then inform the ANCJDR for the purposes of national surveillance, exposure investigation, classification of the case, and to inform public health response.

Additional information may be requested by the ANCJDR from a doctor, hospital or laboratory for a suspect CJD case in NSW.

The information to be disclosed, and the disclosure procedures for information to be provided by NSW Health and the Australian National Creutzfeld-Jakob Disease Registry (ANCJDR) are described in *Section 2*.

1.2 Key definitions

Australian National Creutzfeld-Jakob Disease Registry (ANCJDR)	The ANCJDR was established in October 1993 in response to the recognition of four probable Australian human pituitary hormone related CJD deaths. The FNI is responsible for the ANCJDR under the auspices of a contract with the Commonwealth to determine all suspect cases of TSE in Australia.
Creutzfeld-Jakob Disease (CJD)	CJD is a fatal neurological disorder thought to be caused by the accumulation of abnormal proteins known as prions. Prions are transmissible under certain rare circumstances. CJD is part of a group of diseases known as Transmissible Spongiform Encephalopathies (TSEs), and has two main forms - classical (which includes sporadic, familial and iatrogenic cases) and variant CJD.
Authorised clinician	A NSW clinician who is an employee under the *Health Services Act 1997 (NSW).*
CJD Related Information Sharing Deed	The Deed provides the legal framework for sharing information about suspect cases of CJD between NSW Health and the ANCJDR.

1.3 Legal and legislative framework

1.3.1 *CJD Related Information Sharing Deed 2014*

A Deed describing the responsibilities of the Health Administration Corporation (for NSW Health) and the Florey Institute of Neurosciences and Mental Health (FNI) (for the Australian National Creutzfeld-Jakob Disease Registry) for disclosure of information between NSW Health and the ANCJDR, including the confidentiality obligations, return of information and other general aspects of the agreement. The disclosure information and disclosure procedure are described in an attached Schedule.

1.3.2 *Public Health Act 2010 (NSW)*

CJD, including vCJD, is a notifiable disease under the Act.

NSW Health Notifiable Disease Data Security and Confidentiality, PD2012_047

In accordance with this Policy Directive, NSW Health is permitted to release identifying data on the basis that, where available, the patient (or their 'authorised representative') has given explicit written permission for such release of information.

1.3.3 *Health Records and Information Privacy Act 2002 (NSW)*

In accordance with the Health Privacy Principles in the Act, NSW Health will, when reasonable, disclose confidential information to the ANCJDR.

1.3.4 *Health Services Act 1997 (NSW)*

A NSW Health authorised clinician defined as an employee under the Act may directly notify a possible case of CJD to the ANCJDR.

2. DISCLOSURE INFORMATION AND DISCLOSURE PROCEDURE

2.1 Responsibilities

2.1.1 NSW Health

Under the *NSW Public Health Act 2010*, doctors, hospitals and laboratories must notify suspected CJD cases and other variants of prion diseases, including variant CJD (vCJD), to Health Protection NSW, who will then inform the ANCJDR for the purposes of national surveillance, exposure investigation, classification of the case, and to inform public health response.

2.1.2 Florey Institute of Neuroscience and Mental Health (FNI)

The ANCJDR will:

- Undertake exposure investigation and final classification of suspected cases of CJD in order to determine the likely diagnosis, the cause of the disease in each case and if there are any implications for public health. For this purpose, ANCJDR will collect information from patients, with consent if possible, referred to the FNI by NSW Health, from treating clinicians and/or from the 'authorised representative', as necessary. The FNI will collect information about cases or possible cases in accordance with the Privacy Laws.
- Conduct public health surveillance for CJD in NSW residents to monitor trends in the incidence, risk factors and clinical outcomes of CJD and its various forms.
- Notify NSW Health of cases and publish annual summary data about NSW cases.
- Provide advice to individual clinicians about suspect, possible, probable or confirmed cases, recommending investigations or other follow up, including infection control measures, as required.
- Provide advice to NSW clinicians, NSW Health and NSW public health units about public health risks (specifically the risks of transmission of CJD to others) of any individuals referred to the ANCJDR, as required.
- Provide advice to NSW Health in relation to the incidence of CJD on an ongoing basis.

The FNI will not share any information with international bodies for the purpose of research or otherwise without the written permission of NSW Health. Any such information must be appropriately de-identified.

2.2 Disclosure Information

The information to be exchanged between NSW Health and the ANCJDR, including the following personal information, to the extent that this information is available:

<u>General cases</u>

1. Patient name
2. NSW Health unique identifier number eg Medical Record Number
3. Date of birth
4. Residential address at time of notification
5. Hospital at the time of notification
6. Treating doctor name and contact telephone number
7. Issues of concern/relevant public health issues

8. FNI outcome classification
9. Date and cause of death if applicable
10. Officer notifying outcome
11. Details of the patient's relevant medical condition(s), including investigations and relevant medical treatments.

Classical cases

12. History of relevant surgery, particularly neurosurgery or ophthalmic surgery or invasive neurological testing (including stereotactic EEG).
13. History of receipt of corneal transplant, or of receipt of human dura mater graft (particularly 'Lyodura' used in Australia between 1972 and 1987).
14. History of Treatment with cadaver-derived human pituitary hormones (used for treatment of short stature or infertility in Australia between 1967 and 1985).
15. History of receiving or donating blood, other blood products or organs.
16. History of dental or surgical care, renal dialysis, or other medical procedures, tattoos or piercings, or acupuncture.
17. Family history of similar illness.

Variant CJD

18. Screening for variant CJD risk factors including travel history and consumption of foods suspected containing beef or bovine products for any case of suspected or confirmed variant CJD.

2.3 Disclosure Procedure

2.3.1 Information from NSW Health to the ANCJDR

- A NSW Public Health Unit (PHU) will notify the ANCJDR of possible, probable or confirmed cases of CJD and its variant (vCJD) where the PHU is aware that no previous report has been made by the treating clinician.
- A NSW authorised clinician (to the extent that they are an employee under the *Health Services Act 1997* (NSW)) may directly notify a possible case to the ANCJDR.
- Where additional clinical information is required by the ANCJDR to classify a case or undertake the exposure investigation, the clinician or healthcare facility will be directly contacted by the ANCJDR.
- Information included under the Deed can be provided by the treating clinician or healthcare facility under the following circumstances:
  - With patient consent
  - With consent from the patient's 'authorised representative' in circumstances where the patient lacks capacity.

The *Health Records and Information Privacy Act 2002* sets out a list of people who can be an authorised representative on behalf of a patient who lacks capacity. This is set out in the Privacy Manual for Health Information (March 2015) as amended from time to time. It includes someone who has an '*enduring* power of attorney' for the individual or is a guardian.

- With consent from the patient's authorised representative or a close relative in circumstances where the patient is deceased. Once a patient has died, the authorised representative will be an executor or administrator of the deceased's estate which endures indefinitely. Powers of attorney and guardianship orders cease on death.

- In circumstances where consent cannot be obtained from the person, or their authorised representative (or is unreasonably delayed), exemptions set out in the *Health Records and Information Privacy Act 2002* (and the Privacy Manual for Health Information (March 2015), as amended from time to time) may be applicable in allowing the release of information under the Deed.

- If the ANCJDR encounters problems in obtaining information for a particular case, they may contact Health Protection NSW to request assistance under the auspices of the Deed.

2.3.2 Information from the ANCJDR to NSW Health

- The ANCJDR will report all notifications of possible NSW cases reported directly to the ANCJDR eg from clinicians, family members, or the CJD support group, or other individuals.
- The ANCJDR will report the final classification of NSW cases to NSW Health.

NSW FRAMEWORK AND STANDARD OPERATING PROCEDURE FOR HIV POINT OF CARE TESTING (GL2019_010)

GL2019_010 rescinds GL2015_018

PURPOSE

This Framework has been developed to guide the delivery of high quality, safe, sustainable and appropriate Point of Care Testing (PoCT) for HIV within NSW Health supported non-laboratory settings in NSW in order to increase uptake of HIV testing among high risk groups, increase the proportion of people who receive their test result, and reduce the number of people with undiagnosed HIV infection.

KEY PRINCIPLES

Point of Care Testing (PoCT) is one pathway to increase testing for HIV, particularly among high risk groups who can experience barriers to testing, including the need to attend a health service to access a test, time taken for test results to be available, poor access to health care providers, stigma and the risk of discrimination. PoCT addresses these barriers through increasing access, supporting autonomy, and providing convenience. PoCT should be offered where possible in conjunction with STI screening and/or conventional HIV testing.

Based on the epidemiology of HIV infection, PoCT for HIV is appropriate for gay men and other men who have sex with men (MSM). PoCT for HIV is generally not appropriate in populations with a low prevalence of undiagnosed HIV infection because of the lower positive predictive value of PoCT in these populations.

Only PoCT devices approved by the Therapeutic Goods Administration (TGA) can be used for HIV testing in Australia. Testing must be conducted in accordance with any product specific conditions placed on the test by the TGA. Information on approved tests and product specific conditions is available from the TGA website www.tga.gov.au.

For a PoCT site to be eligible to operate under the NSW Framework and participate in the NSW Health Quality Assurance and Safety package from the St Vincent's NSW State Reference Laboratory for HIV, it is required to use the NSW Health recommended HIV PoCT device.

A PoCT site that elects to operate outside the NSW Health Framework and the NSW Health Quality Assurance and Safety package would require a strong justification for using an alternative HIV PoCT device to that NSW Health recommended device. In these circumstances, each site should be assessed on a case by case basis and would be required to make a submission to NSW Health outlining the relative benefits of the alternative test with regards to service efficiency, client throughput and test performance for the particular site submitting the application.

USE OF THE GUIDELINE

This Framework is for NSW Health, other NSW Government departments, health professionals, others involved in the delivery of health services and non-government organisations involved in providing HIV related services.

To download the Guideline please go to
https://www1.health.nsw.gov.au/pds/Pages/doc.aspx?dn=GL2019_010

HUMAN IMMUNODEFICIENCY VIRUS (HIV) – MANAGEMENT OF NON-OCCUPATIONAL EXPOSURE (PD2015_005)

PD2015_005 rescinds PD2006_005.

PURPOSE

This Policy Directive outlines the service obligations of Local Health Districts (LHDs) in the management of individuals who have been exposed or suspected to have been exposed to HIV in a non-occupational setting.

Evidence suggests that the timely provision of post-exposure prophylaxis (PEP) following a non-occupational exposure may prevent subsequent HIV infection. Prescribing of PEP must be based on a careful risk assessment of the risk of HIV infection in accordance with the national guidelines *Post Exposure Prophylaxis after Non-Occupational and Occupational Exposure to HIV* published in December 2013 ('National PEP Guidelines').

This Policy Directive should be read in conjunction with National PEP Guidelines, which provide comprehensive clinical guidance on PEP provision.

MANDATORY REQUIREMENTS

LHDs are responsible for the cost of drugs used in PEP, and for ensuring that prescribing is conducted in accordance with the National PEP Guidelines. LHDs must ensure that local PEP services address the time-critical nature of PEP assessment and commencement, and provide prompt referral and follow-up of all patients prescribed PEP.

Compliance with this Policy Directive is mandatory for all health care providers in receipt of funding from NSW Health, including Local Health Districts and Chief Executive Governed Statutory Health Corporations, and Affiliated Health Organisations (both declared and undeclared), and their staff.

IMPLEMENTATION

Chief Executives of LHDs, Statutory Health Corporations and Affiliated Health Organisations in receipt of funding from NSW Health are responsible for ensuring that:

- Local policies and procedures are in place to ensure provision of PEP in accordance with the National PEP Guidelines (Section 2).
- PEP drug provision is funded through the LHD.
- All staff are made aware of their obligations in relation to this Policy Directive; and
- All staff receive appropriate training to enable them to carry out their obligations in relation to this Policy Directive.

All staff must comply with this Policy Directive.

1. BACKGROUND

This Policy Directive specifies the service obligations of Local Health Districts (LHDs) in the provision of Post Exposure Prophylaxis (PEP) for non-occupational HIV exposure. It should be read in conjunction with the national guidelines *Post-Exposure Prophylaxis after Non-Occupational and Occupational exposure to HIV* published in December 2013[1] ('the National PEP Guidelines'), which provide comprehensive clinical guidance.

[1] http://www.ashm.org.au/pep-guidelines

There is evidence in relation to HIV that PEP may prevent infection[1], although there are currently no data from randomised controlled trials of PEP efficacy. The prescribing of PEP must be based on a careful assessment of the risk of HIV infection in accordance with the National PEP Guidelines. PEP should be prescribed as soon as possible after exposure and within 72 hours[2].

Drugs used in PEP are not currently funded through the s100 program. LHDs are responsible for the cost of drugs used in PEP, and for ensuring drugs are prescribed in accordance with the National PEP Guidelines. Treatment prescribed at a patient's first presentation, usually sufficient for one week, is a bridging step until the client is fully assessed by an authorised s100 prescriber or specialist affiliated with a designated HIV/AIDS Unit.

LHDs must ensure that PEP services address the time-critical nature of PEP assessment and commencement, and the need for prompt referral and follow-up of all patients who are prescribed PEP.

The occupational exposure of health care workers to the risk of HIV infection is dealt with in the NSW Health Policy Directive PD2005_311 *HIV, Hepatitis B, and Hepatitis C – Management of Health Care Workers Potentially Exposed.*

2. PROCEDURES FOR MANAGEMENT OF HIV NON-OCCUPATIONAL PEP

2.1 General requirements for Local Health Districts (LHDs)

LHDs are required to have policies and procedures in place that ensure provision of PEP in accordance with the National PEP Guidelines, including:

- Emergency response and assessment of the patient to ensure timely administration of PEP where indicated, as soon as possible after exposure and within 72 hours.
- Access 24 hours-a-day to expert advice and guidance on clinical best practice treatment and management of recent HIV exposure.
- Ready access to drugs used for PEP.
- Information about PEP for the patient.
- Informed consent of the patient.
- Prescribing and dispensing of medication.
- Baseline and follow up testing for HIV.
- Assessment of risk of exposure to other infections, with immunisation, testing and treatment as indicated.
- Provision of, or referral for, follow-up assessment and ongoing monitoring by an authorised s100 prescriber, or specialist affiliated with a designated HIV/AIDS Unit, preferably in the patient's local area.
- Referral to specialist counselling and peer support services where indicated.
- Referral to services that offer ongoing blood borne virus (BBV) and sexually transmissible infection (STI) testing and management, such as publicly funded sexual health services, as patients presenting for PEP are often at a high, ongoing risk for other BBVs and STIs.

2.2 HIV status of the source individual

Attempts should be made to contact the source and ask them to have an urgent HIV test. Where possible obtain information about the source individual including HIV status, and if HIV positive, including viral load, whether on treatment, which treatment, any treatment failures or known resistance.

[1] J Hoy, S Lewin, JJ Post, A Street. HIV Management in Australasia: A Guide for Clinical Care. Australasian Society for HIV Medicine, 2009.
[2] National PEP Guidelines at p.8

Initiation of PEP should not be delayed while establishing the HIV status of the source.

2.3 HIV status of the exposed individual

All candidates for PEP require baseline HIV antibody testing. Where possible, the results should be followed up within 24 hours.
Initiation of PEP should not be delayed while determining the HIV status of the exposed individual.

2.4 Management of possible exposure to other conditions

Hepatitis B
All patients presenting for PEP must be assessed for possible hepatitis B exposure, and tested and provided with immunisation including hepatitis B immunoglobulin where indicated[1].

Other conditions for which testing may be indicated, depending on the nature of the exposure, are listed below: See the National PEP Guidelines for a recommended schedule of baseline and follow-up testing for these conditions in conjunction with PEP assessment[2].

Sexually transmissible infections
Patients are to be tested for chlamydia, gonorrhoea, and syphilis, as indicated by the type of exposure.

Hepatitis C
Patients who are potentially at risk of hepatitis C infection after exposure require follow-up and specialist referral if seroconversion is detected.

Pregnancy
All women who have the potential to be pregnant on presentation for PEP should be offered pregnancy testing. Emergency contraception should be offered to women presenting for PEP who are at risk of pregnancy. Follow-up pregnancy testing should be offered at two weeks post-exposure where indicated. If the test is negative but pregnancy is still suspected, the test should be repeated in 1 week. Specialist advice must be sought urgently for women who require PEP and are pregnant or breastfeeding.

2.5 Recording information where a patient is assessed for PEP

Every assessment for PEP must be documented, regardless of whether PEP is commenced. The required information covers the time of the assessment and first dose (if prescribed), details, including date and time of the exposure, information about the exposed person (including any previous HIV test and result), information about the source, details of PEP discussion with the patient, referral, and follow-up arrangements. Further details are provided in the National PEP Guidelines[3].

2.6 Patient confidentiality

The confidentiality of the patient and the source must be maintained in accordance with the requirements of the *Public Health Act 2010* (NSW).

2.7 Quality assurance

LHDs must have a quality assurance process in place to monitor and review the effectiveness of arrangements for managing exposed individuals, including in relation to health outcomes for patients.

[1] National PEP Guidelines at p.15
[2] At p.8
[3] National PEP Guidelines at p.11

3. APPENDIX

3.1 Contacts and information for health care workers

List of NSW HIV s100 prescribers by suburb: http://www.ashm.org.au/hiv/prescriber-lists
Australasian Society for HIV Medicine
Tel: 02 8204 0700

NSW HIV Support Program
Tel: 02 9391 9195
Email: hivsupportprogram@doh.health.nsw.gov.au
Support for doctors and patients where the patient is newly diagnosed with HIV

Needlestick Hotline
Tel: 1800 804 823
Information and support for healthcare, paramedical, and emergency services workers, who sustain a needlestick injury and/or experience occupational exposure to blood and body fluids

NSW Sexual Health Infolink
Tel: 1800 451 624
TTY: 9221 6515

NSW Sexual Health Clinics
Phone the NSW Sexual Health Infoline for information about clinics and services in your area: 1800 451 624
http://www.health.nsw.gov.au/sexualhealth/pages/sexual-health-clinics.aspx

NSW AIDS Dementia and HIV Psychiatry Service
Tel: 02 9382 8600
http://www.health.nsw.gov.au/adahps/pages/default.aspx

Needle Cleanup Hotline
Arranges clean-up of dumped needles and syringes in public places anywhere in NSW
Tel: 1800 633 353

Community services
ACON
Tel: 1800 063 060
www.acon.org.au
Provides health promotion services specialising in people living with with HIV and lesbian, gay, bisexual, transgender and intersex (LGBTI) health.

NSW PEP Hotline
Tel: 1800 737 669
Information, assessment, and referral of people who may require HIV PEP following a high risk exposure (not an information line for general questions about HIV).
Multicultural HIV and Hepatitis Service
Tel: 02 9515 1234
Free call (NSW country): 1800 108 098
www.mhahs.org.au
A statewide service providing information and assistance for culturally and linguistically diverse communities.

NSW Users and AIDS Association (NUAA)
Tel: 02 8354 7300
Tel (NSW Country): 1800 644 413
http://www.nuaa.org.au/
Provides information and support for users of illicit drugs, and their families and friends, as well as needle and syringe program services.

PozHet
Information Line: 1800 812 404
http://pozhet.org.au/
Provides support for heterosexual people with HIV.

Positive Life NSW
Tel: 02 9206 2177
Free call: 1800 245 677
http://www.positivelife.org.au/
Provides support for people living with HIV.

Sex Workers Outreach Project
Tel: 02 9206 2000
www.swop.org.au
Provides sexual health information and support to people who engage in sex work.

HIV Information Line
Tel: 1800 451 600
Information, support, and referral, about HIV.

TUBERCULOSIS MANAGEMENT OF PEOPLE KNOWINGLY PLACING OTHERS AT RISK OF INFECTION (PD2015_012)

PD2015_012 rescinds PD2005_068.

PURPOSE

This Policy Directive provides a framework for the management of people with tuberculosis (TB) who knowingly place others at risk of infection.

Where persons with TB knowingly risk infecting others, the health system is responsible for taking action to protect the health of the public.

In circumstances where support, counselling and behavioural change techniques fail, the health service may be required to implement restrictive measures under *The Public Health Act 2010*.

MANDATORY REQUIREMENTS

All staff involved in the care of clients with TB must adhere to these principles.

IMPLEMENTATION

Chief Executives must ensure that:
- The principles and requirements of this policy are applied, achieved and sustained.
- Relevant staff are made aware of their obligations in relation to the Policy Directive.
- Documented procedures are in place to support the Policy Directive.

Clinicians:
- Must comply with this Policy Directive.

1. BACKGROUND

1.1 About this document

This Policy Directive provides a framework for the management of people with tuberculosis (TB) who knowingly place others at risk of infection.

The management framework established by this Policy Directive is based on the following principles and assumptions:
- The general public have the right to appropriate protection against the risk of infection.
- A range of factors, including long duration of treatment, medication side effects, perception of stigma and restrictiveness of daily treatment can impact on a person's willingness to accept and comply with TB treatment.
- Social and other health factors, including drug and alcohol dependence, mental health issues, housing concerns and work, family and other responsibilities can also impact on a person's willingness to accept and comply with TB treatment.
- Lessening of the risk of transmitting TB can be brought about by changes in individual behaviour with the help of counselling and education.
- Each person with infectious TB must accept responsibility for preventing the further transmission of the infection.

This Policy Directive explains the framework and process, through which the health system may encourage, facilitate and potentially enforce adherence to TB treatment.

The management of people with TB who knowingly risk infecting others may require intensive, individualised case management, a variety of responses to broader health and social service needs and an escalating series of behavioural management techniques including counselling, behavioural supervision, formal warnings and Public Health Orders, including, if necessary, detention or referral to law enforcement authorities.

1.2 Key definitions

TB is caused by bacteria from the *Mycobacterium tuberculosis* complex. The disease most commonly occurs in the lungs (pulmonary TB), although it can affect any region of the body (extrapulmonary TB). The pulmonary form is most infectious.

1.3 Legal and legislative framework

TB is a Category 4 Scheduled medical condition under the *Public Health Act 2010*. As such it is an offence for a person who has been diagnosed with TB, and is in a public place, to fail to take reasonable precautions against spreading the condition.

The *Act* contains a mechanism to restrict the behaviour of a person who has TB in certain circumstances, using a Public Health Order.

Authorised medical officers under Section 62 of the *Public Health Act 2010* are the Chief Health Officer, or a registered medical practitioner authorised by the Secretary of the NSW Ministry of Health to exercise the functions of an authorised medical practitioner.

2. THE MANAGEMENT FRAMEWORK

The management framework for people with TB who risk infecting others includes the following levels:

Management level	Summary of case management
1. Local management	• The person is managed by the treating clinician and TB service. Expert advice is sought locally as required.
2. Supported management	• The person is managed by the treating clinician and TB service with support from the NSW TB Program Expert Panel.
3. Public Health Order	• The person is managed by the treating clinician and TB service with support from the NSW TB Program Expert Panel. • A Public Health Order is in place which places conditions on the person in relation to their behaviour, treatment, healthcare and supervision.
4. Detention order	• The person is managed by the treating clinician and TB service with support from the NSW TB Program Expert Panel. • The person's movements are restricted by a Public Health Order which includes an order for detention.

Each level is discussed in detail below. Regardless of the level of management it is important that the person's confidentiality is respected and that any communication regarding the person and their management is restricted to those service providers who are directly involved in management of the issues.

2.1 Level 1: Local Management

2.1.1 Initial counselling, education and support

Counselling, education and support is an integral part of the management of all persons with TB, and must be provided from the time of diagnosis. Persons with infectious TB must receive culturally and linguistically appropriate counselling and education to ensure that they understand the public health significance of their diagnosis and the importance of complying with treatment and isolation. A professional interpreter should be used whenever relevant.

The treating clinician and local TB service are responsible for ensuring counselling and education is provided to the person with TB. The treating clinician and TB service should work in partnership with the client, and provide a supportive environment in which there is a mutual trust between the client and the healthcare workers. The person with TB must be given opportunity to voice concerns and ask questions about their treatment.

In the event that a person with infectious TB is non-compliant with recommended anti-tuberculous treatment or isolation requirements in such a way that is endangering, or likely to endanger the health of the public, as a first step the person's understanding of their public health responsibilities should be clarified, and the power of an authorised medical practitioner to make a Public Health Order explained. Intensive counselling and education to support behavioural change should be implemented. This is best undertaken by the treating clinicians and local TB service.

A suitable community organisation may be able to assist with supporting appropriate behaviour by the individual. Their involvement could include social support, and facilitating self-isolation until non-infectious.

Specific incentives and initiatives may include:

- Counselling.
- Provision of housing or supported accommodation.
- Independent living skills training (help with budgeting, life skills).
- Home care support (shopping, cooking, cleaning).
- Emotional support persons (such as a 'buddy' system or peer support group).
- A letter from the public health unit director to the effect that the attending doctor is concerned about compliance with treatment and emphasising the importance of following the doctor's treatment recommendations.

2.1.2 Psychosocial assessment

A person's ability and willingness to comply with TB treatment and isolation may be impacted by a range of factors, including:

- Homelessness, housing and financial concerns.
- Social isolation.
- Alcohol and illicit drug use.
- Mental illness.
- Psychiatric disturbances related to side effects of TB medications.
- Real or perceived stigma.
- Responsibilities and competing priorities, including work, childcare, education.

A full psychosocial assessment of the person is critical at this stage, if it has not already been undertaken. Expert support from a social worker, psychologist or psychiatrist may be required at this stage. The treating clinician and TB service should work with other healthcare teams involved in the person's management, such as drug and alcohol and mental health services, in order to overcome barriers to the person's non-compliance.

2.1.3 Case conference and consultation

A case conference between the treating clinician, local TB service, Public Health Unit, Aboriginal Health Unit or Multicultural Health Service (if applicable) and other local services involved in the care of the person with TB is often useful in addressing specific management issues, as well as developing a comprehensive care plan for that person.

The NSW TB Program Manager, Communicable Diseases Branch and Public Health Unit Director should also be consulted.

2.2 Level 2: Supported Management

In circumstances where counselling and support measures have failed to mitigate concerns that a person presents an imminent public health risk, more assertive management should be initiated. At this level, the NSW TB Program Manager should be consulted to consider the need to convene an expert panel, additional assessment should be undertaken, and other initiatives should be considered.

2.2.1 Seeking input from the NSW TB Program Expert Panel

Where the treating clinician and local TB service are concerned about the compliance of a person with infectious TB after local management has been attempted, they may seek advice from the NSW TB Program Manager regarding the potential to convene an Expert Panel to consider the case. The constitution of the Expert Panel is detailed in section 3 of this policy directive.

The Expert Panel is convened on a needs basis to review the management of challenging and complex cases. The Expert Panel will review the management of the case and provide advice on additional or alternative strategies.

In cases where the Expert Panel is consulted, care and management of the patient remains the responsibility of the treating clinicians and local TB service.

The TB service must provide a monthly report on treatment progress to the NSW TB Program until the person completes treatment or is transferred out of the TB service.

2.2.2 Letter of warning

A formal letter from the Local Health District Public Health Unit Director to the person should be considered at this stage. In some cases a formal letter of warning may be sufficient to improve behaviour.

This letter would act as an official warning to the person to discontinue any activity which may place other people at risk of infection with TB. The letter would include:

- The responsibilities of the client with respect to their diagnosis of TB.
- Expected behaviours of the client and the rationale for these.
- The services available to the person to support them to comply with their TB management .

- The steps that should be taken by the person to satisfactorily comply with their TB management.
- The legal powers available to take action against persons contravening the public health legislation, including the power to make a Public Health Order.

2.3 Level 3: Public Health Order

In extenuating circumstances where other strategies within management levels 1 and 2 have failed, a Public Health Order may be considered.

In the event that a Public Health Order under the *Public Health Act 2010* is considered the appropriate course of action by the Expert Panel, treating clinician, and local Public Health Unit Director, a recommendation is accordingly made to the Chief Health Officer by Health Protection NSW, in consultation with the NSW Ministry of Health Legal and Regulatory Services Branch.

A Public Health Order may require the person subject to the order to do any one or more of the following:

- To refrain from specified conduct.
- To undergo specified treatment.
- To undergo counselling by one or more specified persons or by one or more persons belonging to a specified class of persons.
- To submit to the supervision of one or more specified persons or of one or more persons belonging to a specified class of persons.
- To undergo specified treatment at a specified place.

2.3.1 Making the Public Health Order

The procedures associated with making a Public Health Order are:

- An authorised medical practitioner may make a written Public Health Order in respect of a person if satisfied on reasonable grounds that the person has TB and because of the way the person behaves, the person may, as a consequence of that condition, be a risk to public health. It would be expected that the authorised medical practitioner would be provided with advice from the Expert Panel to assist in this determination.
- In deciding whether to make a Public Health Order, the authorised medical practitioner must take into account:
    - The principle that any restriction on the liberty of a person should only be imposed if it is the most effective way to prevent any risk to public health.
- Unless it is an emergency or it is otherwise not reasonably practicable to do so, in deciding whether to make a Public Health Order in respect to TB, the authorised medical practitioner must also take into account:
    - Whether reasonable attempts have been made to provide the person with information about the effects of the condition the person has and the risks to public health of that condition.
    - The options other than a public health order that are available to deal with the risk to public health posed by the person.
    - If the proposed public health order will require the person to undergo treatment - the availability and effectiveness of the proposed treatment and the likely side effects of the proposed treatment on the person.
    - If the proposed public health order will require the person to be detained - the likely social, economic, physical and psychological effects of the detention on the person.
    - These guidelines.

- Section 66 of the Act allows a person who is subject to a Public Health Order for a category 4 condition to appeal to the Administrative Decisions Tribunal. A person to whom an Order is issued should be informed of their right of appeal and arrangements should be made to ensure that the person has appropriate legal representation in the Tribunal hearing.

2.3.2 Duration of the Public Health Order

A Public Health Order must state that it expires a specified number of days (not exceeding 28 days) after its service on the person, unless the order is earlier varied as to its duration or is earlier revoked. A Public Health Order ceases to have effect if:

- A copy of the application made to the Administrative Decisions Tribunal for confirmation of the order under Section 64 of the *Public Health Act 2010* is not served upon the client within three days of service of the order.
- The Tribunal revokes the order.
- The order expires before it is confirmed or revoked by the Tribunal or before or after an application to continue the order is made to the Tribunal.
- If the authorised medical practitioner considers that the person subject to the order is no longer a risk to public health, the authorised medical practitioner must revoke the order and immediately give notice in writing of the revocation to the person and the Civil and Administrative Tribunal.

2.3.3 Continuation of orders

Before the expiry of the Order, an authorised medical practitioner may apply to the Tribunal for continuation of the order for a period up to six months if the authorised medical practitioner is satisfied that the person subject to the order would continue to be a risk to public health as a consequence of having TB, if not subject to a Public Health Order.

The decision to seek continuation of a Public Health Order should be made in consultation with the NSW TB Program Expert Panel.

2.4 Level 4: Detention order

It must be emphasised that the use of public health detention is expected to be a rare occurrence, and should only ever be considered as a last resort.

All Local Health Districts should identify appropriate facilities and staff who are able to implement an order for secure detention under the *Public Health Act 2010*. See section 4.

Where the person to whom the Public Health Order applies is already detained under a custodial sentence, consideration should be given to the unique circumstances of implementing the Public Health Order, including:

- That client confidentiality, legal and safety issues be considered, and
- That isolation measures may require negotiation with Justice Health, Corrective Services NSW and Juvenile Justice.

3. NSW TB PROGRAM EXPERT PANEL

The role of the NSW TB Program Expert Panel is to provide expert advice to clinicians and to support local decision making in relation to complex and challenging cases of TB, including persons who knowingly risk infecting others. The Expert Panel is convened on an ad-hoc basis, at the request of the treating clinician or local TB Coordinator.

The treating clinician and local TB Coordinator are responsible for presenting the case to the Expert Panel. The Expert Panel reviews the clinical and public health management of the case and recommends additional or alternative management strategies.

The core constitution of the Expert Panel includes:
- Director, Health Protection NSW (Chairperson)
- Director, Communicable Diseases Branch
- Manager, NSW TB Program (Secretariat)
- At least one nominated expert TB physician
- Director, Public Health Unit (of the relevant local health district).

Additional Expert Panel members are selected based on specific needs of the case, and may include:
- Specialist TB nurses
- Additional expert TB physicians
- Aboriginal health worker
- Social worker
- Psychiatrist
- Representative of a refugee health service, or multicultural health worker
- Professional ethicist
- A member of the relevant community or key support group.

The Panel will advise the Chief Health Officer based on consideration of issues identified in section 2.3.1.

4. ACCOMMODATION

4.1 Hospital facilities

Persons with TB may require hospitalisation, either for the purposes of undertaking investigations, establishing a treatment regimen, or to ensure respiratory isolation. Local Health Districts should be prepared to effectively manage persons with TB who may be resistive to treatment and isolation orders.

Local Health Districts must:
- Develop a management plan addressing the needs of the case, other patients, staff and visitors.
- Provide adequate staff training.
- Assure the availability of appropriate secure facilities and processes, including the use of security personnel ('secure' in this context means the minimum additional security to ensure that the person does not injure themselves, or inconvenience staff or other patients).
- Identify a suitable location for accommodating a person with infectious TB who is detained under public health legislation.

People with TB may have concurrent mental illness, which can potentially be exacerbated by isolation and the effect of some TB medications. Local Health Districts should ensure that relevant expertise is available to safely and effectively manage such patients. The use of mental health legislation for detention of recalcitrant persons with TB will never be appropriate or lawful, except in circumstances where their mental health status is serious enough to warrant detention under the *Mental Health Act 2007*.

4.2 Alternative accommodation

When accommodation is required for the primary purpose of respiratory isolation or public health detention in patients who are medically stable, a non-hospital setting may offer the most appropriate environment. Local Health Districts must consider how best to accommodate people with TB in such situations and ensure suitable security arrangements to maintain them in detention.

MASS VACCINATION CLINICS DURING AN INFLUENZA PANDEMIC
(GL2018_008)

PURPOSE
This Guideline is a supporting document to the NSW Health Influenza Pandemic Plan (PD2016_016). It provides Local Health Districts with the framework to develop operational level plans for the establishment of clinics to deliver mass vaccination to the public.

KEY PRINCIPLES
Immunisation with a vaccine specific for the pandemic influenza strain, when available, is likely to be the most effective measure to control the spread of influenza in the community. The implementation of a mass immunisation program is identified as a key strategy of the Australian and NSW Health influenza pandemic plans.

This Guideline:
- provides guidance to NSW Local Health Districts (LHDs) on how to plan for and operate mass vaccination clinics during an influenza pandemic
- is a supporting guideline and should be read in conjunction with the policy directive NSW Health Influenza Pandemic Plan (PD2016_016), and other supporting guidelines including the Pandemic Guideline – Aboriginal Communities
- recognises that the delivery of mass vaccination of the population with pandemic vaccines will require models different to those currently used for routine immunisation programs in NSW
- outlines the scenarios and strategies that LHDs would be expected to plan for in order to establish and operate mass vaccination clinics
- describes the roles and responsibilities of key national, state and regional level stakeholders assisting in the development or distribution of vaccine and operation of vaccination clinics
- provides guidance on the minimum staff and resource requirements for LHDs to be able to operate vaccination clinics in their district
- may be able to be adapted for other infectious disease emergencies where large-scale vaccination clinics are required.

USE OF THE GUIDELINE
LHDs should use the attached Guideline to develop local plans for the establishment and operation of vaccination clinics should these be required during an influenza pandemic. Sections of particular relevance include:
- Vaccine Storage and Dispatch (Section 4)
- Mass Vaccination Clinic Requirements (Section 5)
- Mass Vaccination Clinic Operations (Section 6)

In planning for the establishment of clinics, LHDs need to:
- consider how to identify and deliver vaccine to likely priority groups in their population;
- in rural areas, consider alternative models where necessary for delivery of vaccination to population groups within their district
- monitor vaccine distribution, uptake and adverse events following immunisation;
- ensure that all staff working under the auspices of the LHD have completed the necessary education and training appropriate to their role in a vaccination clinic;
- work with their local primary healthcare organisations to determine if general practice clinics or community health centres could be used to conduct local mass vaccination clinics during the pandemic; and
- work with Aboriginal Community Controlled Health Services (ACCHS) in their district to determine if mass vaccination clinics could be established and operated within the ACCHSs.

The full guidelines can be downloaded at
https://www1.health.nsw.gov.au/pds/Pages/doc.aspx?dn=GL2018_008

NSW CONTINGENCY PLAN FOR VIRAL HAEMORRHAGIC FEVERS (GL2016_002)

PURPOSE

The objectives of the *NSW Contingency Plan for Viral Haemorrhagic Fevers* are to provide guidance to support a coordinated response to the importation of suspected and confirmed cases of viral haemorrhagic fever (VHF), and to make recommendations on the appropriate management of cases and their contacts.

KEY PRINCIPLES

VHFs are severe and life-threatening viral diseases that are endemic to parts of Africa, the Middle East, Eastern Europe, and Asia. VHFs are of particular public health importance because they can spread via human-to-human contact in the community and particularly within hospital settings. They are often associated with a high case fatality rate as there are few if any effective treatments.

A single case of VHF constitutes a public health emergency. The management of a VHF patient requires considerable care to prevent further transmission in clinical settings and extensive public health action to identify and manage close contacts at risk of infection.

Contingency planning for VHFs aims to enable early diagnosis of VHF cases, to provide VHF patients with appropriate clinical care in a safe environment, and to prevent transmission to other people.

VHFs are notifiable infectious diseases and scheduled medical conditions under the NSW Public Health Act (2010). VHFs are also listed diseases under national biosecurity legislation and the International Health Regulations.

USE OF THE GUIDELINE

Chief Executives should ensure:

- Local protocols are developed based on the NSW Contingency Plan for Viral Haemorrhagic Fevers Practice Guideline
- Local protocols are in place in all hospitals and facilities which may be required to assess or manage patients with a VHF
- Ensure that all hospitals and facilities are appropriately resourced to safely assess, manage and, if indicated, transfer patients with a VHF
- Ensure that all staff treating patients are trained in the use of the NSW Contingency Plan for Viral Haemorrhagic Fevers Practice Guideline and locally developed protocols
- Ensure that clinical laboratory staff are educated in the use NSW protocols for the safe collection, transfer and testing of clinical specimens for VHF testing.

The full guidelines can be downloaded at
https://www1.health.nsw.gov.au/pds/Pages/doc.aspx?dn=GL2016_002

PANDEMIC PREPAREDNESS AND RESPONSE – ABORIGINAL COMMUNITIES (GL2019_009)

PURPOSE

This Guideline is a supporting document to the *NSW Health Influenza Pandemic Plan* (PD2016_016). It is intended to support Local Health Districts (LHDs) in implementing pandemic preparedness and response activity specifically related to Aboriginal people.

KEY PRINCIPLES

Aboriginal people in NSW are at a greater risk from morbidity and mortality during an influenza pandemic. Without specific consideration and preparedness, a future pandemic may exacerbate existing health inequalities in Aboriginal communities.

Pandemic planning requires close and ongoing partnerships with Aboriginal people and communities to develop effective and culturally appropriate strategies for reducing the risk of a pandemic. This Guideline outlines key issues in pandemic preparedness and responses that are specific to Aboriginal communities and which need to be addressed for pandemic planning at state, regional and local levels, in conjunction with key stakeholders. This Guideline:

- Describes the roles and responsibilities of key NSW stakeholders in the implementation of this guidance;
- Outlines the strategies that LHDs would be expected to consider when working with Aboriginal communities in pandemic planning;
- Provides guidance for LHDs over activity that should be considered at each stage of a pandemic in NSW
- Is a supporting Guideline to the NSW Health Policy Directive *Influenza Pandemic Plan* (PD2016_016).

This Guideline is also intended to inform the Aboriginal Health and Medical Research Council of NSW (AH&MRC), Aboriginal Community Controlled Health Services (ACCHS) and other relevant stakeholders about ways of working with LHDs in pandemic preparedness and during the response.

USE OF THE GUIDELINE

LHDs should use the attached Guideline to lead the planning and response to the pandemic at a District level, and collaborate with ACCHSs to determine appropriate health service models for local Aboriginal people and communities during a pandemic. Key considerations are the need to:

- Work in collaboration with ACCHSs, Aboriginal Community Leaders and Elders' groups, Local Aboriginal Lands Councils (LALCs) and any Local Decision Making (LDM) regional alliances
- Take a family centred approach towards prevention
- Provide culturally appropriate information for families and means of communicating the information
- Seek input from AH&MRC and/or ACCHSs to develop and disseminate health messages effectively, including information about why Aboriginal people may be prioritised for antiviral treatment and or vaccination
- Show respect and acknowledgement of the Aboriginal land or Country being entered when undertaking pandemic planning and during a pandemic.

The full guidelines can be downloaded at

https://www1.health.nsw.gov.au/pds/Pages/doc.aspx?dn=gl2019_009

MANAGEMENT OF PEOPLE EXPOSED TO A CONTACT ORDER CONDITION (PD2019_037)

PURPOSE

This Policy Directive provides a process for the management of people who have been exposed to certain serious infectious diseases that pose a threat to public health because they can be either rapidly spread in the community, have a high mortality rate, or in the case of typhoid, can be transmitted by people without symptoms through food handling.

These conditions are known as 'contact order conditions'. Persons who have been exposed to a contact order condition can be subject to a public health order under The Public Health Act 2010 (the Act).

This Policy Directive explains the process through which the health system may encourage, facilitate and, only if required, enforce compliance with recommendations to avoid certain behaviours and/or other quarantine requirements for people following exposure to a contact order condition.

Public health orders are measures of last resort to prevent a public health risk and, in the case of exposure to contact order conditions, are only used when voluntary quarantine recommendations are refused.

MANDATORY REQUIREMENTS

All staff involved in the management of people who have been exposed to a contact order condition must adhere to these principles.

IMPLEMENTATION

Chief Executives must ensure that:

- The principles and requirements of this policy are applied, achieved and sustained
- Relevant staff are made aware of their obligations in relation to the Policy Directive
- Documented procedures are in place to support the Policy Directive.

Clinicians:

- Must comply with this Policy Directive.

Management of People Exposed to a Contact Order Condition Procedures

1 BACKGROUND

About this document

This Policy Directive provides a process for the management of people who have been exposed to certain serious infectious diseases that pose a threat to public health because they can be either rapidly spread in the community, have a high mortality rate, or in the case of typhoid, can be transmitted by people without symptoms through food handling. These conditions are known as "contact order conditions". Persons who have been exposed to a contact order condition can be subject to a public health order under the Public Health Act 2010 (the Act).

The management framework established by this Policy Directive is based on the following principles and assumptions:

- The general public have the right to appropriate protection against the risk of serious communicable infections.

- A person exposed to serious communicable infection has an important role in preventing the further transmission of the infection.
- Effective quarantine permits early detection and clinical management of serious infections where they arise, and helps to prevent further transmission.
- Counselling can affect the person's behaviour and lessen the risk of transmission.
- A person's willingness to comply with quarantine requirements is influenced by a range of factors, including the degree and duration of the restrictions, their physical and mental health, and their social, housing, work and family circumstances and responsibilities.
- Any public health measure implemented should be proportional to the public health risk posed.
- Any restriction on the liberty of a person should be imposed only if it is the most effective way to prevent a risk to public health.

This Policy Directive explains the process through which the health system may encourage, facilitate and, only if required, enforce compliance with recommendations to avoid certain behaviours and/or enter quarantine requirements for people following exposure to a contact order condition.

Public health orders are measures of last resort to prevent a public health risk and, in the case of exposure to contact order conditions, are only used when voluntary quarantine recommendations are refused.

Key definitions

Authorised medical practitioner: means the NSW Chief Health Officer or a registered medical practitioner authorised by the Secretary to exercise the functions of an *authorised medical practitioner* under Division 4 of the Act.

Contact order condition: means one of the conditions listed in Schedule 1A of the Act as contact order conditions. These are reproduced in Table 1 below. More information about each condition and the related public health concerns are included in the Appendices.

Expiry period: means the maximum period which a person who has been exposed to a contact order condition can be subject to a public health order. The expiry period for each contact order condition correlates to the expected incubation periods for each condition.

Exposed
The term 'exposed' is used when a person has encountered a disease causing pathogen in a way that is judged to be sufficient for infection to take place. However, it is not necessarily the case that infection occurs. The criteria for a person to be judged to have been 'exposed' vary by the disease and are described in published public health control guidelines for each disease as 'contact definitions'. Public health authorities apply these criteria to contacts identified during investigations of people with the disease.

Incubation period: means the time period between when a person is exposed to a pathogen and the appearance of the first symptoms or signs of the condition caused by infection with the pathogen. It is assumed that if an exposed person has not developed the signs or symptoms of the condition by the end of the incubation period then they are no longer at risk of developing the infection from that exposure.

Table 1: The five contact order conditions listed in Schedule 1A with their expiry periods:

Condition	Expiry period
Avian influenza in humans	10 days
Middle East respiratory syndrome coronavirus	10 days
Severe Acute Respiratory Syndrome	10 days
Typhoid	14 days
Viral haemorrhagic fevers	21 days

Isolation: refers to the public health practice of separating ill people who have a serious communicable disease from those who are healthy. This enables treatment of the person to be provided while preventing exposure of well people.

Quarantine: means the limitation of freedom of movement of a person who may be infected with a disease, but who has not yet developed symptoms or signs. Quarantine continues until the incubation period for the disease expires. If a person in quarantine develops symptoms or signs of the disease then clinical management in isolation is arranged. Quarantine (and isolation) may be voluntary or enforced.

Legal and legislative framework

The amendments to the Act relating to contact order conditions came into force on 1 April 2018.

Division 4 of Part 4 of the Act details the powers and provisions related to public health orders for Category 4 and 5 conditions and public health orders made in respect to a person exposed to a contact order condition.

Under section 62(1)(b) of the Act, an *authorised medical practitioner* may make a public health order in respect of a person if satisfied, on reasonable grounds, that the person:

- has been exposed to a contact order condition, and
- is at risk of developing the contact order condition, and
- because of the way the person behaves, may be a risk to public health.

THE MANAGEMENT STAGES

The management of people exposed to a contact order condition begins with a voluntary stage that seeks to support the person to comply with recommendations to avoid certain behaviours and/or enter into voluntary quarantine. It only proceeds to consideration of a public health order if the person refuses to comply with some or all of these recommendations.

Management of typhoid contacts

For contacts of a person with a typhoid infection, the focus of public health measures is to restrict specific activities that have a higher likelihood of disease transmission, such as preparing food for others or caring for vulnerable contacts (e.g. child care work).

Contacts who are assessed to be at higher risk of transmitting infection because of occupational or personal characteristics are recommended to be excluded from work, school, and child care until they can be excluded as a typhoid case. Usually this is achieved after they provide two negative stool samples at least 24 hours apart. If feasible, they may undertake other duties (not high risk) while awaiting specimen results.

Other quarantine measures are unlikely to be recommended for typhoid contacts.

Voluntary quarantine

For contacts exposed to one of the listed contact order conditions (other than typhoid), it is important to stress the importance of quickly achieving appropriate[1] quarantine arrangements. This ensures that other people are not exposed to these serious conditions if a contact is already infectious or becomes infectious during the incubation period.

Counselling and support is an integral part of the management of all persons exposed to a contact order condition but it needs to be balanced with the public health imperative to rapidly implement disease control measures.

People exposed to a contact order condition should receive culturally and linguistically appropriate counselling to ensure that they understand the public health significance of their exposure and the importance of their compliance with quarantine. A professional interpreter should be used whenever relevant.

The person is to be managed in voluntary quarantine by the public health unit (PHU) of the relevant local health district (LHD), with additional support through the LHD. PHU staff must counsel the person and seek agreement for voluntary quarantine for the person. The LHD should identify and seek to overcome any barriers to quarantine (e.g. family, accommodation, employer, pet care). The PHU should identify whether other agencies may be able to assist, such as Aboriginal medical services when an Aboriginal person is identified as a contact.

The PHU must also provide documentation and information to the person explaining why voluntary quarantine is necessary, for how long it will last, how the person in quarantine can get support, and the possible consequences if voluntary quarantine is refused. This may include organising supporting letters from the PHU director for employers where required.

Daily contact is to be made by the PHU with the person in quarantine to monitor for signs or symptoms of infection, typically by phone. If concerns arise, the PHU must take action to organise appropriate investigation and isolation for the patient.

Health Protection NSW will provide expert advice to support the PHU.

Case conference and consultation

A case conference between the PHU and other local services involved in the care of the person is essential in addressing specific management issues, as well as developing a comprehensive quarantine and monitoring plan for that person. The Director, Communicable Diseases (HPNSW) should also be invited to attend.

Psychosocial assessment

A person's ability and willingness to comply with quarantine restrictions may be impacted by a range of factors, including housing and financial concerns, mental illness, real or perceived stigma, and competing responsibilities, including work, childcare, and education.

The LHD should support the PHU and work with appropriate agencies in order to overcome barriers to the person's non-compliance.

If voluntary quarantine is refused

In the event that a contact is not compliant with recommended quarantine and monitoring requirements in such a way that is endangering, or likely to endanger the health of the public, as a first step the PHU should counsel the person to ensure that he or she understands the public health consequences of refusal, and the power of an *authorised medical practitioner* to make a public health order.

[1] As assessed by the Public Health Unit Director.

The PHU should identify barriers and provide specific incentives (e.g. books, movies, games to overcome boredom) and other initiatives, such as further specialised counselling, or providing appropriate accommodation for quarantine.

The PHU may also deliver a formal letter from the PHU director that emphasises the importance of following the PHU quarantine recommendations and possible implications of refusing recommendations, such as a public health order. Before any formal warning letter is sent, Legal and Regulatory Services should be consulted.

In circumstances where counselling and support measures have failed to mitigate concerns that a person will not comply with quarantine requirements, more assertive management should rapidly be initiated.

A consultation by a public health physician and or infectious diseases physician should be organised to ensure that the person understands the public health significance of their exposure and the importance of their compliance with quarantine.

Additional support from HPNSW

The Director, Communicable Diseases Branch should also be consulted to consider the need to convene an expert panel, and other initiatives should be considered.

Where the PHU director is concerned about the compliance of a person exposed to a contact order condition they may seek advice from the Director, Communicable Diseases Branch regarding the potential to consult with the Executive Director, Health Protection and the Chief Health Officer.

The Chief Health Officer may choose to rapidly convene an expert panel to consider the circumstances, review the management of the contact and provide advice on additional or alternative strategies. In these circumstances, the management of the person remains the responsibility of the LHD.

Involuntary quarantine and public health orders

If a person refuses to comply with a recommendation to undertake voluntary quarantine according to the PHU's directions, then a public health order should be urgently considered.

Note that in the case of people considered contacts of a confirmed typhoid case, a public health order would usually only be considered for those contacts who are in a high risk occupational group, such as a food handler, and who have refused the recommendation to cease work until they have been confirmed to be non-infectious through stool screening. This includes where a high risk typhoid contact is refusing to submit a stool sample for testing.

The process for issuing a public health order would generally commence with a recommendation made by the PHU director to the Chief Health Officer, in consultation with the Executive Director, HPNSW. The Chief Health Officer may also convene an expert panel to advise on the need for a public health order and the specific provisions that would be included in the public health order, if supported.

A public health order is made by the Chief Health Officer (or other authorised medical officer). This would generally occur in consultation with the Executive Director, Health Protection and the Executive Director, NSW Ministry of Health Legal and Regulatory Services Branch.

Expert panel composition

The Chief Health Officer may convene an expert panel to provide expert advice on issues related to persons exposed to contact order conditions, including the need, if any, for a public health order to be issued.

The PHU director is responsible for presenting information about the source case and the contact to the expert panel. The expert panel reviews the public health management of the contact and recommends additional or alternative management strategies.

The core constitution of the expert panel includes:

- Chief Health Officer (Chairperson), who may delegate to Executive Director, Health Protection NSW
- Executive Director, Health Protection NSW
- Director, Communicable Diseases
- One or more infectious diseases physicians
- PHU director of another LHD.

Additional expert panel members are selected based on specific needs of the case, such as a social worker, a professional ethicist or a member of a relevant community or key support group. Clinicians managing the source case may also be consulted.

An expert panel may also be convened by Health Protection NSW on behalf of an LHD to provide advice on the local management of persons exposed to contact order conditions.

Conditions of a public health order

A public health order relating to exposure to a contact order condition may require the person subject to the order to do any one or more of the following:

- to refrain from specified conduct, e.g. to not make physical contact with other people or maintain a specified distance from others,
- to undergo specified treatment (whether at a specified place or otherwise),
- to undergo counselling by one or more specified persons or by one or more persons belonging to a specified class of persons,
- to submit to the supervision of one or more specified persons or of one or more persons belonging to a specified class of persons, (e.g. an infectious diseases physician or infectious diseases unit staff)
- to notify the Secretary of other persons with whom the person has been in contact within a specified period,
- to notify the Secretary if the person displays any specified signs or symptoms, to undergo specified testing for the relevant condition.

A public health order may authorise the person subject to the order:

- to be detained at a specified place for the duration of the order, or
- in relation to an order that requires the person to undergo specified treatment at a specified place—to be detained at that place while undergoing the treatment.

A public health order should specify who is responsible for managing the person subject to the order. This will generally be the Director of the PHU of the LHD where the person resides or an infectious diseases physician.

Making the public health order

An *authorised medical practitioner* may make a written public health order in respect of a contact order condition if satisfied on reasonable grounds that the person:

- has been exposed to a contact order condition, and
- is a risk of developing that contact order condition, and
- because of the way the person behaves, the person may be a risk to public health.

It would generally, time permitting, be expected that the *authorised medical practitioner* would be provided with advice from an Expert Panel to assist in this determination.

In deciding whether to make a public health order, the *authorised medical practitioner* must take into account:

- the principle that any restriction on the liberty of a person should only be imposed if it is the most effective way to prevent any risk to public health, and
- the matters set out in the Public Health Regulation 2012 (clause 39) being:
    - the options other than a public health order that are available to deal with the risk to public health posed by the person,
    - if the proposed public health order will require the person to undergo treatment—the availability and effectiveness of the proposed treatment and the likely side effects of the proposed treatment on the person,
    - if the proposed public health order will require the person to be detained— the likely social, economic, physical and psychological effects of the detention on the person.

The matters set out in the Public Health Regulation do not need to be taken into account in the case of an emergency or if it is otherwise not reasonably practicable.

Duration of the public health order

A public health order does not take effect until it is served personally on the person subject to the order.

A public health order must state that it expires at the end of the expiry period for the particular contact order condition, unless earlier revoked.

However, a public health order based on a contact order condition will expire at the end of 3 business days after the person subject to the order is served with the order unless, before it expires, the person is served with a copy of an application for its confirmation under section 64. If an application for confirmation is not served on the person within 3 business days, the order will lapse and the person should be notified that they are no longer the subject of a public health order and no action can be taken under the order (e.g. if the person is detained, the person must be released from detention). As soon as practicable after such an application is made, the Civil and Administrative Tribunal is to inquire into the circumstances surrounding the making of the public health order.

Following its inquiry, the Civil and Administrative Tribunal:

 may confirm the public health order, or may

vary the order and confirm it as varied, or may

revoke the order.

If the *authorised medical practitioner* considers that the person subject to the order is no longer a risk to public health, the *authorised medical practitioner* must revoke the order and immediately give notice in writing of the revocation to the person and the Civil and Administrative Tribunal.

Detention order

While any condition of a public health order will restrict a person's liberty and should only be used if it is the most effective way to prevent any risk to public, detention of a person seriously restricts a person's liberty. It would be expected to be a rare occurrence, and should only ever be considered as a last resort. Consideration should be given to using other conditions in a public health order, such as refraining from certain conduct, before detention is considered.

All LHDs should identify appropriate facilities and staff who are able to implement an order for secure detention under the *Public Health Act 2010*. See section 3 below.

Where the person to whom the public health order applies is already detained under a custodial sentence, consideration should be given to the unique circumstances of implementing the public health order, including:

- that client confidentiality, legal and safety issues be considered, and
- that quarantine/isolation measures may require negotiation with Justice Health, Corrective Services NSW and Juvenile Justice.

ACCOMMODATION

Voluntary quarantine

When accommodation is required for the purpose of voluntary quarantine of a contact who is medically stable, quarantine at the person's home or at a commercial residential environment is preferred.

LHDs must consider how best to accommodate contacts in such situations and ensure arrangements to monitor them in quarantine.
The NSW Ministry of Health may be able to assist LHDs with identifying suitable accommodation for contacts through its links with other government agencies.

Involuntary quarantine with a public health order

When accommodation is required for the purpose of involuntary quarantine, i.e. subject to a public health order, for a contact who is medically stable, quarantine at a person's home may not be appropriate. If a public health order includes an order for detention, the order will specify where the person is to be detained. If the place of detention is on LHD property, LHDs must consider how best to accommodate contacts in such situations so that quarantine can be enforced in accordance with the conditions of the public health order.
LHDs must:

- Identify a suitable location for accommodating a contact who is detained under a public health order. This location would be specifically named in the public health order.
- Develop a management plan addressing the needs of the contact.
- Provide adequate staff training.
- Assure the availability of appropriate secure facilities and processes, including the use of security personnel
  ('secure' in this context means the minimum additional security needed to ensure that the person does not injure themselves and does not attempt to leave the premises without authority).

People exposed to a contact order condition may have concurrent medical conditions or mental health concerns which can potentially be exacerbated by quarantine. LHDs should ensure that relevant expertise and services are available to safely and effectively manage such contacts.

The use of public hospitals as locations for the involuntary quarantine of medically stable contacts is not recommended but remains an option if no other suitable alternative can be found.

APPENDICES

The five contact order conditions are summarised below. For further information consult the NSW Health infectious disease website: http://www.health.nsw.gov.au/infectious .

Avian influenza in humans

Humans are at risk of infection with influenza viruses that are circulating in animals, particularly avian influenza viruses. If such a virus acquired the capacity to spread easily among people it could start an epidemic or pandemic.

Avian influenza viruses are the most diverse group of influenza viruses and are considered to be the most likely source of novel pandemic influenza viruses affecting human populations.

Humans with influenza infections typically have the virus appear in the respiratory tract in the 24 hours prior to the onset of illness. This means infected persons can be infectious to others through the respiratory route prior to feeling unwell.

A single case of human influenza caused by an avian influenza virus or other new subtype may constitute a public health emergency of international concern under the International Health Regulations (2005), and is required to be reported to the World Health Organization (WHO). Infection with avian influenza also meets the criteria for a listed human disease under the Australian Biosecurity Act, in the category *human influenza with pandemic potential*.

Middle East respiratory syndrome coronavirus

Middle East respiratory syndrome (MERS) is a serious infection caused by the MERScoronavirus (MERS-CoV). In humans, MERS-CoV infection is mainly associated with respiratory infections and can lead to severe disease, particularly in older people and in people with underlying medical conditions. Since it was first identified in 2012, case fatality rates have been approximately 35%.

Camels are the major animal source of MERS-CoV infection in humans but the majority of human cases of MERS have been attributed to person to person spread of the infection in health care settings.

While the MERS-CoV virus does not currently pass easily from person to person, transmission has been well documented following close contact, such as occurs when providing unprotected care to a patient. Hospital-associated outbreaks have occurred in several countries, with the largest outbreaks seen in Saudi Arabia, United Arab Emirates, and the Republic of Korea.

While most cases transmit the infection to few other people, there have been a number of well documented incidents where a single infected person has been linked to a large cluster of new infections. Rapid implementation of droplet and contact precautions has been effective in preventing further spread and controlling outbreaks.

A single human case of MERS-CoV infection may constitute a public health emergency of international concern under the International Health Regulations (2005), and would usually be reported to the World Health Organization. This would also be considered a listed human disease under the Australian Biosecurity Act, in the category *Middle East respiratory syndrome*.

Severe Acute Respiratory Syndrome

Severe acute respiratory syndrome (SARS) is a serious infection caused by the SARScoronavirus (SARS-CoV). In humans, SARS infection is mainly associated with respiratory infections and can lead to severe disease.

Case fatality rates during the 2002-2003 global outbreak of SARS ranged from 7% to 17% but were as high as 50% in older people and in people with underlying medical conditions.

The spread of SARS between humans is thought to have occurred mainly through the respiratory route but also by direct contact and fomite transmission. While most cases transmitted the infection to few other people, there were a number of well documented ‘superspreading events’ where a single infected person was linked to many new infections. Rapid implementation of droplet and contact precautions was effective in preventing further spread and controlling outbreaks.

There has been no or very limited person to person spread of SARS since 2002-2003, but there remains a risk that the virus could be re-introduced to human populations from an animal reservoir, most likely certain bats species in Asia.

A single human case of SARS infection may constitute a public health emergency of international concern under the International Health Regulations (2005), and is required to be reported to the World Health Organization. This would also be considered a listed human disease under the Australian Biosecurity Act, in the category *severe acute respiratory syndrome*.

Typhoid

Typhoid is a febrile illness caused by infection with *Salmonella* Typhi bacteria which can cause severe disease. Without treatment the case fatality rate is approximately 15%. Asymptomatic and mild infections also occur.

The time from contact with the typhoid bacteria to the start of symptoms (incubation period) is usually from 8 to 14 days but can rarely be as long as 60 days. The bacteria that cause typhoid are found in the faeces of infected people.

If left untreated, about 10% of typhoid fever patients will excrete the bacteria in their faeces for three months after the onset of symptoms and 3-5% become chronic carriers.

Transmission occurs via the faecal-oral route, usually when faecally-contaminated food or water is ingested. Transmission from infected persons prior to the onset of illness has been documented and is a particular risk for infected food handlers who may put large numbers of people at risk.

Close contacts of typhoid cases are considered at higher public health risk if their work involves food handling or caring for children, hospital patients or the elderly. Public health guidelines state that contacts in these high risk groups must not work until they have had two stool samples, taken at least 24 hours apart, test negative for typhoid, showing that they are not infectious.

Viral haemorrhagic fevers

Viral haemorrhagic fevers of serious public health concern include infections caused by Ebola viruses, Marburg virus, Lassa fever virus and Crimean-Congo haemorrhagic fever virus. Infections tend to be severe and often fatal. For example, outbreaks of Ebola virus disease in African countries have had case fatality rates of 50% or higher.

The mode of transmission depends on the particular virus and in the particular country in which it is endemic. In Australia, infections would most likely be brought in through an infected traveller and be spread through direct contact with infected blood or body fluids.

A single human case of a VHF infection may constitute a public health emergency of international concern under the International Health Regulations (2005), and would usually be required to be reported to the World Health Organization. This would also be considered a listed human disease under the Australian Biosecurity Act, in the category *viral haemorrhagic fevers*.

SURVEILLANCE AND MANAGEMENT OF CARBAPENEMASE-PRODUCING ENTEROBACTERALES (CPE) IN NSW HEALTH FACILITIES (GL2019_012)

PURPOSE

This guideline is designed to assist public health care facilities in NSW to:

1. Identify suspected cases of Carbapenemase producing *Enterobacterales* (CPE)1
2. Implement control measures to prevent transmission of CPE
3. Understand the local epidemiology of CPE.

While this Guideline has been written specifically for CPE, recommended measures may also be applicable to any species of multidrug-resistant *Enterobacterales* (MDR-E) and other carbapenemase producing organisms (CPO). The local decision whether to apply to other MDR-E and CPO is to be made in consultation with content experts.

As evidence for recommendations continues to emerge, recommendations will be reviewed and revised when significant new findings are available.

KEY PRINCIPLES AND USE OF THE GUIDELINE

Identify CPE cases

- Conduct a risk assessment to identify people who should be screened for CPE at admission
- Screen patients for CPE at admission if a case contact, if flagged or if admitted to a healthcare facility or aged care facility overseas in the last 12 months
- The minimum requirement for admission screening is one rectal swab or faecal sample
- Screening during hospital admission may also be indicated in additional clinical scenarios, based on local risk assessment

Manage CPE cases

- Implement contact precautions for patients with suspected or confirmed CPE
- Inform health care providers of patients with suspected or confirmed CPE
- Educate the patient and their family on CPE and how to prevent transmission
- Place alerts in patient medical records for patients with suspected or confirmed CPE
- Routinely manage all CPE cases under contact precautions for subsequent admissions

Manage contacts of CPE cases

- Identify contacts of all suspected and confirmed CPE cases
- Screen contacts of all confirmed CPE cases
- For contacts that have already left the health care facility, place alerts in patient medical records to prompt screening when the patient is readmitted

Manage local transmission of CPE

- When local transmission of CPE is identified, convene a CPE outbreak management team
- Investigate the cause of the local transmission
- Implement strategies to limit further transmission
- Report local transmission to the Clinical Excellence Commission (CEC)

The complete Guideline is available at:
https://www1.health.nsw.gov.au/pds/Pages/doc.aspx?dn=GL2019_012

316(16/08/19)

1 This document uses the collective term *Enterobacterales*, rather than *Enterobacteriaceae*. Recent taxonomic studies have narrowed the definition of the family *Enterobacteriaceae*. *Enterobacteriaceae* are one of seven families in the *Enterobacterales* order. When the abbreviation CPE is used in this document, it refers to carbapenemase producing *Enterobacterales*.

TRIGGERS FOR ESCALATION FOLLOWING DETECTION OF INFECTION OUTBREAKS OR CLUSTERS (GL2019_013)

PURPOSE

This Guideline has been developed to support NSW public healthcare facilities with effective and timely escalation of information on outbreaks or clusters of healthcare associated infections, multidrug-resistant organisms (MROs) and/or non-MROs.

KEY PRINCIPLES

NSW public healthcare facilities must have written procedures that address the outbreak management requirements for common communicable diseases and MROs (e.g. gastroenteritis, influenza, Carbapenemase-producing *Enterobacterales*) and identify delegations of responsibility during the outbreak (Infection Prevention and Control Policy).

A framework for escalating outbreaks and clusters with effective and timely management will ensure minimal impact and when adhered to guide future assistance.

This Guideline provides a tool to assist NSW public healthcare facilities with developing local escalation frameworks or protocols that are tailored to their needs and available resources.

USE OF THE GUIDELINE

Chief Executives should ensure that

- This Guideline is implemented in healthcare facilities where there is or may be a risk of an outbreak or cluster of infection
- Health workers are made aware of the escalation process for outbreaks and clusters of infection
- There is adequate resourcing for the response to an outbreak or cluster of infection.

Health workers should escalate outbreaks or clusters of infection as per the local escalation framework or protocol.

The complete Guideline is available at:

https://www1.health.nsw.gov.au/pds/Pages/doc.aspx?dn=GL2019_013

EARLY RESPONSE TO HIGH CONSEQUENCE INFECTIOUS DISEASES
(PD2023_008)

POLICY STATEMENT

NSW Health coordinates a central, specialised response during the initial stage of high consequence infectious disease management, in order to mitigate the risk of public health emergency and associated healthcare system impacts.

SUMMARY OF POLICY REQUIREMENTS

High consequence infectious diseases have the potential to significantly impact individual and population health, and can in turn pose a risk to the delivery of healthcare services. A specialised, centrally coordinated response is required to ensure effective clinical management and containment of such diseases.

This Policy Directive details the NSW Health operational response to the early phase when there is limited or no transmission in the community including the function of: the Statewide High Consequence Infectious Disease service, the Physical Containment Level 4 (PC4) High-Security Laboratory at NSW Health Pathology Institute of Clinical Pathology and Medical Research, and a summary of strategic and planning activities that need to occur in the initial phase should case numbers be expected to rise.
inf
The roles and responsibilities of all parties involved in a centrally coordinated response are outlined in this Policy Directive.

Local Health Districts, Specialty Health Networks and pillars of NSW Health are required to ensure relevant planning and clinical staff are familiar with the Policy Directive and make any local preparations necessary to guarantee adherence to the roles and responsibilities described, in the event of a high consequence infectious disease case presentation.

The Policy Directive includes direction on key response actions such as communication, enhanced surveillance, laboratory diagnostic testing, clinical management, infection prevention and control processes, and acquisition and distribution of key treatments and equipment.

Different immediate patient flow and referral actions are detailed for identification of potential high consequence infectious disease patients at international borders, general practitioner or specialist rooms, and hospital facilities.
